When a population reaches equilibrium, the numbers are kept at a steady level by factors such as competition for food, refuge, or space. These factors are said to be density-dependent because greater numbers in the population intensify the competition and increase mortality, lower numbers decrease competition and favour survival. Abundance is therefore regulated by density-dependent processes arising from interactions, first, between individuals making up the population, and secondly, between the population under consideration and other populations whose members may be competitors, predators, or food. The level of abundance at which this regulation occurs may vary greatly and will be determined, at least in part, by general environmental factors such as temperature, rainfall, amount of sunlight, the nature of the vegetation, and so on.

Human population is increasing rapidly at the present time, mainly because of the fall in death-rate. Food production is also increasing, but in some areas of the world supply and requirement are so evenly matched that drought or war are inevitably followed by a famine. Though the human population has not yet reached the stage of equilibrium, it is clear that ultimately it must be subject to forces of regulation similar to those that control populations of other organisms. Birth-rate cannot exceed death-rate indefinitely in any living organism. By limiting the size of families it is possible for man to achieve a population equilibrium at levels lower than those at which regulative factors such as famine or aggression must begin to operate. Rational control of birth-rate seems to offer the best chance of averting a global population disaster.

THE GEOLOGICAL RECORD.

The various stages in the history of the earth can be read by the geologists in the strata or layers of rock laid down since the planet began to solidify, and it is in these rocks, too, that the record of life upon earth may be traced.

No Life Rocks.—The earliest rocks in the record are known as the Azoic (no life) rocks, because they show no trace of living things, and these layers are of such thickness that they occupy more than half of the whole record. That is to say, for more than half of the earth's history nothing living existed upon any part of the globe. For millions of years the surface of our planet was nothing but bare rock without soil or sand, swept by hot winds exceeding in violence the wildest tornadoes of today, and drenched by torrential downpours of tropical rain which, as we have seen elsewhere, gradually tore away the surface to form sandy sediments at the bottom of the seas. In such ancient rocks pushed above the surface by later upheavals we can still trace the marks of primeval oceans as they rippled upon the barren shores or of raindrops which left their imprint perhaps 1,500 million years ago.

Primitive Sea-life.—As we move upwards through the strata, however, traces of life begin to appear and steadily increase as we come to the more recent levels. The earliest signs appear in what is known as the Early Paleozoic Age (or by some writers as the Proterozoic Age), when we find the fossilised remains of small shellfish, seaweeds, and trilobites—the latter were creatures somewhat like the plant-lice of modern times. All these primitive animals and plants lived in the shallow tidal waters of ancient seas; for as yet life had not invaded either the dry land or the deep oceans. It is, of course, clear that these creatures of Early Paleozoic times were not the first living things; they were merely the first creatures capable of leaving fossilised remains, and without doubt must have had more primitive ancestors—amœbic-like forms, jellyfish, bacteria, and so on whose bodies were too soft to leave any traces in the record of the rocks.

The Age of Fishes.—Towards the end of the Early Paleozoic Era, in what we now know as the Silurian period, there arose a new form of life: the first backboned animals, primitive fishes somewhat similar to the sharks of today; and in the division of the Upper Paleozoic Era known as the Devonian, they had come to multiply so greatly that this is frequently described as the Age of Fishes.

First Land Animals and Plants.—It is about this time, too, that we begin to find traces of animal and plant life upon the dry land. Both animals and plants had acute problems to solve before it became possible for them to live out of water; for both animals and plants had hitherto been supported by the surrounding water and respired by removing oxygen dissolved in the water. In land animals this problem was solved by a long series of adaptations from gills to lungs. Plants were able to invade the land because of the evolution of an impermeable outer cuticle which prevented water loss and also the development of woody tissues which provided support and a water-conducting system for the whole plant body.

Amphibia and Spore-bearing Trees.—The first type of vertebrates (backboned animals) to live upon dry land was the group of amphibia in the Carboniferous Age, which is today represented by the newts, frogs, toads, and salamanders. In

THE GEOLOGICAL TIME SCALE

ERAS	PERIODS	AGE (millions of years)	LIFE
CAENOZOIC	Pleistocene	1	Man
	Pliocene		
	Miocene	25	Birds, Mammals and modern plants
	Oligocene		Molluscs
	Eocene	70	
MESOZOIC	Cretaceous	135	Dinosaurs, Cycads; Earliest Birds; Ammonites and Sea-urchins
	Jurassic	180	
	Triassic	225	
PALAEOZOIC	Permian	270	First mammals; Early reptiles
	Carboniferous	350	Amphibians, tree-ferns, first insects
	Devonian	400	Fishes, first land plants
	Silurian	440	Mainly invertebrate animals; no life on land. Trilobites and graptolites
	Ordovician	500	
	Cambrian	600	
PRE-CAMBRIAN (also PROTEROZOIC, ARCHAEOZOIC)		2,000	Life emerges
		4,750	Age of Earth

all these forms the eggs give rise to a tadpole stage with gills which lives for some time entirely in water. Later the gills give place to a primitive form of lung which enables the animal to live upon land. Even so, amphibia are restricted more or less to swampy or marshy land, and without a damp environment they would dry up and shrivel to death. The most abundant forms of plant life in the Carboniferous period were the tree-like horsetails, clubmosses, and ferns, the fossilised tissues of which are found in the coal measures and are burned as household coal. But these plants also, as in the case of the amphibia, could exist only amongst the swamps and marshes, and life, although it had freed itself from the necessity of existence in the waters of the earth, still had to return to the water in order to reproduce itself. The highlands and the deeper waters of the planet were still empty of living things. Although the Carboniferous period had been a period of warmth and abundance, the Paleozoic Era came to an end with a long cycle of dry and bitterly cold ages. Such long-term climatic changes were due, it is now supposed, to such factors as changes in the earth's orbit, the shifting of its axis of rotation, changes in the shape of the land masses, and so on. Long before the Ice Ages of more recent times, there are records in the rocks of alternating periods of warmth and cold as far back as the Azoic and Early Paleozoic Eras. This long cold spell at the close of the Paleozoic era came to an end about 220 million years ago, and was succeeded by a long era of widely spread warm conditions—the Mesozoic Era, the so-called Age of Reptiles.

The Mesozoic Era.—The reptiles first appeared in the Permian, but it was during the Mesozoic era that they became the dominant group of animals. The giant reptiles included the stegosaurus, the gigantosaurus, the diplodocus, and many other kinds which were far larger than any land animals living today. Some, for example the diplodocus, were 100 ft. long, although they were vegetarian in habit and were preyed upon by other almost equally huge flesh-eating reptiles. Some species, such as the plesiosaurs and icthyosaurs, became secondarily aquatic, while the pterodactyl possessed wings with which it could glide and perhaps fly short distances. However, they all differed from the amphibia in that they had hard, dry skins, their lungs were more efficient, fertilisation was internal due to the development of copulatory organs, and they laid eggs with hard, protective shells.

It was also during the Mesozoic era that the warm-blooded birds arose. The birds, like the reptiles, lay eggs with hard shells, and they have several internal features found in the reptiles. The fossil bird Archæopteryx, three specimens of which have been found in Germany, lived in the Jurassic period. Although it was obviously a bird, it retained many reptilian features. Earliest mammals are recognised in rocks of the late Palaeozoic but in the Mesozoic considerable evolution of the group took place. The fossil Trituberculata which are also found in the Jurassic, are believed to be related to forms from which both the marsupial and placental mammals arose. Although insects were present as far back as the Carboniferous, it was in the Mesozoic that many of the groups we know today first appeared.

Great changes also took place in the plant cover of the land during this era. The spore-bearing giant horsetails and tree clubmosses declined and were replaced by gymnosperms—trees bearing naked seeds. One large group of these, the cycadeoids, has become extinct, but the conifers and a few of the once abundant cycads still remain. The flowering plants or angiosperms also made their appearance, and towards the end of the Cretaceous their evolution was extremely rapid. In fact, many of the fossil leaves found in rocks of Cretaceous age are indistinguishable from those of some present-day flowering plants.

A New Era.—But, perhaps 150 million years later, all this seemingly everlasting warmth and sunshine, the lush tropical life, the giant reptiles who had ruled the world, were wiped out by a new period of bitter cold which only the hardy species could survive. A new Era known as the Caenozoic was beginning, ushered in by a period of upheaval and volcanic activity, following which the map of the world came to resemble more closely the picture we know today. The cold period may have lasted several million years, and the main species to survive it were those which had come into existence towards the end of the Mesozoic Era, the seed-bearing flowering plants, the birds, and the mammals. The once all-powerful reptiles from this time onwards are represented only by the comparatively few and relatively small reptilian species of today: the snakes, lizards, crocodiles, and alligators. It was at this time, too, that, long after the creation of the mountains of Scotland and Norway (the so-called Caledonian revolution), or even of the Appalachian mountains (the Appalachian revolution), there arose the great masses of the Alps, the Himalayas, the Rocky Mountains, and the Andes. These are the mountain chains of the most recent, the Caenozoic revolution. Initially, as we have seen, the climate of the Caenozoic Era was cold, but the weather grew generally warmer until a new period of abundance was reached, only to be followed at the end of the Pliocene by a period of glacial ages generally known as the First, Second, Third, and Fourth Ice Ages.

THE EVOLUTION OF ORGANISMS.

Introduction.—It is commonly thought that the great 19th cent. naturalist Charles Darwin was the first person to suggest that life had continually evolved. However, the idea that species of living organisms could change over long periods of time was considered by some Greek writers and, much later, by the Frenchmen Buffon and Lamarck at the end of the 18th cent. Further, the work of the 18th cent. geologists such as James Hutton and William Smith provided a basis without which Darwin's contribution would have been impossible. Hutton showed that the earth's surface had undergone prolonged upheavals and volcanic eruptions with consequent changes in sea level. This implied that the earth was much older than had previously been supposed. Smith developed a method of dating the geological strata by means of the fossils found in them and demonstrated that widely different types of animals and plants existed at different periods of the earth's history. As described in the previous section a general picture is presented of the evolution of organisms from the simple to the complex and from the aquatic to the terrestrial environment. These discoveries were in conflict with the Biblical account in the book of Genesis and, although various attempts were made to explain them away or discredit them, it became abundantly clear that through millions of years life has been continually changing, with new species constantly arising and many dying out. Before considering Darwin's major contribution to the theory of evolution it will be appropriate to outline briefly the various lines of evidence which indicate that, in fact, evolution has taken place.

The Evidence for Evolution.—

1. *The Geological Record.*—It has already been pointed out that successively younger rocks contain fossil remains of different and relatively more complex organisms. The spore-bearing plants preceded the gymnosperms and the angiosperms arose much later. Similarly in the vertebrate series the fish appeared before the amphibia which were followed by the reptiles and later by the air breathing, warm-blooded birds and mammals. On a more restricted level the rocks provide even greater support for the occurrence of evolution. For example, the evolution of the horse has been worked out in great detail from the small Eohippus which was about a foot high and had four digits on the forefeet and three on the hind feet to the large one-toed animal living today. However, such complete series are rare and the geological record is very incomplete. There are a number of gaps, particularly between the major groups of organisms. No satisfactory fossil evidence is known of the ancestors of the angiosperms (F40) and although some may be discovered it could be that they did not grow in conditions which favoured

their preservation as fossils. On the other hand, Archæopteryx provides an indisputable link between the reptiles and the birds.

Another important point should also be made about the geological record. Although we talk about the age of fishes, the age of reptiles and so on it must be emphasised that these are the periods during which particular groups were abundant or even dominant. Each group probably originated many millions of years before it became widespread. Further, some groups, such as the giant reptiles and the seed-ferns, died out completely whereas others, the fishes and true ferns for example, are still common today. However, even in the latter groups there is evidence that they have continued to evolve so that many fishes and ferns that exist today are very different from those of the Devonian and Carboniferous periods (F45). On the other hand, the geological record also shows that some species, for example the Maiden-hair tree, have remained unaltered for many millions of years.

2. *Geographical Distribution.*—Nearly all the marsupials or pouched mammals are found in the Australian continent which was cut off from the mainland about 60 million years ago. All the fossil evidence indicates that at that time the eutherian or placental mammals did not yet exist. The marsupials are the only naturally occurring mammals in Australia (F33(2)) but since the isolation of the continent the group has given rise to a large number of species very similar in appearance to those which evolved elsewhere in the world among the eutherian mammals. There are marsupials which look like wolves, dogs, cats and squirrels; yet they have no close biological relationships to these animals. Further, some marsupials such as the kangaroos have evolved which are unlike any other creatures in the rest of the world. Quite clearly the isolation of Australia so long ago has resulted in the evolution of these distinct types. A similar small-scale effect of isolation was studied by Darwin in the Galapagos islands where each has its own distinct flora and fauna which differ also from those of the S. American mainland.

3. *Anatomy.*—The comparative study of the development and mature structure of the mammalian body provides much evidence that all the species have evolved from a single ancestral stock. Although the arm of an ape, the leg of a dog, the flipper of a whale and the wing of a bat appear very different externally they are all built on the same skeletal plan. It would be difficult to explain such similarities unless they had all evolved from a common type. There is also evidence that the early development of an animal recapitulates its biological history to a certain extent. For example, the gill slits found in fish are formed during the early stages in the development of a mammal although later they disappear. Finally, apparently useless vestigial structures sometimes occur which would be inexplicable unless regarded in the light of an evolutionary history. In man a small appendix and vestiges of a third eyelid occur but these are functionless although in other animals such structures are well developed and functional, *e.g.*, the appendix in the rabbit.

4. *Human Selection.*—During his brief history on earth modern man has continually selected and bred animals and plants for his own use. We have only to look at the various breeds of dogs which have been developed from a single wild type to see that under certain circumstances great structural divergence can occur in a species even in a relatively short time.

The Darwinian Theory of Evolution.—Darwin amassed a great deal of information such as that outlined above which convinced him that evolution of life had taken place over millions of years. His was the first real attempt to collect all the evidence scientifically and no other satisfactory alternative explanation of all the facts he presented has been proposed. Perhaps even more important was his attempt to explain *how* evolution had actually occurred. He published his theory after many years of work in his book *The Origin of Species by Means of Natural Selection* in 1859. Some of his ideas have since been modified owing to our increased knowledge of genetics but they are so important that it is worth while recounting the main points of his theory.

1. *The Struggle for Existence.*—It is clear that in nature there is a severe struggle for existence in all animals and plants. Over a period of time the number of individuals of a species in a given community does not vary greatly. This implies that the number of progeny which survive to become mature breeding individuals more or less replaces the number of mature ones that die. Generally speaking the reproductive output of a species is much greater than this. For example, a single large foxglove plant may produce half a million seeds each one of which is potentially capable of giving rise to a new individual. Obviously nearly all the progeny die before reaching maturity and the chance of any single one surviving is very remote.

2. *Variation.*—The individuals of any generation of human beings obviously differ from one another and such differences are found in other organisms. No two animals of the same species (except perhaps for identical twins) are exactly alike and when a large number of individuals are examined it is clear that they vary considerably in structure, colour, activity and so on. Darwin also pointed out that generally these variations were passed on from one generation to the next, for example, the children of tall parents tend to grow tall.

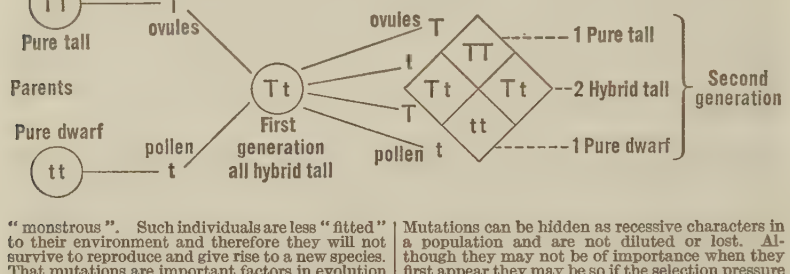
3. *Survival of the Fittest.*—If there is an intense struggle for existence in their natural environment among individuals of a species having different characteristics, those which are best "fitted" to a given set of conditions are most likely to survive to maturity. These will reproduce and the features which enabled them to survive will be passed on to their offspring. This process is liable to continue and a species will become better adapted to its environment.

4. *Natural Selection.*—Over a long period of time the environment of a given species is never stable but will change in various ways. As it does so the characters which best fit the individuals to the changed environment will be selected (not consciously of course) and the species will change. The environment may change only in part of the range of the species and thus lead to divergence and the production of a new species alongside the old one. *See also* F53(2).

Darwin and Lamarck.—Darwin pictured evolution as a slow continuous process with natural selection operating on the small inheritable variations found between the individuals of a species which are undergoing intense competition. This neglects the important effect of the environment on the growth and structure of the individual. It is obvious that external conditions will affect the development of an organism, for example the effect of various soil conditions on the growth of a plant or the amount of food material available to an animal. Lamarck maintained that the characters acquired by an individual owing to the effect of its environment could be passed on to its offspring. Undoubtedly characters are acquired by the individual during its growth but in spite of many attempts to prove otherwise no experiments have been done which prove conclusively that these are inherited by the offspring. Thus Lamarck's theory that evolution has occurred by the inheritance of acquired characters is not generally acceptable today.

Mutation Theory.—The data accumulated by Darwin showed that the variations between individuals of a species are small and graded into one another. If a particular character in a group of individuals is measured it is found that it varies symmetrically about a mean or average, with most values clustered about the mean and with few extreme ones. Darwin himself was worried about this fact because, although selection over a long period of time might shift the position of the mean,

he did not see how it could bring about the discontinuity necessary for the establishment of a distinct new species. De Vries in his *Mutation Theory* published in 1901 put forward the view that evolution depends, not on the accumulation of continuous minute variations, but primarily upon large discontinuous variations or mutations. The importance of such spontaneous "sports" was considered by Darwin but he rejected the idea because when they appear they are usually "monstrous". Such individuals are less "fitted" to their environment and therefore they will not survive to reproduce and give rise to a new species. That mutations are important factors in evolution is undoubtedly true but modern work has shown that the whole problem is far more complex than either Darwin or De Vries supposed. *See* F53(2).



Mendelism.—It is remarkable that in spite of carrying out many careful experiments on inheritance in plants Darwin did not discover the simple laws which are the basis of modern genetics. Mendel investigated inheritance in the garden pea and published his results in 1865, *i.e.*, at the time that Darwin's work was being widely discussed. However, Mendel's important discoveries were not generally known until 1900. When he crossed a pure breeding tall plant with a pure breeding dwarf plant all the progeny were tall. When these plants were self-pollinated the next generation consisted of approximately one quarter dwarf plants and three quarters tall. From this and similar experiments Mendel deduced that the "factors" passed from parents to offspring were paired, only one of the pair came from each parent and that one could be dominant over the other. When he dealt with two pairs of characters, *e.g.*, tall or dwarf plants and round or wrinkled seeds, he found that they segregated and recombined independently and in predictable ratios.

The importance of Mendel's work in relation to evolution is that it showed that there was no blending of the characters in the offspring. Mutations can be hidden as recessive characters in a population and are not diluted or lost. Although they may not be of importance when they first appear they may be so if the selection pressure changes and they become of survival value. Thus specific characters may change or diverge and evolution will take place. His investigations also showed that recombination of factors could give rise to plants with new characteristics. By crossing a pure bred tall plant having round seeds with a dwarf plant having wrinkled seeds he produced in the second generation some tall plants with wrinkled seeds and dwarf plants with round seeds. When a large number of characters are involved it is obvious that considerable variation and recombination occurs upon which natural selection can work.

Mendel was fortunate in his choice of experimental material with its easily recognisable contrasting characters. It is now known that his "factors" are the genes carried by the chromosomes in the nucleus of the cell. At the present time the biochemical basis of heredity is being vigorously investigated. *See* F31.

V. SCIENCES OF MAN

A biologist interested in classification might supplement the account of the animal kingdom in Part IV with the following further description of Man:

> "Man is a member of the order of Primates which is sub-divided into two sub-orders: Prosimii and Anthropoidea. The Prosimii include the lemurs and the Tarsier; the Anthropoidea include the monkeys, the apes and man. The anthropoid apes form a family called Pongidae and the extinct and living forms of man together constitute the family Hominidae. Although these two families constitute one superfamily, the Hominoidea, there are many differences between them in both body form and function. Apes progress by over-arm swinging in trees and they are usually quadrupedal on the ground; hominids habitually stand and walk upright."

But human beings have many remarkable attributes and it is not surprising therefore that besides biologists, scientists of many kinds contribute to the study of man. Even anthropology, which literally means "the study of man" is not a single well-defined science but has become diversified into a number of parts which have complicated connections with biology, archaeology, sociology, history, psychology, and many other studies. Physical anthropology, with which we shall deal first, is much concerned with the description of those physical characteristics of man which distinguish race from race, and man from animals. Such a study is important if we are to learn how man evolved. To describe physical characteristics quantitatively, suitable measurements must be made, *i.e.*, we must have techniques of anthropometry (man measurement). Physical measurement of the body cannot however exhaust the study of man, and therefore we shall also look at some of the current ideas of social anthropology which is one of a number of disciplines concerned with the study of man in society. There we shall stop, not, of course, because there are no further aspects to consider. Psychology, with its many different approaches, is the study of mind, and something of the nature of mind and mental development will be found in Section Q.

PHYSICAL ANTHROPOLOGY.

Man's Primate Ancestry.

Fossil Primates.

During the Eocene period, some 50 to 40 million years ago, the earth's climate was generally warmer than it is today and the extensive tropical forests housed many lower primates, the Prosimians, some of which (*e.g.*, Notharctus) resembled the modern lemurs and others (*e.g.*, Necrolemur) the modern Tarsius. In all some 28 species have been described from Europe and some 41 from North America. The ancestors of the higher primates, the Anthropoidea, must have been derived from members of this great Prosimian fauna, probably from the large family of Omomyidae such as Hemiacodon

which radiated widely in the Eocene. The Anthropoidea were later to occupy most of the available ecological niches, for the Prosimians disappear abruptly from the fossil record at the end of the Eocene, about 40 million years ago and are hardly found again until the present. No Anthropoidea existed in the Eocene but by the middle of the Oligocene, about 35 million years ago, fragments of several different types of Anthropoidea are found. It seems that the monkey and ape lines were already differentiated at that time. Parapithecus, found in Egypt, is probably near the ancestor of the monkeys who, from the Oligocene onwards have evolved as a line or lines distinct from our own.

The ape-man stock probably diverged from that of the monkeys during the Oligocene period some 35–25 million years ago. The Oligocene Aeliopithecus is quite like the gibbon and Propliopithecus could be close to the lineage of the other modern apes and man. Remains of apes are fairly common from Miocene deposits in many parts of the world and their appearance is tentatively correlated with climatic and other ecological features. Cooler and drier conditions than hitherto prevailed during the Miocene and many forest areas were replaced by grassy plains and savannah. The relevance of these changes to the evolution of apes is not very clear but many primates which had proliferated in the congenial circumstances of the extensive forests doubtless became extinct while others adapted to the new environment and became the ancestors of later, novel primate forms. The remains of many hundreds of Miocene and Pliocene apes which have been discovered from Europe, Asia, and Africa have been given a bewildering diversity of names which may usefully be summarised into the following categories: (1) Pliopithecus (Limnopithecus); (2) Dryopithecus (Proconsul, Sivapithecus, Bramapithecus); (3) Ramapithecus (Kenyapithecus). Members of the first group were near to the ancestors of the gibbons, those of the second to the other apes, and those of the third to man.

Ramapithecus has been found in late Miocene deposits in India and Kenyapithecus (dated at 14 million years old by the Potassium–Argon method) is approximately contemporary. It is very significant that in these fossils the arcade of the jaw is rounded, the canines small, and the incisors probably small and spatulate. From these features it may be deduced that the front teeth were no longer used for tearing the food and that this was the function of the hands freed by bipedalism for this task. Such deductions are tentative but Ramapithecus certainly provides a possible link between the definitely ape-like Dryopithecus and the later Pliocene and Pleistocene hominids. Without doubt Ramapithecus is close to the ancestral line of man proper. He may well have walked upright as Australopithecus virtually certainly did but some 10 million years later.

Man's Distinctive Attributes.

Man has been variously defined as a large-brained hominid, as a bipedal hominid and also as a maker of tools to a set and regular pattern. These criteria imply both morphological and functional attributes. In tracing man's ancestry we do not find all of these characteristics appearing simultaneously. The further back in time we proceed, the fewer of these attributes are recognisable. Bipedalism is an early feature; the other attributes were to follow later.

The Australopithecinae.

These creatures probably lived during the Pliocene and Lower Pleistocene periods. For many years controversy raged as to whether they were to be classified as Pongid or as Hominid. Many dental features, for example, indicate their hominid affinities and they were, moreover, bipedal. However, their brains were very small and fall within the Pongid range. They might well have used tools, a widespread propensity among many Primates, but it is far less likely that the South African forms were capable of making tools in the manner described. It may well be that the use of bones, teeth and wood as tools might long have predated the use of more durable stone artifacts. On balance, however, the Australopithecinae might be described as the earliest Hominids.

Many fossil remains of the Australopithecinae have been found and they have been given a variety of names. It appears, however, that in South Africa a single genus existed probably with two species. Of these, one is small, generalised and lightly built, and is termed *Australopithecus* or *A. africanus*, while the other is larger, more specialised and robust, and is termed *Paranthropus* or *A. robustus*. It is improbable that either of these South African forms constituted a major source of the later, more advanced hominids.

In the Lower Pleistocene Bed I in the Olduvai Gorge, Tanzania, a fossil rather similar to the more rugged Australopithecines of South Africa was found. *Zinjanthropus boisei*, as it was named, is now frequently referred to as *Australopithecus boisei*. Estimated to be some 1,700,000 years old, this creature was perhaps the earliest tool-maker, but it is likely that *Homo habilis*, a more advanced hominid contemporaneously existing at Olduvai, was the maker of the numerous Oldowan stone tools found in Bed I. Oldowan tools, widely distributed in Africa, represent the first tool-making tradition, and with this culture the Palaeolithic Age begins.

The survival of Australopithecinae on the ground depended on the fullest exploitation of characters incipiently present in the foregoing arboreal phase. Of such preadaptations the orthograde posture with occasional bipedal gait, the freeing of the forelimbs, the prehensibility and mobility of the hands are all especially characteristic of the higher primates. The structural changes in posture and locomotion, the exploitation of manipulative ability and visual acuity are only a part of a complex of behavioural adjustments. Survival depended greatly upon further development of the social cohesiveness and inter-communication so characteristic of the higher primates generally. It is certain that these terrestrial bipeds successfully adapted to the environmental circumstances of Pleistocene Africa largely as a result of social grouping and co-operation. Living in the savannah areas, only thus could such puny creatures lacking natural body defence mechanisms and not particularly fleet of foot, compete successfully with large carnivores and only in such groups could the acquired skills of one generation be efficiently transmitted to the next. The study of the behaviour patterns of the extant non-human primates, particularly those such as the chimpanzees and baboons who spend much of their time on the ground, does, by analogy shed light on aspects of the possible behaviour of the earliest hominids. Somewhat similar environmental hazards have been successfully overcome both by the Australopithecinae and by the living primates named. Moreover the social life of today's hunters and gatherers sheds light upon facets of the probable social activity of the earliest hominids having a similar subsistence economy. These last remnants today of the non-agricultural world provide us with the only direct information we can hope to obtain of the biology of hunter gatherer populations in the past exposed to the multiple hazards of the natural environment.

Homo erectus.

Remains are very widespread in the Old World and they represent the next major stage in the evolution of the Hominids. Most finds are dated to the Middle Pleistocene period. The brain is now much larger than in the Australopithecines, though smaller than in modern man. The skull bones are very thick and the skull exhibits massive bony ridges. There is neither a chin nor a forehead present. The first finds were made in Middle Pleistocene deposits in Java by Dr. E. Dubois. This creature, *Pithecanthropus erectus* (*Homo erectus javanensis*) was indisputably erect and walked on two legs. Dr. G. H. R. von Koenigswald discovered more specimens of the same general type in Java and he also found the remains of a Lower Pleistocene more rugged form which he named *P. robustus*. A massive jaw which he found—*Meganthropus palaeojavanicus*—probably

represents the Australopithecine stage in Java and has also been named *Paranthropus (Australopithecus) palaeojavanicus*.

In 1927 and 1929 the first remains of Pekin Man (*Sinanthropus pekinensis*; *Homo erectus pekinensis*) were found in Chou Kou Tien cave near Pekin. These remains were Middle Pleistocene contemporaries of Java Man whom they closely resembled.

Until certain finds were made in East Africa in the nineteen fifties and sixties, particularly at Olduvai, *Homo erectus* remains were only known from the Far East. It had been widely accepted that man originated in Asia and not in Africa, an interpretation that is little supported today. A skull found in the Middle Pleistocene Bed II at Olduvai, as well as certain mandibles found at Ternifine, Algeria, are also without doubt representatives of *Homo erectus*. The Ternifine (*Atlanthropus*) jaws as well as very similar mandibles found at Sidi Abderrahman, near Casablanca, Morocco, are accompanied by hand axes of the so-called Acheulean culture. The Olduvai *Homo erectus* skull dated at approximately 490,000 years was also associated with hand axes.

European fossil remains approximately contemporaneous with Pekin Man include the massive Mauer Jaw found without associated artifacts in 1907 near Heidelberg in Germany. In 1964 and 1965 equally ancient remains were found at Vértesszöllös, Hungary, and these are also of the *Homo erectus* type.

Prior to the Middle Pleistocene all the varieties of primates, including man, had been confined to the tropical parts of the world. Now, with cultural advances including knowledge of fire, man was able to leave the tropical areas and to utilise the space and the resources of the more northerly parts of the Old World. Both at Vértesszöllös (450,000 years B.P.; Mindel I–II Interstadial) and at Chou Kou Tien (approximately contemporary) there is clear evidence of the use of fire.

Absolute and Relative Dating.

In tracing the emergence of man it is desirable that the various finds should be dated as accurately as possible, both in relative terms and also, if possible, in absolute terms. Various methods have been devised and the results are often expressed by giving the date as so many years B.P. The initials B.P. stand for "before present" and the present conventionally means the year A.D. 1950.

The potassium-argon method, depending on the rate of radioactive decay of potassium to argon is useful for dating material from 230,000 to 26 million years old. For more recent finds up to about 50,000 years old, the Carbon-14 method is appropriate. Dating with this method depends on establishing the ratio of Carbon-14 (the radioactive isotope of Carbon) to Carbon-12—ordinary Carbon. One method of relative dating is called the fluorine method depending as it does on the fact that fossil bones contain fluorine in proportion to their antiquity. Relative dating may also be deduced from the depths at which fossil bones are found in undisturbed strata. Relative dating is also possible from the known sequence of glacial events during the Pleistocene. During this period much of northern Eurasia witnessed four major glacial advances, the so-called ice ages, Günz, Mindel, Riss, and Würm. Milder periods or Interglacials separated the Ice Ages and geological deposits of the glacial and interglacial periods, easily characterised by the remains of the distinctive flora and fauna which they contain, provide a framework for dating fossil man. Thus two human skulls from the second, Mindel–Riss Interglacial (130–180,000 B.P.) are known in Europe, those of Steinheim, Germany, and Swanscombe, Kent. The latter was associated with the Mid-Acheulean hand-axe culture. No artifacts were found with Steinheim man. The Steinheim cranium is much more complete than the Swanscombe remains and in size it approximates to modern man. Some of its morphological features are similar to modern man; others to Neanderthal man. Steinheim could in fact be a generalised ancestor for both these major human types. The Swanscombe bones are sometimes similarly interpreted though they have on occasion been classed as an early form of *Homo sapiens*, pre-dating the Neanderthalians.

Neanderthal Man.

Neanderthaloids are found in Upper Pleistocene times during the early part of the Würm glaciation, particularly in Europe, West and Central Asia, and North Africa. Early discoveries included those in the Neander valley in Germany, Gibraltar, Spy (Belgium), and Krapina (Jugoslavia). Subsequently many other finds were made including, for example, La Chapelle (France), Teshik-Tash (Uzbekistan) Haua Fteah (Cyrenaica), and Rabat (Morocco).

Early proto-Neanderthalers, such as Steinheim, were followed by the "classic" Neanderthal forms, conventionalised as of brutish appearance, with massive eyebrow ridges, sloping foreheads, long, large, crania and receding chins. The cave of Tabûn on Mt. Carmel, Israel, yielded remains of these "classic" forms, while the nearby Skhûl cave contained remains of men much more similar to those of today. The remains may represent variation normal within a group or else may indicate that the Neanderthalers interbred with people of modern type, thus producing the Skhûl hybrids.

Rhodesian Man, found in 1921, in Broken Hill, Zambia, is clearly neither a Neanderthaler nor a modern type of man. The skull was for long thought to be unique, if not highly aberrant. However, in 1951 a similar skull was found at Saldanha Bay in the Cape Province of South Africa. These are early Upper Pleistocene remains, approximately 40,000 years B.P. Solo Man, in Java, is a not altogether dissimilar and may be the direct descendant of *Homo erectus* in South East Asia. Both Rhodesian and Solo Man are sometimes regarded as variants of the basic Neanderthal type.

Homo Sapiens.

Homo sapiens emerged during the fourth, Würm, glaciation, a process precisely dated by the radiocarbon technique among others. Neanderthal Man seems to have been replaced by *Homo sapiens*, of completely modern appearance, certainly by some 30,000 years B.P.

Neanderthal Man's stone tools were made on flakes, and in Europe constituted the so-called Mousterian industry. Post-Neanderthal men were technically more advanced, their stone tools including small knife blades and engraving tools specialised for different purposes. This is the typical Upper Palaeolithic tool assemblage, of the Aurignacian, Solutrean and Magdalenian, and other tool-making cultures. It was during this Upper Palaeolithic period that man, though still everywhere a hunter and gatherer of foodstuffs, first showed artistic tendencies.

Combe Capelle in southern Central France yielded the earliest known skull (approximately 34,000 years B.P.) of completely modern type in western Eurasia and Africa. The Cromagnon people were somewhat later (20–30,000 years B.P.). Physically, the Cromagnon people were tall, with long heads, very large brain cases and short, broad faces. Approximately similar humans have been found elsewhere, as in the Upper Cave at Chou Kou Tien, and a skull from the Niah Cave in Sarawak dated at about 40,000 years B.P. is the earliest known representative of *Homo sapiens* in Asia. In Java, the descendants of Solo Man may well be the Wadjak people of about 10,000 years B.P. These are similar to the Australian Aborigines and they may be roughly contemporary with a skull from Kellor near Melbourne which indicates that Australia was populated in late Pleistocene or early post-Pleistocene times. Again in Upper Pleistocene Southern Africa there were people with very large brain cases and with features rather like the present-day Bushmen and Hottentots. The Boskop skull is of this type. No skeletons showing characteristic Negro features have been found in Africa before post-Pleistocene times. This suggests a late evolutionary emergence for the Negroes. The Americas were peopled by immigrants from North East Asia some 15–20,000 years ago, and subsequently. Some of the early groups of immigrants have been described as "Archaic White", as have the Ainu of Northern Japan, but it is more generally accepted that successive waves of Mongoloids moved into the Americas from Asia, the Eskimo being the last group to arrive.

Even today the total number of known fossil

human remains is small for the long time span of human evolution and it is very difficult if not impossible as yet to trace the precise ancestry of each of the races of man.

The Races of Man.

The species *Homo sapiens* to which all living men belong is differentiated into local variant populations which are interfertile and not always sharply distinguished from one another. Many attempts have been made to classify mankind into races, usually on the basis of readily visible external features such as head shape, stature, and skin colour. Such formal classifications express real features of human variation but in somewhat artificial if not misleading manner, since the impression is created that the species is naturally partitioned into discrete, discontinuous groups, whereas changes from one region to another are often gradual rather than abrupt transitions. Again all human groups are variable within themselves and populations frequently overlap considerably in quantitative characters, in which case, the distinction between them is best expressed in statistical terms as differences in average values. Discrete variables such as blood groups are usually found in most populations but with different frequencies of occurrence.

A race is best considered as a Mendelian population, that is, as a reproductive community of individuals who share in a common gene pool. Again a race has been defined as a group of people who have the majority of their physical attributes in common. It is manifestly improper to refer to religious or linguistic groupings as races since cultural attributes obviously vary quite independently of the physical features used in race definition.

Three types of Mendelian populations or races are sometimes distinguished: (1) Geographical, (2) Local and (3) Microgeographical or Micro-races.

(1) *Geographical Race.*

This is a collection of Mendelian populations such as occupy whole continents or large islands and separated by major barriers such as mountains and deserts. The Australian Aborigines and the African Negroes provide examples.

(2) *Local Races.*

These are sub-populations within the Geographical Races, frequently corresponding with distinct or isolated breeding populations. They are adapted to local environmental pressures and are maintained by social and physical barriers which prevent gene flow between them. Examples include the tribes within the Amerindian Geographical Race, the Basques, Ainu and Gypsies.

(3) *Micro-races.*

These are the numerous distinct populations which are not clearly bounded breeding populations and can be distinguished only statistically. Their existence is demonstrated by variations in the frequencies of genes within a densely populated country. Many of man's physical attributes, etc. vary from group to group and since these traits have a genetic component, then they also are characteristic of micro-races.

Anthropometry.

This constitutes a system of techniques for the measurement of the skeleton and of the body. From the early 19th cent. onwards anthropometry was an important means of giving quantitative expression to the variation in physical traits among human beings. In fact until fairly recently, anthropometry has been the mainstay of physical anthropology, preoccupied as it was with the problems of evolutionary descent. The measurement of the skeleton was stressed since skeletal remains constitute the most direct evidence of earlier populations. The shape of the living body and of the skeleton can precisely be expressed metrically, but it is usual to use relatively few measurements, and these normally represent the major features, including, for example, stature, shoulder width, head length, and head breadth. The latter two were especially favoured and the cephalic index was obtained by expressing the breadth as a percentage of the length. Long heads, with low cephalic indices (below 75) were termed dolichocephalic while round heads, with high indices (above 81) were termed brachycephalic.

Anthropometric features are known to vary widely among the world's populations. Thus while the Nilotes of the Sudan have an average stature of 1·78 m the African pygmies average 1·36 m. Dolichocephalic heads are prevalent among Australian Aborigines while brachycephaly is extremely prevalent among the Mongoloid peoples of Asia.

Anthropometric characteristics such as these are not immutable and it has been shown in studies in the United States, Hawaii, and elsewhere that immigrants' offspring rapidly develop bodily changes when compared with their parents or when compared with groups in their homelands. It is impossible to say whether the races of man are becoming more or less heterogeneous as a result of such processes.

Pigmentation.

Hair, skin, and eye colour were traditionally described either in subjective terms or else by reference to matching standards. Both procedures presented serious limitations in reliability and in comparability of results. Recent years have witnessed the use of much more satisfactory objective procedures, involving spectrophotometers in hair and skin colour studies. These instruments record the percentage of light of a number of known specified wavelengths reflected from a surface relative to the reflectance from a pure white surface. In general the darker the specimen, say of hair, the lower the percentage of light which it reflects. Using such instruments precise and reliable quantitative estimations of hair and skin colour are possible; the genetic basis of the traits may be clarified and comprehended and the selective advantages of skin and hair colour may be examined quantitatively. Dark skins confer advantages in hot, sunny areas since they protect the body against the harmful effects of ultraviolet radiation, minimising the incidence of skin cancer for example. Light skins are advantageous in cloudy areas with low insolation since they facilitate the body's synthesis of Vitamin D, thus reducing the incidence of rickets. The correlation between dark pigmentation and high levels of solar radiation is high, but it is impossible to state how much of the geographical distribution of skin colour mirrors the spread of dark- and light-skinned peoples from one or two sources and how much of the patterning is due to independent adaptations in many human groups in the past.

Physiometric Observations.

These cover a range of phenomena including handedness, the ability to taste phenylthiocarbamide (P.T.C.), colour-blindness, and fingerprints. The genetic basis for many of these attributes are well known. Thus red-green colour blindness is a sex-linked character, males being far more frequently affected than females. Within Britain percentages of colour-blind males range from 5·4 in N.E. Scotland to 9·5 in S.W. England. Non-European populations generally exhibit much lower frequencies.

The tasting of P.T.C. is controlled by two genes, T and t, the former being dominant. TT and Tt individuals normally experience a bitter taste sensation when they sip P.T.C. solutions; tt individuals either cannot taste the substance at all or else only in very strong concentrations. The tt individuals are termed Non-tasters; TT and Tt individuals are termed Tasters. High frequencies of Non-tasters (exceeding 38 per cent) occur in parts of Wales and in Orkney, while low values (approximately 24 per cent) occur in North Lancashire and Northumberland. A clue to the selective significance of this trait is provided by the excess of Non-tasters among individuals with nodular goitres (thyroid abnormalities). Non-European populations usually have lower percentages of Non-tasters than the British figures quoted. Thus, for example, the Jivaro Indians in the Amazonian lowlands of Ecuador contain but 1–2 per cent of Non-tasters as do the Chinese and many African Negro groups.

In recent years very much work has been done

on dermatoglyphic variability in humans. Dermatoglyphic studies are concerned with the epidermal ridges which form systems of lines on the surface of the stratum corneum of the palms of the hands, the fingers, the soles of the feet, and the toes. On the tips of the fingers three basic pattern types occur:

(1) The arch. The ridges or lines of the pattern show simple but marked curvature.
(2) The loop. The characteristic feature of a loop is that the direction of a parallel field of lines turns through two right angles (180°).
(3) The whorl. Two loops in close association or fused to form a circle make a pattern known as a whorl. When this is so, typically one or more ridge lines turn through an angle of 360°.

Similar configurational areas occur on the palms in the four inter-digital regions as well as in the thenar and hypothenar areas. The topographic description of the dermal ridge patterns may be supplemented by metrical observations and those in general use include counting the numbers of triradii, patterns of different types and ridges and measuring distances between specified points. A triradius may be defined as the junction of three regions each containing systems of ridges which are approximately parallel in small fields of these regions.

There is now plentiful evidence to indicate that these dermatoglyphic data are genetically determined and as such they denote important qualitative and quantitative differences among the races of man. Thus the total ridge counts and the complexity of the finger patterns, particularly whorls, are much greater among the Mongoloid peoples than among any other human races. Two useful descriptive devices are:

(1) Dankmeijer's arch/whorl Index (total frequency of arches/Total frequency of whorls × 100) and,
(2) Pattern Intensity Index (the average number of triradii occurring on fingers per individual).

The complexity of the patterns increases in the order arch, loop, whorl, and is accompanied by an increase in the number of triradii. Therefore a low value of the Index indicates a high frequency of arches and a high value a high frequency of whorls. In Europe there is a tendency for pattern intensity to increase from North to South while in Asia, Africa, and among the indigenous populations of the Americas, the reverse is on the whole true.

Attributes of the Blood.

1. *Blood Groups.*

Many blood group systems (*see* Index to Section P) are known today in addition to the ABO system which was the first discovered and which matters so much in blood transfusion. The mode of inheritance of the numerous blood-group substances is known. Blood grouping is relatively simple depending as it does on reactions between antigens on the red blood cells and specified antibodies derived from the blood serum.

The ABO system basically involves three genes, A, B, and O. Every individual inherits two of these genes from parents and so the genotype (genetic constitution) must be one of the following: AA, AO, BB, BO, AB, or OO. O is recessive to both A and B and thus there are four possible phenotypes (genetic constitutions detectable by blood grouping): A, B, AB, and O.

The ABO genes constitute a polymorphic system, that is several genes occur with frequencies such that the least frequent of them occurs with a frequency exceeding that due to mutation alone. Certain selective advantages and disadvantages of the ABO genes in human populations are known. Thus stomach cancers are more frequent among individuals of group A than they are in the population at large. Again, duodenal ulcers are almost 40 per cent more common among persons of blood group O than in individuals of the other ABO groups.

Both on a global and on a local scale, the ABO genes display marked racial variation. Within Britain A varies from 31 per cent to 53 per cent, increasing in frequency from North to South: O varies from 38–54 per cent, increasing in frequency from South to North. B shows less variation, though it is most prevalent in the Celtic areas. The regional fluctuations are not random but systematic and statistically highly significant despite the enormous migrations within Britain during the last few hundred years, which might well have masked or minimised the underlying variability.

Globally the ABO variation is also striking. Thus the percentage of the blood group B exceeds 30 among the Mongoloids of Central and East Asia but the B gene is virtually absent in the Australian Aborigines, the American Indians and in the Basques. Many Amerindian tribes are 100 per cent O; some others have very high A frequencies.

In the Rhesus blood group system all humans are either Rh+ (DD or Dd) or Rh− (dd) (*see* Index to Section P). All the Amerindians and Australian Aborigines, and most of the East Asians are Rh+. Rh− individuals are more frequent in western Asia, in parts of Africa and especially in north west Europe where the Rh− percentage is approximately 15. The Basques are distinctive in having a 40 per cent Rh− frequency. Racial variation is partly explained by selection via haemolytic disease of the newborn (*erythroblastosis foetalis*), whereby Rh+ offspring of Rh− women (possible if the father is Rh+) may die before birth owing to their Rh blood group incompatibility with their mother.

An examination of the occurrence of the M and N genes of the MNSs system shows that most populations have an M frequency of 0·5 to 0·6. However, a higher frequency is found among American Indians, Eskimos, some of the peoples of European Russia, and in populations in Southern Asia, while N is higher than M throughout the Pacific area. The S allele is very rare among the aboriginal people of Australia but it occurs at a frequency of some 20 per cent in the native population of New Guinea.

Again the Diego antigen is very rare among Europeans but moderately common in South American Indians and it is present in East Asians and in some North American Indians.

The P blood group antigen has a higher frequency among Negroes than in most other races. However, it also has a high frequency among certain Pacific Island peoples including the New Zealand Maori.

2. *Haemoglobins.*

Haemoglobin exists in alternative forms in man and these are genetically controlled. The frequencies of some of the genes which control haemoglobins vary markedly among human populations. The principal technique used to show variant haemoglobins is electrophoresis—the movement of charged particles in an electric field.

Normal human haemoglobin comprises two different haemoglobins (A and A2). An interesting variant is haemoglobin S. This may be indicated by electrophoresis and also by a sickling test. Red cells containing haemoglobin S placed in an oxygen-free atmosphere assume sickle shapes. Individuals who have inherited one S gene (AS heterozygotes) have a mild, non-fatal anaemia—the sickle cell trait. Homozygous SS individuals suffer from the severe sickle cell anaemia which is usually fatal before maturity. Some abnormal haemoglobins including S, E, and C have high frequencies and their existence, since all of them are deleterious to some extent, provides opportunities for viewing the action of natural selection and gene flow in human populations. Haemoglobin S reaches very high frequencies among some populations in southern Asia and particularly in much of tropical Africa (10–40 per cent), despite its severe effect on individual viability and fertility. Haemoglobin C is most prevalent in northern Ghana and contiguous areas while Haemoglobin E is found principally in South East Asia, with frequencies as high as 27 per cent in Cambodia.

Homozygous SS individuals hardly ever live to transmit the S gene and without a compensatory effect the gene would be totally lost except for

certain cases possibly occurring as mutations. Compensation is through positive selection in favour of AS individuals who are more resistant to and so protected from falciparum malaria. Again AS females might be more fertile than AA females in certain populations, and this again would help to maintain the high S frequencies.

3. *Other Serological Attributes.*

Other polymorphisms include the haptoglobins (proteins that bind the haemoglobin of old and broken-down red blood cells), serum transferrins (proteins in the blood sera used in transporting iron within the body) and the enzyme Glucose-6-phosphate Dehydrogenase (G6PD) and selective agencies are operative on these also.

Many populations have been surveyed for haptoglobins and the haptoglobin frequencies are usually reported as the incidence of the gene Hp^1. The lowest frequency reported for the Hp^1 allele is from a group of Irula tribesmen in southern India where Hp^1 is 0·07. The highest frequencies are found among populations in West and Central Africa, with the values falling both northwards and southwards in that continent, and high values also occur among Indians in South and Central America. The frequency of the Hp^1 gene increases more or less regularly from India northeastwards through Siberia and into North America and it also increases from India northwestwards across Northern and Western Europe. Another striking and seemingly regular increase occurs from North America southwards to the equatorial regions of South America.

These remarkable changes in the frequency of the Hp^1 allele both northwestwards and northeastwards from India and from the northern hemisphere to the equator is usually attributed to environmental selection. It is known that the capacity of haptoglobin to bind haemoglobin varies considerably among the types. The Hp. 1–1 type has considerably greater capacity than the others. It is possible that the relatively high incidence of haemolytic conditions, especially the anaemias, in tropical populations, is related to an advantage in the haemoglobin binding capacity which one haptoglobin type may have over others.

The distribution of the transferrin phenotypes has not been studied as extensively as that of the haptoglobins but populations from many parts of the world have been examined. The alleles which produce Tf. B are not widely distributed and are almost never found in Africa or the Pacific Islands. Tf. D has a much wider distribution and is most prevalent in New Guinea and Australia and also is found in various African tribes and in a number of American Indian groups. European populations and their descendants have a very low incidence of both Tf. B and Tf. D. The reasons for transferrin polymorphisms are unknown. It has however been suggested that the transferrin–iron complex, prevents the multiplication of viruses in the body. However, there is no evidence that resistance to viruses maintains the observed transferrin polymorphisms and neither diet, disease nor climate has been correlated with the distribution of the transferrin alleles.

Deficiency of the red cell enzyme G6PD occurs in two forms, an African form (B) and a Mediterranean form (A). Affected individuals may develop haemolytic anaemia when exposed to certain antimalaria substances, to some common drugs or even to the fava bean which has long been cultivated in the Middle East. The deficiency which is inherited as an X linked trait usually incompletely dominant appears to be an adaptation to malaria and, like the sickle cell polymorphism, illustrates a disability which, in certain circumstances, is advantageous. Moreover, it is an example of a disability which occurs among a fraction of mankind, a disability arising from a separate genetic heritage. G6PD is not found among Eskimos, Northern and Central Europeans, Australian Aborigines, or American Indians. However, the gene is very common in Africa, the Middle East, and parts of the Far East, all of which are malarial regions. Thus it may well be that the advantage which is conferred is high resistance to malaria and that this is the means whereby the polymorphism is maintained in many populations.

Other red cell enzymes are known, including Acid phosphatase. Three alleles are recognised—P^a, P^b and P^c. In Africa P^a has a low frequency and P^c tends to be totally absent. European populations have some 36 per cent of P^a and 7 per cent of P^c. Another red cell enzyme is termed 6-Phosphogluconate dehydrogenase. In this system the common allele is PGD^A. PGD^C frequencies vary systematically, European populations having frequencies of 2–3 per cent and higher values occurring in Asia and the Middle East. Adenylate kinase constitutes another red cell enzyme. The AK^1 gene is the commonest with AK^2 rare and virtually confined to European populations among which it has a frequency of some 5 per cent. Phosphoglucomutase represents another red cell enzyme. Only alleles at the PGM_1 locus need be considered since variants at the PGM_2 locus are exceedingly rare. The frequency of $PGM\text{-}^1$ varies from 70–90 per cent in virtually all populations to date examined, with a tendency to higher frequencies in Negroes than in Europeans.

The non-uniform distribution of blood group, haemoglobin, and other gene frequencies in the races of man may be explained in terms of natural selection, gene flow between populations, random genetic drift, the founder principle and the development of geographical and socio-cultural isolation. Gene mutation is a point change in the DNA code and it constitutes the most fundamental factor acting upon gene frequencies. The mutation rate, or the rate of this alteration in the basic chemical structure of the gene, is evidently the same in all human populations. Whether or not a new gene remains in the population after its initial appearance depends upon the action of other evolutionary agencies. Thus, for example, natural selection, which is any environmental force that promotes the reproduction of certain members of the population who carry certain genes, at the expense of all the other members. Natural selection favours those genes which place their possessors at a reproductive advantage and tend to eliminate those genes that place the individual at an initial or long-term disadvantage. An example as simple as the amount of melanin present in the skin is entirely appropriate. High melanin concentrations inhibit the natural production of vitamin D by irradiation and thus brings about vitamin D deficiency rickets and subsequent pelvic disproportions which may adversely interfere with pregnancy and a normal delivery.

Without doubt many of the characteristics used to identify groups of people or races have come into being through the forces of natural selection. A population whose members have shared the same gene pool for many generations and who are all descendants of a common ancestry has more than likely occupied the same geographical area and has thus responded to the same environment for a long period of time. If the environment has changed over the generations it may be assumed that natural selection has been at work, retaining some mutations, eliminating others and in any event changing the gene frequencies. Thus many genes now in the pool of a particular population were established through natural selection many generations ago. Unfavourable genes in an individual cannot be modified or corrected and it is unlikely, especially if their effects are major, that they will be transmitted to the next generation. Rather, carriers of these inbuilt genetic errors will have a lower probability of reproducing than those without them so that the next generation will have a higher proportion of individuals without the genetic defects and the generation following that an even higher proportion and so on. Population survival depending on genetic adaptation can only be effected through differential reproduction of genetically different individuals over the course of a number of generations.

The physical constitution of a population can also be influenced by gene flow which occurs when genes are transferred from one population to another. The carriers of these genes may arrive in great numbers and inundate the previously existing gene pool. On the other hand

the rate of genetic transfer may be slow but persistent over a protracted period. It is very unlikely that any human population ever remains genetically isolated over many generations despite geographical and/or socio-cultural factors. The islanders of Tristan da Cunha were relatively isolated by geographical distances; the Samaritans of Israel and a variety of religious groups in North America by social and cultural factors.

Unless mutation, natural selection, and gene flow are operating on a population, the gene frequencies within it will remain unchanged through successive generations, at least in large populations. In small populations on the other hand—the situation prevailing during most of man's evolution—the genetic state of affairs is quite different since the changes of gene frequencies may have nothing to do with selective advantages and disadvantages. In such populations the gene frequencies may oscillate due to random factors such as the greater fertility of one or two females or disasters killing many men from one kin group and the like. In this context it is necessary to refer to the effective size of a population, that is, the percentage of the total population actually carrying out reproduction In any human population many individuals are either too old or too young to be involved in reproduction and many who are of the appropriate biological and cultural age may not be reproducing. It has, for instance, been estimated that about 60 per cent of the population of the U.S.A. will reproduce the entire next generation.

As a principal agency only natural selection can account for the magnitude of the population differences and for the maintenance of the observed balanced genetic polymorphisms in man. Known frequency distributions suggest that there is some relationship between the environment and the incidence of, for example, the blood group genes. Both the variability and also the geographical gradients for the A and B genes are consistent with the hypothesis that these genes are influenced by environmental selection and it seems unlikely that such a phenomenal relationship is confined to the ABO system. Human populations or races are defined in terms of traits, only some of which have here been indicated, which are brought into being and maintained primarily by natural selection—by the incidence of disease, blood group incompatibilities, diseases of the new born, and by differential fertility.

THE STUDY OF SOCIAL ANTHROPOLOGY.

What the Subject is About.

Social anthropology is concerned with the way men live as members of ordered societies. It has been described as a branch of sociology, or as the sociology of the simpler peoples. Neither description is wholly correct. A social anthropologist seeks to identify the *structure* of the society he studies and the *processes* of social interaction within it. His method is direct contact—what has been called "participant observation." Therefore he must deal with a unit small enough to be manageable with this technique. Nation-states, such as sociologists commonly work among, are too large. Most social anthropologists have done their work in what we call "small-scale" societies; that is, peoples who lacked such media of communication as writing or money, let alone mechanical means of transport, until these were brought to them from Europe. A social anthropologist may choose to work in some section of a society that possesses those techniques—in the ancient countries of the East or in Europe or America. In that case he confines himself to a microcosm such as a village or a factory. When he is writing of societies alien to his own and that of most of his readers he is obliged to describe their *culture* as well as their social relationships, since without such a description his readers would not be able to picture, or even understand, the social rules that are his main subject of study; this would be superfluous for a sociologist taking modern machine society for granted. Culture has been called the raw material out of which the anthropologist makes his analysis of social structure. It is the sum total of standardised ways of behaving, of lore and technique, of belief and symbolism, characteristic of any given society.

The Notion of Roles.

All the world, as Shakespeare said, is a stage, and this is a key metaphor for social anthropologists. Every individual does indeed play many parts, not consecutively but all together; for every social relationship carries with it the expectation of society that the parties to it will behave in approved ways. Father and children, ruler and subject, buyer and seller, husband and wife; every one of these words is the name of a *role* to be played by the person it describes. The playing of roles involves the recognition of claims and obligations as well as appropriate modes of behaviour in personal contacts. All these rules are called *norms*; when they are concerned with rights and obligations they are *jural norms*. A social norm is what people think ought to happen; unlike a statistical norm, it may or may not be what happens in the majority of cases.

Kinship and Marriage.

In societies of simple technology most roles are *ascribed*; that is, the parts people will play in life are given them at birth by the fact of their parentage and of the group in which this makes them members. In other words, the most important principal of organisation is *kinship*. W. H. R. Rivers called this "the social recognition of biological ties." The ties in question can be called genealogical; they all derive from the recognition of common ancestry. Such ties may be fictitious, as when a child is adopted. But in the vast majority of cases the relationships that are recognised are actually biological.

No man can recognise for social purposes all the individuals with whom he has a common ancestor somewhere in the past, or even know of their existence; their number increases with every generation. In every society a selection is made, from the whole universe of genealogically related persons, of certain categories towards which an individual recognises specific obligations and on whom he can make specific claims. Such *corporate groups* of kin have a permanent existence; they recruit new members in each generation in accordance with recognised rules. Kin groups are concerned largely with the transmission of property, and for this and other purposes they recognise the common authority of a senior man; they are also religious groups, performing together rituals directed to their common ancestors.

The common patrimony of a kin group normally consists in land or livestock; in societies of more advanced technology it may be a boat, as in Hong Kong, or even, as in Japan, a family business. It may have non-material resources too, such as the right to supply chiefs or priests for the society as a whole; this may be put conversely as the right to hold political or religious office. Those who share a common patrimony have a common interest in preserving and increasing it. Wrongs done by their members to outsiders are compensated from their collective resources, and they have joint responsibility for seeking compensation if one of their own members is injured, particularly in the case of homicide.

Descent.

Kin groups may be recruited according to a number of principles. A principle widely followed in small-scale societies is that of *unilineal descent*; that is, group membership is derived from one parent only, either the father (*patrilineal* or *agnatic*) or the mother (*matrilineal*). Property is *administered* by men in either system, but in the matrilineal system it is *inherited* from the mother; hence its control passes from a man to the sons of his sisters. In a unilineal system every individual recognises kin linked to him through the parent from whom he does not trace his descent; this is the principle of *complementary filiation*. The complementary kin are *matrilateral* where the descent rule is patrilineal, *patrilateral* where it is matrilineal. A unilineal descent group is called a *lineage*.

Descent can also be traced *cognatically*; that is, all descendants of a common ancestral pair may be recognised as forming one *kindred*. In such a system there is no permanent group patrimony; people inherit a share of the property of both their parents, and this is often conferred upon them

when they marry, while their parents are still living. Or all the inhabitants of a village may share rights in its rice-fields or fishing ponds; a man chooses among what kin he will live, but he can have rights in one village only. In such a system there are no continuing groups defined by descent; the permanent group is territorial, consisting in the inhabitants of the village.

Marriage.

Kinship status is defined by legitimate birth, and this in its turn by legal marriage. There are always rules against marriage with specified categories of kin, though these are not necessarily near kin. Some societies consider that the ideal marriage is that between the children of a brother and a sister; if such marriages are repeated through the generations they create a permanent link between two lineages. Marriage between members of the same lineage is nearly always forbidden; this is expressed in the term *lineage exogamy*. The general effect of the prohibitions is to spread widely through a society the links created by marriage, links that impose an obligation of friendship on groups that without them would be mutually hostile.

In a matrilineal system women bear children for their own lineage; it is expected that they should be fathered by a man who has married their mother according to the approved procedure, but a child's lineage membership is not affected by the marriage of its mother. But in a patrilineal society wives must be brought from outside to bear children for the group. Associated with this fact is the payment of *bridewealth*, which used to be mistakenly interpreted as the purchase of wives. This payment is what fixes the status of a woman's children; all those she bears while the bridewealth is with her lineage are reckoned as the children of the man on whose behalf it was paid, even if he is dead and she is living with another partner. In a matrilineal society the making of gifts is part of the marriage procedure, but they are of slight economic value in comparison with bridewealth. The difference is correlated with the difference in what the husband acquires by the marriage; in both cases he gains the right to his wife's domestic services and sexual fidelity, but where bridewealth is paid he can also count her children as his descendants and call on their labour when he needs it.

In societies where most roles are ascribed by the fact of birth, marriage is the most important field in which there is freedom of choice. But the choice is commonly exercised not by the couple but by their lineage seniors, who are more concerned with alliances between lineages than with the personal feelings of the pair. *Polygyny*, or the simultaneous marriage of a man to more than one woman, is permitted in lineage-based societies; indeed it is the ideal, though only a minority of men attain it. One reason why it is valued is that it enables a man who has the resources necessary for successive bridewealth payments to build up a network of alliances.

Authority Systems.

Every society has some arrangements for the maintenance of order, in the sense that force may be used against those who infringe legitimate rights. In every society theft, adultery, and homicide are treated as offences. Where no individual has authority to punish these on behalf of the community, *self-help* is the approved course. Lineage membership is significant here; a man who is wronged will go with his kin to seek redress (for a theft or adultery) or vengeance (for the homicide of a kinsman). Vengeance can be bought off by the payment of compensation; but because the taking of life is a serious matter in the most turbulent of societies, there must also be a solemn reconciliation, with a sacrifice to the ancestral spirits, between the lineages of killer and victim. The recognition of an appropriate method of dealing with injuries has been described as "the rule of law" in its simplest form.

Within a lineage the senior man is expected to settle quarrels, and the ancestral spirits are believed to punish with sickness juniors who do not listen to him. When quarrels break out between members of different lineages, their elders may meet and seek a solution. Where there is no hereditary authority individuals may attain positions of leadership in virtue of their powers of mediation by persuasion.

In addition to the maintenance of rights, most societies require at some time arrangements for the organisation of collective activities. It is possible for there to be no ascribed role of organiser; in such a case leadership is a matter of competition. Competitive leadership in economic activities is characteristic particularly of the very small societies of New Guinea. What is needed here is not only powers of persuasion but resources to reward the participants. The very important principle, to be discussed later, that every gift ought at some time to be returned, is the basis of their position. A man who can put others in his debt can call upon their labour. It may take a long time to build up the necessary resources for acknowledged leadership, and leadership may be lost to a rival and is not necessarily passed to an heir.

Responsibility both for law and order and for collective activities may be shared on recognised principles among the whole adult male population. This is done where society is organised on the basis of *age*, a system widely found in east and west Africa. In such a system all adult men pass through a series of stages at each of which appropriate tasks are allotted to them. In its simplest form the division is made into "warriors" and "elders". This principle may be complicated in various ways, but the essence of it is that men in their prime are responsible for activities requiring physical strength, impetuosity, and courage, while their elders have the task of mediating in disputes, discussing public affairs, and performing sacrifices to the ancestors. Men in the warrior grade are the fighting force, and may also have the police functions of summoning disputants and witnesses before the elders, and seizing property from a man who has been adjudged to pay compensation and does not do so voluntarily. Sometimes specific public works are allotted to them, such as rounding up stray cattle or clearing weeds from paths or springs. It is also possible for community responsibilities to be shared in more complicated ways, as for example among the Yakö of Nigeria, where the adherents of particular religious cults are believed to call on the spirit which they worship to punish persons guilty of particular offences.

Where there are hereditary chiefs, both public works and the maintenance of law and order are the responsibility of the chief and his subordinate officials. Resources are accumulated for public purposes by the collection of tribute, and labour is obtained for public works by the recognition of the principle that persons in authority can claim the labour of those subject to them. Expectations are attached to the role of chief as to any other. Chiefs are expected to dispense justice fairly, to be generous to the poor, to reward loyalty, and to be successful in war, and they are reminded of these expectations in the course of the elaborate rituals performed at their accession. The prosperity of the whole land is commonly held to be bound up with the health of the chief and the favourable attitude towards him of supernatural beings. He may be obliged to obey all kinds of ritual restrictions to this end; for example it was believed of the ruler of Ruanda, in east Africa, that he must not bend his knee lest the country be conquered. Chiefs are either themselves responsible for the performance of ritual on behalf of the whole populace or must maintain priests to do this.

Social anthropologists have recently turned their attention to the process of competition for the commanding roles which any society offers. Some would claim to have discarded the idea of structure altogether in favour of that of process; yet the structure must be taken into account as the set of rules in accordance with which the game is played. There are societies where it is the rule that on the death of a chief his sons must fight for the succession, to test who is the strongest and has the largest following. There are others where the rule of succession may seem to be clear, and yet there can always be dispute as to who fits it best. Sometimes people pursue the struggle for power by accusing their rivals of witchcraft; sometimes by massing their followers behind them in a show of strength before which their adversaries retire; the first is the method of the Ndembu in western

Zambia, the second that of the Pathans in the Swat Valley in Pakistan. Such confrontations occur at moments of crisis, but the process of building up support is going on all the time. The study of these processes is among the most interesting new developments in social anthropology.

Economic Systems.

The typical methods of subsistence in societies of simple technology are food-gathering (hunting and collecting roots and berries), herding, and agriculture. The domestication of animals and plants came relatively late in man's history; without it there could have been no permanent settlement, no cities, no civilisation. But the life of those food-gatherers who still exist is not a hard one; they can get an adequate diet in a very short working week. The three modes of subsistence should not be thought of as forming a historical series; moreover, there are many varieties of each, depending on the nature of the environment and the techniques used.

We shall never know what brought about the "agricultural revolution" or why the greater number of our ancestors chose the harder, but more productive, life of cultivators. This may have been somehow made necessary by the pressure of population in certain areas. Nor shall we know when and how trade and exchange began. We can reject the argument of Adam Smith that people first provided themselves with enough to eat and then began to exchange the products of specialists for surplus food. Exchanges are made among and between peoples who suffer from periodic famines, and the objects which are most valued are not exchanged for food.

These exchanges are not conducted, however, through the medium of a currency which enables people to calculate the relative value of goods of different kinds, as does money in a commercial society. Certain goods can be exchanged only for certain others—in the highlands of New Guinea, for example, shells and the plumes of rare birds. This has led to much controversy on the question whether primitive peoples can be said to have money. Of course, if money is defined as a universal medium of exchange, they do not. But some modern anthropologists find that too strict a definition, and prefer to say that, whereas modern currencies are "general-purpose money," societies of simple technology have different kinds of "special-purpose money"—strings of shells, hoe-blades, iron bars and the like, which are used only in a limited range of transactions.

It is certainly true, however, that money of this kind cannot be made the means of very exact calculations of profit and loss. It is often assumed that where there is no such common medium of exchange people do not make any economic calculations, and dispose of their property in ways that are the reverse of business-like. The principal reason why this assumption is made is the great importance attached in societies of simple technology to the making of gifts. The essential difference between a gift and a commercial exchange is that no return is stipulated. In the commercial world goods are sold, services hired, at a price, and anyone who fails to pay has broken a contract and is liable to be punished. The obligation to return a gift is a moral one. Moreover, to compete in the giving of gifts seems at first sight the very opposite of competition in the acquisition of wealth. But in most societies people who have a surplus of wealth like to have a reputation for generosity; only in the affluent world of machine production people feel the need to have many more material possessions before they begin to think in terms of surplus.

The exchange of gifts plays a particularly large part in the societies of Melanesia, where men form partnerships for the express purpose of giving and receiving valuable objects, and earn prestige at least as much by giving as by receiving. This exchange of valuables, mostly shell ornaments, is so important that it has a name in the language of each society. The first such exchange system to be described by an anthropologist was the *kula* of the Trobriand Islands, observed by Malinowski. An important man had a partner in an island on either side of his own home; from one he received armbands and returned necklaces, from the other he received necklaces and returned armbands. These objects did not become part of a store of wealth for any man; nobody could hold one long before it was time to pass it on to his partner. To receive his gift a man sailed by canoe to his partner's home; he was there welcomed peaceably, and while he was making his formal visit the crew were bartering their goods on the shore with the local populace. Thus the *kula* partnership had the nature of a political alliance; it was a means of maintaining peaceful relations between populations which would otherwise have been hostile.

In the highland area of New Guinea identical objects are exchanged, so that the relative value of amounts given and received can be calculated. In some parts the ideal is that a return gift should be twice the original one. Naturally it is no small achievement to carry on a prolonged series of exchanges at such a rate. Very few men manage it, and those who do are the acknowledged leaders of their community. For each large gift he has made a man wears a little bamboo stick hung round his neck; thus his munificence is publicly proclaimed. A new partnership is initiated by making the minimum gift. Men make these partnerships with others not bound to them by kinship, notably with their relatives by marriage. Each partnership extends the range within which a man can count on friendly treatment. So widespread is the idea that gifts should be repaid, and services rewarded, after some delay, and at the discretion of the man making the return, that where the highland people have taken to growing coffee for sale, the large-scale planters do not pay wages but employ young men for planting who get their return by coming to them later for help in difficulties. Of course the young men would stop giving their work if they judged that the return was not adequate.

Gift-giving, then, is an investment, but not one that produces a direct material return. One anthropologist, R. F. Salisbury, has called it an investment in power. The second classic example of the uneconomic use of goods is the *potlatch* practised by the Kwakiutl and kindred tribes of the northwest coast of America. This was a public distribution of goods at which the recipients had to be given their gifts in strict order of rank. The giver earned prestige and power by the scale of his gifts, by his knowledge of the correct rank order, and by the famous deeds (*potlatches* and others) which he was able to claim as feats of himself and his ancestors. Rivals for precedence would assert their claim by vying with each other in the amounts they distributed. The Kwakiutl way of avenging an insult was what has been called the "rivalry gesture." The man who thought he had been insulted actually destroyed valuable property by throwing it on a fire, or into the sea, and his enemy had to match him in destruction or be humiliated.

Certainly this is not turning resources to material advantage. No more is the giving of a very expensive dinner-party in London or New York. But equally certainly, it is not done without calculation. In the affluent society people display their superior affluence because this demonstrates their prestige rating, just as in the *potlach*; and they keep on good terms, through the hospitality they offer, with people from whom they may later seek a return in professional dealings, rather as in the Melanesian gift-exchanges. In fact a substantial proportion of the incomes of people in European societies who are by no means affluent goes into the making of gifts—to parents, to kin, to friends, to persons who have helped one or given one hospitality; gifts which are given as a matter of moral obligation. The difference between the uses to which resources are put in societies of simple and of complex technology is one only of degree. The proportion that is devoted to securing non-material advantages is higher in the small-scale societies, and so is the proportion of gift-giving to commercial exchange. In gift-giving there is no bargaining, but there is a clear expectation of return. The initiation of new social relationships by the making of gifts is not by any means confined to New Guinea. Bride-wealth which legitimises children is the most widespread example. Pastoral peoples in East Africa also make gifts of stock to selected friends in dis-

tant parts. The friend on his home ground is a sponsor for his partner, and he is expected to make return gifts from time to time, and may be asked for a beast if his partner is in difficulties. One could think of such an arrangement as a type of insurance.

A small number of social anthropologists have specialised in the study of the economic systems of small-scale societies, and have asked whether the concepts devised for the analysis of monetary economies—such notions, for example, as capital and credit—can be applied to people who gain their livelihood directly from the resources of their immediate environment. Starting from the assumption that there is always some choice in the allocation of resources, they have observed how these choices are actually made in the societies where they have worked. They have asked how the value of such goods as are obtained by barter is measured; how labour is obtained, how directed and how rewarded for such enterprises as the building of a canoe or a temple, which call for the co-operation of large numbers. They have examined the use of media of exchange, asking how far any of these fulfil the functions that we associate with money.

The general conclusion of these studies is that peoples of simple technology are perfectly capable of rational calculation in the allocation of their resources, even though their calculations are rough by comparison with those of the entrepreneur in an industrial society. They know what to regard as an adequate return when they are bartering goods. They withhold goods from consumption when they are planning an enterprise; that is to say, a man who proposes to initiate such an activity as canoe-building arranges to be able to feed his labour force.

Religion.

At a time when people questioned whether "primitive" societies could be said to have religion, E. B. Tylor offered as a "minimum" definition of religion "the belief in spiritual beings." All societies of simple technology have such beliefs, and think that unseen personalised beings influence the course of nature by direct intervention, causing rain to fall if they are pleased with the actions of men and withholding it if they are angry, sending sickness as a punishment and so forth. In the great majority of such societies the most important spirits to be worshipped are those of dead ancestors. But there may also be a belief in gods responsible for particular aspects of the world, to whom offerings are made for protection or success in their special fields. Many preliterate peoples believe in a "high god" from whom all other spirits derive their power, and one school of anthropology sees this as evidence of an original state of higher religious consciousness from which man has declined; but this view is not widely held.

Rituals involving groups of people are commonly performed on occasions when changes of status are to be signalised. A child becomes a member of society not by being born, but at a naming or showing ceremony. A youth or girl becomes adult at initiation. Marriage, which makes a couple into potential parents and links their kin groups, is another such ritual.

In funerary rites the dead person is made into an ancestor, and his heir adopts his social personality and his responsibilities. The accession of a man to political office is surrounded by ritual, and chiefs frequently observe annual rites at the time of harvest, when it is the season, not the person, that is changing. These are *confirmatory* rituals, designed to keep society and the world on an even course. When something goes wrong, a drought or epidemic or an individual sickness, *piacular* rituals are performed to make peace with the spirits responsible for the disaster.

An essential aspect of many of these religions is the belief in witchcraft—that is that it is possible for humans to harm others merely by hating them. Witchcraft supplies an explanation of undeserved misfortune. Diviners employ a multitude of techniques (which anthropologists rather inaccurately call oracles) to detect whether a disaster is a merited punishment or is due to witchcraft.

Every small-scale society has its myths—stories which tell how the world as people know it came to be. Sometimes their ritual re-enacts the myth; often the myth tells how the ritual was first performed and thereby gives a reason for its continuance. Then there are myths telling how death and evil came into the world. Some myths lend authority to the existing social order, and particularly to the claims of ruling groups, by telling how the social structure was divinely ordained. Under the influence of the French anthropologist Lévi-Strauss, many anthropologists are beginning to see both myths and the symbolism of ritual as man's earliest attempt to order intellectually the world of his experience.

The existence of ultra-human beings on whom the affairs of men depended was universally taken for granted until a very short time ago. As long as this belief was held, the established order in any society was supported by the tenets of religion. But there are also revolutionary religions. In recent years anthropologists have been inspired by the many new religions that have arisen in developing territories to give more attention to this side of the subject. Notably in Melanesia, a succession of prophets have appeared with a message announcing the imminent coming of an ideal world from which all hardships would be banished, including the subjection of the indigenous peoples to colonial rulers. These events turned the attention of anthropologists, along with sociologists and historians, to the study of similar movements in the past, and we now have a considerable body of literature on such subjects as "the religions of the oppressed."

Closer study of traditional religions from this point of view has shown that they also often include symbolic reversals as part of their regular ritual. The high are brought low and the humble exalted. In his ritual installation a chief may be beaten and abused by his subjects, or a rite that confirms his authority may include a simulated rebellion. Women may assume for a day the garb and authority of men. There is a temporary suspension of the rules and cultural forms which differentiate the members of the ritual congregation. This may go as far as "ritual licence," in which actions that at other times are offences liable to punishment, notably sexual promiscuity, are permitted and must not be made a reason for quarrels. Or it may be simply that the participants are masked, stripped naked, or dressed identically. Such rituals affirm their common membership, or communitas, as it has been called, and where they express not merely unity and equality, but the reversal of high and low, they remind the powerful that they must not abuse their power. Rites of this kind form a phase in complex rituals. They are followed by a re-affirmation of the accepted order in its ideal form, where hierarchical relations maintain order without promoting injustice. This theory would interpret the new "subversive" religions as the response to situations in which the injustices of the powerful have gone too far for the re-assertion of communitas to be possible.

Social Change.

No doubt all the societies that anthropologists have studied have been gradually changing throughout the centuries when their history was not recorded. But they experienced nothing like the rapidity of the changes that came to them when they were brought under the rule of European nations and introduced to mass production and a money economy. The effect of this has been in essence to widen the range of choice in the relationships that people can form. A man may choose to be dependent on an employer rather than on work in co-operation with his kin or village mates. He is more likely to rise in the world by going to school and getting a city job than by earning the respect of the villagers or the approval of a chief. Small-scale societies are now becoming merged in larger ones, and the close ties of the isolated village are loosened. In the newly created industrial areas new specialised associations are formed to pursue professional and other interests. The social insurance that kinship provided is lacking, and it has not as yet been replaced by what the state offers in the highly industrialised societies. The minority that has

whole-heartedly adopted the values of the industrialised world now produces the political rulers of new states. They are impatient to carry the majority along the same road, but there are profound conflicts of value between them and the still largely illiterate masses.

The first studies of this type of social change were mainly interested in the effects of intrusive influences on traditional institutions in rural areas. Later, attention was turned to social relationships in the cities which have come into being, or greatly increased in size and population, as a result of the development of commerce and industry. Recent work is largely concerned with the extent to which immigrants to the cities preserve their sense of a distinctive home origin. Immigrant populations which have abandoned all their traditional customs often preserve a strong sense of a common identity which differentiates them from their neighbours, and sometimes they even create a myth of the possession of "special customs" that has no foundation in fact. This sense of a particularly close relationship between people from the same place of origin is called *ethnicity*. It has been argued that when the members of an *ethnic group* are in a privileged position they appeal to the sense of ethnicity to close the ranks against outsiders. The less fortunate might be more likely to unite on a non-ethnic basis to improve their position. Divisions based on ethnicity cut across those based on social class. This is a field in which the interests of social anthropologists and sociologists overlap. The conclusions drawn from studies in African cities could be, and no doubt will be, tested against work among immigrant populations in Europe and America.

PART VI. SPECIAL TOPICS

WORLD ENERGY RESOURCES

Until the last few years the subject of energy resources was thought to be of interest only to its own specialists. But growing concern by the informed public at the profligate use of many natural resources, particularly in the industrially advanced parts of the world, has directed attention to the problems of supply. A major concern is the heavy and growing dependence of the developed countries on oil, a large part of which comes from a politically unstable region. What turned this general feeling of unease into a situation demanding urgent action was the 1973 oil crisis following the Fourth Arab–Israeli War when prices were increased no less than fourfold and production cut (*see* **Middle East, Section C, Part I**), causing fuel shortages and balance-of-payments problems for the consuming countries. This situation led Britain to set up a Department of Energy to speed both the search for energy sources and the rate at which they could be brought into production, while the EEC set about formulating an energy policy with measures to limit consumption. Similarly, in the USA, President Nixon issued an Energy Message to Congress on what he called the "current emergency" with proposals for meeting the long-range goal of achieving self-sufficiency, and called a conference of the thirteen major oil-consuming countries of the world to examine the situation together. France proposed a full UN conference on energy.

1. Energy Requirements: The Growing Problem.

What was the background to this burgeoning of effort by the consuming countries to draw up coherent energy policies and achieve economies with special emphasis on cutting imports, notably of oil? Global energy requirements have been growing at an accelerating pace. In the inter-war years they rose at about 1½ per cent a year, but this rate itself increased to nearly 5 per cent in the decade beginning in 1950 and to 5½ per cent in the following one. In recent years the growth of demand specifically for oil has been at a rate of 7 per cent a year. Coal production has remained constant—declines in production in Western Europe, including the UK, being counterbalanced by increases in output in the USA and the USSR. The world market for energy is dominated by the USA where energy consumption is the highest in the world, roughly double that of other developed countries. Meanwhile two-thirds of the world's inhabitants, living in the developing countries, use so little per head that they consume only about one-tenth of global supplies.

Nuclear energy, hailed as the great hope early in the 1950s, has not as yet lived up to its initial promise. Though reactors have so far operated at high levels of safety, risks have been pinpointed in their normal working and in the associated operations of fuel transport, fuel processing, disposal of radioactive wastes, safe sealing of spent reactors, and even in the liability to exploitation militarily by guerrilla groups.

The UK was the first country to generate electricity from nuclear stations on an industrial scale (1956) but since then the nuclear power programme has faced delays and at present nuclear power only provides about 12 per cent of the country's electricity supplies. This topic is so important as to deserve a separate article (*see* **Nuclear Reactors**).

WORLD ENERGY CONSUMPTION AND POPULATION, BY MAJOR REGIONS, 1950, 1960, 1970

Region	1950		1960		1970	
	Population (million)	Consumption per capita (million Btu)	Population (million)	Consumption per capita (million Btu)	Population (million)	Consumption per capita (million Btu)
North America	166·1	221·9	198·7	245·1	226·2	329·3
Canada	13·7	197·6	17·9	217·0	21·4	328·9
United States	152·3	224·3	180·7	248·0	204·8	329·3
Western Europe	302·4	57·8	326·5	79·8	356·4	134·3
Oceania	12·2	73·0	15·4	90·8	19·2	127·7
Latin America	161·9	14·8	212·4	23·3	282·0	32·4
Asia (excl. Communist)	805·4	4·7	970·6	8·5	1,231·3	16·9
Japan	82·9	21·0	93·2	39·4	103·4	108·9
Other Asia	722·5	2·9	877·4	5·2	1,127·9	8·5
Africa	217·0	6·0	276·0	7·8	349·5	10·5
USSR and Comm. Eastern Europe	269·8	47·6	312·9	83·0	348·4	128·5
USSR	180·0	46·8	214·4	83·5	242·8	131·8
Eastern Europe	89·7	49·2	98·5	82·0	105·6	120·9
Communist Asia	569·8	2·2	677·5	9·7	795·6	14·2
WORLD	2,504·5	30·7	2,989·9	41·5	3,608·6	59·4

Of other possible sources only hydroelectricity (*see* L58) makes any appreciable contribution overall, though it may be of great local importance, while solar energy (*see* Energy Conversion, L37, Solar Batteries, L108) and geothermal energy (*see* L47) are applied only to a very limited extent.

Finally, the growing world dependence on oil and the forecasts of the trend accentuating in the future have led to a major shift in the relative commercial strengths of consuming countries and oil producers to the great advantage of the producers. These features are discussed in greater detail below.

The extraordinary change in price levels of oil over such a relatively short period has undermined the bases of earlier forecasting in many ways. It is therefore advisable to consider the situation in terms of the patterns of demand and the forecasts made in the period up to 1974, then the major changes in 1973/4 and the further trends developing from early 1974.

2. Patterns of Demand and Forecasts Made in Period up to 1974.

Reliability of Data.

Available data on world energy are now being carefully scrutinised, in view of the current public interest, and sometimes found wanting or inconsistent. An important warning was issued at a Royal Society meeting in 1973 called to discuss energy in the 1980s (its proceedings were due to be published in 1974); Mr. D. C. Ion of the World Energy 1974 Resources Survey drew attention to the fact that there is often insufficient knowledge to justify the apparent precision of original measurements of most energy resources. Collection of data is in many diverse hands and estimates are then amended by the opinions of those collecting them. Consequently in preparing for the survey recommended to the United Nations by the Stockholm Conference on the Environment 1972, definitions have been agreed; they are a compromise between different reserve concepts and tend to involve changes from earlier definitions. For example, for coal reserves, emphasis is now placed on what can be recovered under current operating and economic conditions, which vary from place to place and are influenced by local environmental interest—such as strong objections to a high sulphur coal which should therefore be excluded. A similar style of definition is to be used for oil reserves (" Quantities . . . remaining in the ground which . . . information indicates with reasonable certainty to be recovered based on the present state of technology and under existing economic conditions "). Without following the issue through in detail, practical definitions have similarly been laid down for natural gas (associated or not associated with oil), bituminous sands and oil shales, hydraulic energy, nuclear energy and renewable energy resources such as solar and tidal energy. Furthermore, the energy units vary with the mode of conversion; there is said to be a 30 : 1 difference for uranium used in a fast reactor or in a thermal reactor. Then, the smooth curve of say world oil production masks such varying features as changes in quality of original crudes and in quality of products demanded. For these and allied reasons, Mr. Ion concludes that past reserves figures need critical re-appraisal but also that even production figures are less firm than one would suspect and this in turn undermines the validity of the oft-cited reserves/production ratio.

Information is given below with the provisos implied by the above cautions.

UK Patterns.

The market for fuel is international. Consequently, though an individual country or a grouping—such as the EEC—may make its own appraisals and plans, these are influenced and may even be overwhelmed by world events. In the UK, for example, nearly all the oil is imported and this situation will continue until the oil from the North Sea starts to come ashore in appreciable quantities. For general perspective on the UK position the most recent authoritative survey on the energy scene is a report of the Institute of Fuel entitled *Energy for the Future* (1973). Overall patterns show the marked fall in coal usage that started before 1960 and was accompanied by an upsurge in, first, oil and then gas consumption. As proportions, coal's share of the market fell from 74 per cent to 47 per cent between 1960 and 1970, oil rose from 25 per cent to 45 per cent and natural gas contributed about 5 per cent by the end of that period. Progress in using nuclear power has been slow so that it contributed some 3 per cent of total energy demand in 1970 and hydroelectricity about 1 per cent. The total is given as 328·1 million tons coal equivalent (MTCE); note some data are given in oil equivalent (MTOE). Predictions were made before the crisis had developed during 1973, based on extrapolating overall energy usage at approximately 5 per cent per annum which in the recent past had proved reliable. Even at that time, however, there was considerable debate between various experts on the likely pattern for the future, the main area of difference being in the assessment of the relative contribution of coal.

The Institute of Fuel estimated reserves of coal as between 4 and 6×10^9 tons or about 30 years of output at the then current levels. A further 20×10^9 tons were considered as uneconomic at that time but of course could become of interest if fuel prices rose. National Coal Board sources on the other hand spoke of reserves capable of supporting increased demands at least until the middle of the next century. Further the NCB reported finding quite shallow reserves in thick seams in North Yorkshire during 1973 amounting to about 1,000 million tons, with indications of further finds from explorations in progress.

For oil and natural gas, reserves are probably less well established than those for coal; more important is the rate at which the fuel can be brought in. Both exploration and preparations for exploitation continue apace in the seas around Britain and information is constantly being reviewed and updated. Unfortunately, in respect of producing oil appalling weather in the North Sea and labour disputes are blamed for pushing

PRIMARY ENERGY INPUT AND FINAL ENERGY USE FOR 1970 AND ESTIMATES FOR 1980/1985

	Primary Input: Million tons oil equivalent						Final Use: 10^9 therms supplied

back the date for bringing the major fields " on real stream " from the end of 1974 to the end of 1975. A worldwide shortage of steel is a further handicap affecting the building of equipment for exploration and the off-shore platforms, pipelines and storages. However, Dr. J. Birks of BP considers that 3 million barrels a day (150 million tons a year) are likely to come from the UK sector of the North Sea by 1980. On this basis the UK should be self-sufficient by that time.

By mid-1974, according to plans of British Gas, some 10 million of their 13·5 million customers should have been converted to natural gas at generally twice the calorific value per unit volume of the previous town gas. Production is foreseen as rising to 80 MTOE in 1985 providing about 23 per cent of the total demand at that time. The industry appears confident about reserves and their confidence was reinforced by the successful completion of negotiations late in 1973 for purchasing all the natural gas from the Frigg field in the North Sea. Described as " the most significant event for the industry in the past few years " this alone was due to supply by 1978 about 30 per cent of the total then expected, assuring expansion into the 1980s apart from the probable further supplies from known sources in the North Sea.

Since progress with nuclear power has been slower than originally expected, the Institute of Fuel made only cautious forecasts suggesting 40 MTOE for 1985, 11 per cent of the total at the time.

The UK canvas is complicated not only by technical and economic considerations but also by a number of political ones, particularly the membership of the EEC. It is evident from publications of the EEC Commission that a contribution to their fuel needs is expected from the British off-shore fields, so that it cannot automatically be assumed that the reserves discovered in UK sectors will be used to fuel Britain. In addition, the oil companies may also find it logistically/commercially preferable to ship to European refineries rather than to Britain. Though both these factors introduce further elements of uncertainty into the picture, it seems reasonable to see Britain as having an energy surplus around 1980. The difficulties will be in the mid-decade.

World Patterns.

Though the USA leads the world in its share of energy utilisation, its proportion declined from 50 per cent in the mid-twenties, through 45 per cent in 1950 to under a third in 1970. The Soviet Union on the other hand rose from 2 per cent in 1925 to 15 per cent in 1970 and similar though smaller increases in share were shown by other communist countries, by Latin America, Africa and Asia. In Asia the position is dominated by the phenomenal growth of Japan which has increased at 10 per cent annually in energy demand on average in the post-war years. During the latter period, West Europe simply maintained its relative position at about 22 per cent.

Per head of population, North America (USA and Canada) used around 300 million Btu each year (in the SI system 1 Btu = 1·055 kJ), more than twice the figures for Western Europe, USSR and Oceania and almost 40 times those prevailing in Africa and the developing parts of Asia. At the 1973 Royal Society conference, Joel Darmstatter and Sam H. Schurr in a detailed review of the data and the shifts they indicated, quoted also the marked fall in the contribution of coal to the total energy supply, from 56 per cent in 1950 to 29 per cent in 1970. Over this period, oil rose in its share from 29 per cent to 46 per cent and gas from 9 per cent to 18 per cent. A noteworthy feature of the period is that the USA ceased to be self-sufficient in energy and has emerged as a third major importer alongside Europe and Japan. Movements of oil have grown so great that they have become the largest single item in international trade.

The consensus of opinion on probable trends for the future (before the major upset to the basic assumptions dealt with later) was for energy demand to continue growing world-wide at a rate between 5½ and 6 per cent with oil growing somewhat faster, for a sharply rising volume of oil imports into the USA (from 5 million barrels/day in 1972 to 13½ million in 1985) and for both West Europe and Japan to have their oil needs met preeminently by imports despite an expansion of oil-producing capacity in West Europe. The main exporting regions were seen as having these reserves in billion barrels (US billion = 10^9).

	billion barrels
Middle East; Saudi Arabia	183
Middle East; Other	172
North America	83
All other	81
Total	519

This indicates the dominating importance of the Middle East and particularly of Saudi Arabia before the crisis spurred on the new searches for resources. It must be emphasised that all these trends of consumption are greatly influenced by relationships of prices. Furthermore, the magnitudes of imports have been so great that in the winter of 1973/74 a dominating feature in the re-appraisals has been anxiety over probable damage to the whole economies of the oil-consuming countries inflicted by the rapid heavy price rises in oil when so many of the economies seemed to be heading for recession even before this further blow.

3. Major Economic Changes 1973/74.

As the demand for oil waxed stronger, the relative bargaining position of the oil producers grew even faster. On 1 January 1973 the price of Saudi Arabian light crude oil was $2·591 a barrel; by October it was up to $5·119 and was then increased by the oil-producing states to no less than $11·651 on 1 January 1974. Prices of other grades and from other countries rose correspondingly. Nigeria went up to $14·691. It was reported that in one auction buyers paid up to $17 a barrel for marginal supplies from Iran compared with a price of about $1·80 in 1971. Using the pretext of factors connected with the Arab-Israeli War of autumn 1973 the Arab producers announced cuts in production as an " oil weapon ", then some partial restoration of cuts (though many commentators considered the true reason was a desire to conserve the valuable but ultimately limited assets in the ground). Other countries, notably Iran and Iraq of the larger producers and also Nigeria, Angola, Gabon and Congo increased output as did Indonesia, Australia and Brunei. The Soviet Union raised output by about 8 per cent (30 million tons) between 1972 and 1973. Before this year of rapid change, the ratio of energy prices to others had shown only relatively small fluctuations over the period 1960 to 1973, according to the US Bureau of Labor Statistics but the ratio of petroleum prices to coal prices had fallen from roughly one to 0·55. The US First National City Bank attributed this to government action artificially depressing energy prices, although other interpretations were based on the normal working of the law of supply and demand. Whichever is the true reason, the observed fact is that in the industrialised countries in general, oil was transformed from an energy source well below the price of coal to one costing several times as much. It was little wonder that the 13-nation energy conference in February 1974 agreed that these prices presented the structure of world trade and finance with an unprecedented situation so that a comprehensive action programme was needed to deal with all facets of the world energy situation by co-operative measures.

4. Trends developing in Period from early 1974.

The reason for arranging this review in terms of date ranges can best be exemplified by some figures quoted in President Nixon's Energy Message. (For the UK the position was complicated by a coal industry dispute starting with a miners' ban on overtime and culminating in a strike in Feb 1974). In the USA, following an appeal for a major conservation effort, total consumption of gasoline was " nearly 9 per cent

below expectations" in December 1973; around the same time consumption was reduced compared with that in the previous year for home heating oil, in one survey by 16 per cent, for natural gas by 6 per cent and for electricity by 10 per cent. A major conservation programme was established and has cut consumption of energy by Federal Agencies by more than 20 per cent below anticipated demands. Each of these cases is a marked reversal of previous trends. Whether it proves to be sustained remains to be seen. But the combined effects of increases in prices, experience of shortages and patriotic appeals has been immediate throughout the industrialised countries; if it is sustained even at a diminished ebb it will have a major effect on all the trend forecasting hitherto carried out.

In all, measures taken can conveniently be grouped under the heads

A—a drive for economy ranging from such simple ideas as avoiding waste, to improving insulation of buildings, reducing losses in electricity transmission, examining other forms of energy transmission such as sending hydrogen rather than electricity, and thermal linkage schemes.

B—increased prospecting for sources of conventional fuels.

C—reconsidering sources of conventional fuels previously found uneconomic such as tar sands and oil shales.

D—reconsidering "fringe" sources previously thought uneconomic or of interest only in very limited situations such as solar energy, geothermal, tidal and wind sources.

Here it is possible to quote only a few "samples" of action taken under these various headings. In the UK new proposals were made for Building Regulations due to be introduced late 1974 tightening up the insulation of houses from allowing the passage of 1·4 watts/m^2, °C for roofs to allowing only 0·6—and for walls from 1·7 to 1·0. New "optimum start" devices were introduced for the heating of office blocks to eliminate waste of heat during times when they are unoccupied. A UK section has been established of the International Solar Energy Society, backed by the prestige of the Royal Institution and showing strong leanings to the objective of making practical use of this revenue source of energy on an economic basis. Among the linked energy schemes a striking proposal is that of a coal complex, named a Coalplex by the NCB, where coal provides the feedstock for a manufacturing complex producing clean gaseous and liquid fuels, chemicals, electric power and heat. Other schemes are limited to grouping electricity generation with heat recovery alone. The US budget includes research and development on geothermal energy and solar energy among its priorities. Its array of scientific, fiscal and administrative programmes are directed to the purpose of making the USA independent of foreign producers by 1980 despite a continuing increase in consumption. The UK Institute of Fuel, whose publication has been cited several times in this survey, felt the situation so grave that it went beyond a technical/economic survey and overcoming their repugnance at becoming politically involved went on to propose a fuel policy for the UK.

One other development, though designed to meet the needs of the developing countries, might become of interest to the industrialised countries because it involves no transmission costs. The severe impact of the raised fuel costs on developing countries has given added point to the efforts of the Intermediate Technology Development Group to render technical aid in a form which demands low capital investment, uses local sources and is suitable for dispersed use—reducing demands on transport or transmission systems. Current development projects include methane generators from animal and vegetable waste, with allied equipment to be driven by the gas such as a pistonless Humphrey pump, as well as solar heaters suited to this philosophy of design.

Conclusion

Overall, so many hares have been started by this major change in the world of energy supply, that much of the work done by forecasters in the past has become now largely of historic interest rather than a guide to policies and developments in the considerably modified future that is in the course of emerging. Yet the crisis provides such opportunities for rapid strides in fuel conservation and the search for new sources, particularly those without harmful environmental consequences, that after weathering the difficult years of the mid-decade we may decide that this twist in events has proved to have been a useful spur.

THE PRESENT STATUS OF NUCLEAR ENERGY

History.

Fission of the uranium nucleus, the physical process which introduced the era of nuclear energy, was demonstrated in the laboratory by Hahn and Strassman during 1938. The controlled release of energy resulting from the fission of uranium was first achieved in 1942 by Fermi and his associates in Chicago using an experimental assemblage of graphite and uranium. The first atomic bomb was exploded at Almagordo in 1945. From then until the mid-1950s many nuclear "piles" or reactors were constructed either as scientific tools, or as plants designed for quantity production of plutonium (Pu^{239}) from the non-fissile uranium isotope (U^{238}). This, the first of the truly man-made elements was produced primarily for use in nuclear weapons.

The first small-scale nuclear reactor designed primarily for the production of electrical power started in Russia in 1954. This was followed by the first large-scale Calder Hall reactor in mid-1956. In 1955 the first Geneva Conference of the United Nations on the Peaceful Uses of Atomic Energy was the occasion of a major release of information, previously classified.

The Suez crisis of 1956 accelerated and enlarged, in the United Kingdom, the first major programme of installation of nuclear power stations. It amounted to a modest 5000 megawatts of power. These stations now contribute about 12 per cent of the national electricity supply with a high availability which has proved very acceptable during successive fossil-fuel crises. Only recently has the cumulative power generated by these plants been surpassed by that of the rest of the world combined.

At present (1974) throughout the world approximately 280 nuclear power stations are either commissioned, being constructed or ordered. Their capital cost is about £150 per kilowatt (present-worth): investment in a typical 500 megawatt installation would therefore be about £75 million. Thus the past thirty-five years have seen a new science and technology grow from the laboratory scale to a fully fledged commercial operation on a world-wide basis involving capital investment at the level of many tens of thousands of million pounds. It has also demanded the massive investment in many countries of the highest quality science and technology. One consequence is that installation of nuclear power stations has been concentrated in the technologically advanced nations. Countries less well-developed in this sense have invariably "bought in" reactors and much of the associated technology as precursors essential to the development of a home-based capability. Departure from this pattern in the future is very unlikely.

Economics.

The first decade of nuclear power saw its development primarily towards military objectives under conditions of military security. The next fifteen years consisted of technical and scientific advances in development of civil nuclear power, of over optimism on the part of its proponents and of limited vision on the part of its opponents. The last decade has seen the acceptance of nuclear power as an economic source of power. Nuclear power stations cost appreciably more to construct per unit of power than their fossil-fuel fired counterparts but their operating costs are appreciably less. This capital-intensive property of nuclear power has meant that its economic viability has been much more dependent upon the interest rate of money than upon technical and

scientific advances and also that comparison of alternative types of nuclear reactors between countries has been confused by the existence of differing financial ground rules. Over the past five years world-wide escalation in the cost of first coal and then oil has meant that the operating cost of stations fired by these fuels has risen markedly; that for nuclear fuels has changed little, and in some cases has even fallen as a result of increasing quantity of production. Considerations of availability of fossil fuels apart, there is now general acceptance that nuclear power must form an increasing component of energy provision in the future.

Thermal Reactors.

Virtually all the nuclear power stations built to date have been thermal reactors. They are so called because the neutrons employed to cause fission in such reactors have relatively low energies—comparable with those that can be induced in atoms by thermal means. These thermal neutrons are produced by slowing down the very energetic fast neutrons which result from the fission process by passing them through "moderators". Some light atoms are particularly effective at slowing down neutrons without actually capturing them so that most moderating materials are either solid or liquid compounds of elements such as hydrogen H_2, deuterium D_2, beryllium Be, or carbon C, with one another or some other element which does not readily capture neutrons, such as oxygen. Light water (H_2O), heavy water (D_2O), graphite, beryllium, beryilla (BeO), organic compounds such as terphenyl, compounds of hydrogen with metals, *e.g.*, ZrH_2, have all been used with varying degrees of success as moderators in thermal reactors. The currently commercially successful thermal reactors are based on the first three moderators and they are usually classified according to the moderator they use.

Heavy Water Reactors.

Heavy water is a particularly efficient moderator, so much so that reactors using it can operate very effectively on uranium which contains no more of the fissile uranium isotope U^{235} than that which occurs in nature (~0·7 per cent). The Canadian CANDU reactor system is based on this combination of heavy-water moderator and natural uranium fuel in the form of uranium dioxide pellets sealed in zirconium alloy tubes. Heat generated by fission of the fuel is taken away by a heavy-water coolant which is passed through boilers where the heat is used to generate steam from ordinary water which drives the turbines which generate electricity. To improve the thermal efficiency of the system the temperature of the coolant has to be as high as possible; it is therefore pressurized to about 1200 pounds/sq in when its boiling-point is about 300° C. The coolant is separated from the moderator which is not pressurized, by pressure tubes which also contain the nuclear fuel. Nineteen reactors of this type have been commissioned or ordered, in Canada, Argentina, India, Pakistan and West Germany. An advanced variant of this reactor type is the Steam Generating Heavy Water Reactor (SGHWR) in which a light-water coolant pressurized to 1000 p.s.i. at 280° C is allowed to boil under controlled conditions generating steam which goes direct to the turbines. Because light water absorbs more neutrons than heavy water, the fuel has to be slightly enriched in U^{235}.

Light Water Reactors (LWR).

Ordinary light water is the basic source of heavy water from which it has to be separated. The latter is therefore appreciably more expensive than the former but against this has to be balanced the poorer moderating performance of light water which carries the penalty of requiring a fuel enriched in U^{235} to 2–4 per cent. In many countries the overall economic balance would appear to favour LWRs, for about 85 per cent of the nuclear power capacity operational, under construction or planned, is of this type.

The pressurized water reactor (PWR) version of the LWR was developed in the USA from the system used to power their nuclear submarines. The light water, used both as coolant and moderator is operated at ~320° C and 2000 p.s.i. pressure. A massive steel vessel ~9 in thick has thus to be used to contain the coolant and the fuel which consists of uranium dioxide pellets clad in zirconium alloy tubing. Heat is extracted from the coolant primary circuit by secondary circuits in which the steam needed to drive the turbines is generated.

In the boiling-water (BWR) version of the LWR, light water is again used both as moderator and coolant and the fuel is also very similar to that for PWRs. However in this system the coolant is allowed to boil in a controlled manner to generate steam which drives the turbines direct. The core is less compact than that of a PWR but as the coolant pressure is only 1000 p.s.i. (temperature ~290° C) a larger but thinner steel containment vessel is possible.

At present 173 PWRs and 100 BWRs are operational, under construction or ordered. Of late the safety of the PWR and to a lesser extent the BWR has been questioned in terms of the ability of the emergency systems so far incorporated in the reactors to deal with the situation resulting from a loss of coolant accident. Definitive answers will be available within the next few years.

Graphite Moderated Reactors.

Graphite is only a little inferior in performance to heavy water as a moderator. Its other physical properties are such as to offer the possibility of operating at high coolant temperatures without the need for excessive pressures which means that the thermal efficiency with which steam can be raised is greater than for water-moderated systems. The disadvantage of such an approach stems from the need to develop materials that will operate at these higher temperatures.

The natural uranium, graphite-moderated system was developed primarily in Britain and France. The coolant chosen was carbon dioxide because it was chemically compatible with graphite and because it had the good heat transport properties. The uranium metal fuel in the first commercial stations was clad in a magnesium alloy known as Magnox which gave its name to these stations in the UK. These fuel rods are placed in channels in the moderator through which carbon dioxide is circulated at 200–300 p.s.i. at ~390° C. The nuclear core which is large compared with LWRs was originally contained in larger but relatively thin steel pressure vessels; later versions used reinforced concrete containers to support a thin steel pressure vessel. The hot carbon dioxide is used in boilers to generate steam, at a slightly lower temperature, for feeding to the turbines.

The upper temperature limit of operation of the natural uranium reactors was set by the physical properties of the uranium metal and the Magnox cladding. To achieve higher coolant temperatures the nuclear fuel was changed to uranium dioxide as for the water-moderated systems, and the cladding to stainless steel. This latter change meant that fuel had to be enriched to 2–3 per cent U^{235} but the CO_2 gas pressure was raised to 600 p.s.i. and its temperature to about 630° C. These changes produced the British Advanced Gas-Cooled Reactor (AGR) eight of which are now being constructed or commissioned.

Another high temperature graphite-moderated reactor (HTR or HTGR) concept which developed at the same time as the AGR used helium as a coolant to overcome some of the chemical reactivity problems associated with CO_2 at higher temperatures. The use of helium also permitted the use of ceramic materials such as graphite and silicon carbide as cladding for the fuel which could be uranium carbide or uranium dioxide in the form of small spheres. These coated spheres are packed in cavities in the graphite moderator from which heat is extracted by helium at ~600 p.s.i. and ~750° C. Thus hot gas is used to generate steam for use in turbines at present but does offer the future possibility of driving gas turbines to generate electricity directly. Two types of fuel cycle are being contemplated for this reactor. The high enrichment cycle used in the

eight reactors ordered so far in the USA uses uranium carbide enriched to 80–90 per cent U^{235} mixed with thorium also as carbide. UK designs are based on the low enrichment uranium plutonium cycle using uranium dioxide particles enriched to 4–5 per cent U^{235} the remainder being U^{238} as in other thermal systems.

Efficiencies of conversion of thermal energy to electrical energy of ~42 per cent are obtained in the latest designs of AGR and HTR compared with ~33 per cent for water-cooled and moderated systems. The use of a solid moderator of considerable thermal capacity also considerably eased safety problems compared with water-based systems.

A variant of the lower temperature graphite-moderated system successfully introduced in the USSR uses light water as a coolant but with enriched uranium alloy fuel. In West Germany a version of the helium-cooled reactor using fuel incorporated into "pebbles" which move slowly as a bed through the core of a reactor has been demonstrated.

The HTR type of reactor holds interest for direct application of heat for coal gasification and steel-making as well as for electricity generation.

Enrichment.

All the thermal reactors discussed rely initially upon fission of U^{235} for production of energy. With the exception of the CANDU and Magnox reactors, all of them use fuel in which the ratio of the U^{235} to the U^{238} isotopes is greater than that found in naturally occurring uranium, *i.e.*, they are enriched in U^{235}. There are many processes whereby in principle this enrichment can be accomplished, relying upon minor but significant differences in the physical or physico-chemical property of the two isotopes. Selection of processes for development on a commercial scale has been largely on an economic basis. Until recent years the scene in the Western world was dominated by the diffusion process established on a large scale in the USA, and on a much smaller scale at Capenhurst in the UK and more recently at Pierrelatte in France. The basic principle used is a difference in mobility of the two isotopes, present as the gas uranium hexafluoride (UF_6), when forced to flow through very fine channels. Exploitation of this principle has involved the development of membranes which contain a sufficiency of these channels of the appropriate dimensions and of the plant and materials which could handle the chemically active uranium hexafluoride. More recently a great deal of interest has been shown in the use of high-speed gaseous centrifuges to separate the isotopes, the basic property involved being their small difference in mass. When the isotopic mixture, again as UF_6, is spun at a very high speed within a cylindrical centrifuge the two isotopes move from the centre towards the walls at differing speeds so that a difference in enrichment between wall and centre can be set up and exploited. The technology has again had to develop plant and materials capable of handling UF_6 but most of the innovation has however had to lie in developing the high-strength materials and bearings for the centrifuges which have to operate at very much higher speeds for longer times, reliably and in larger numbers than any such devices have hitherto. The incentive for this development has been purely economic, the centrifuge purportedly needing much less power and also being economically attractive on a much smaller scale than diffusion plants. The scale of enrichment processes is measured in separative work units (SWU); an economic size of diffusion plant is probably described in terms of thousands of tonnes of separative work per annum while that of a centrifuge plant could be an order of magnitudes less. Capital investment in the latter type of plant could be phased to meet the demand (ultimately on the 10,000 tonnes SWU scale for Europe) more economically than the former. Another method, the nozzle process again using UF_6, which relies upon difference in flow properties of the two isotopes near an orifice has also been intensively studied as a means of enrichment and shown to be practicable, but of marginal economic viability. There are many possible separation processes, and it is conceivable that a variant of any one of the basic techniques may prove a successful competitor to both the diffusion and gaseous centrifuge techniques.

Fuel Supplies.

Thermal reactors burn U^{235}, *i.e.*, the fuel rejected from the reactor contains less U^{235} than when it was charged. Due to reactions of neutrons with the U^{235} which is also present some plutonium isotopes will be produced: if thorium was present in the fuel then another fissile uranium isotope U^{233} will have been produced. The net balance of all these nuclear reactions will however be that, to a greater or lesser degree, fissile material will have been consumed. More thermal reactors must therefore mean an increased demand for U^{235}: the availability of natural uranium has thus to be considered.

In 1972 it was estimated that the demand for basic raw material, the uranium oxide U_3O_8 could conceivably reach over 200,000 tonnes/year by the end of the century. This has to be compared with a peak production, to date, of about 44,000 tonnes. Reserves known to be recoverable within reasonable cost limits were estimated in 1970 to be about a million tonnes with a similar amount recoverable at somewhat greater costs. Since then further massive deposits of high-grade ore have been discovered in Australia, but to counter-balance this, shortage of oil is bound to further increase the demand for nuclear power. There are still further sources of uranium in low-grade deposits available on a tremendous scale, expensive to recover, but technically possible at a higher price. The ultimate source, the oceans, have been estimated to contain 1000,000,000 tonnes of uranium; the cost of recovery from this source is generally considered to set the ceiling for the price of uranium. At this point it must be emphasized again that the cost of fuel is only about one-third of the cost of electricity per unit sent out from a nuclear power station, and that the cost of uranium in the fuel is only a fraction of this one-third. The cost of nuclear power is therefore far less sensitive to the cost of uranium, than the fossil-fuelled stations are to the cost of oil or coal.

Breeder Reactors.

Reference has already been made to the generation of fissile isotopes Pu^{239} and U^{233} from the "fertile" atoms U^{238} and Th^{232} respectively, the transmutation being known as "breeding". Clearly more efficient use could be made of natural uranium if its U^{238}-content could be used to breed Pu^{239}. Thermal reactors so far developed are not particularly efficient in this respect but conceptually it is possible to design a thermal reactor in which as much fissile material is bred as is used up, *i.e.*, the fuel is "self-sustaining". One high-temperature gas-cooled reactor was originally conceived so as to be self-sustaining but its neutron economy has not proved sufficiently good in practical designs to be able to operate this way. A major problem is that some of the products of the fission process are nuclear "poisons" not readily removed from the solid fuel other than by out-of-reactor chemical treatment. There is one class of thermal reactor in which the fuel is liquid and from which these poisons are more readily removed in situ, *viz.*, the molten-salt reactor. In principle it should be possible to build a thermal molten-salt reactor based upon the thorium U^{233} cycle which is a breeder, *i.e.*, produces more fissile material than it consumes. Designs of such a reactor are currently being assessed in the USA.

The approach to breeder reactors generally adopted has been to harness the fast-fission process, *i.e.*, use the very energetic fast neutrons which result from the fission process to initiate the nuclear chain reaction dispensing completely with moderators. Such fast neutrons can also be used very efficiently to transmute U^{238} to Pu^{239}. A common way of expressing the breeding efficiency of fast reactors is by the term "doubling-time" which is the number of years of reactor operation required to double the amount of fissile material originally put into it. Doubling times of about 30 years are possible with present designs of reactors: for more advanced designs doubling times of as little as 10 years have been forecast. As the U^{238} not converted into Pu^{239}

can be chemically separated and recycled, in principle all the U^{238} available could be used as fuel ultimately giving the prospect of almost limitless supplies of energy. Thus it is said that enough uranium has already been imported in the UK to meet our electricity needs for a century if used in fast-breeder reactors.

The technology of fast reactors is complex. Because of the nature of the fast-fission process the core of a fast reactor which contains the fuel is much more compact than that of a thermal system. In the most highly-rated thermal reactors one might expect to get about 30 megawatts per tonne of fuel whilst in a fast reactor more than ten times that rating is aimed for. This means that heat has to be removed from the nuclear fuel very efficiently so that an exceptionally good coolant has to be used. The class of coolant most widely favoured has been that of liquid metals: of those, sodium is currently the preferred choice. Small experimental reactors generating up to 50 MW(E) have been operating successfully for more than a decade, *e.g.*, the Dounreay fast reactor (UK) EBRII (USA) Rapsodie (France), BR60 (Russia). Prototype power reactors of about 300 MW(E) are operating at Shevchenko (Russia), Marcoule (France) and at Dounreay (UK). Civil power stations of about 1000 MW(E) are being planned in many countries. Designs differ in detail but in basic principles they are all very similar. The fuel presently being used consists of mixed dioxides of uranium and plutonium (~20 per cent) contained in stainless steel tubes. The fissile core is completely surrounded by a "blanket" of fertile material which may be uranium dioxide, or uranium monocarbide in stainless steel cans. Through this assembly liquid sodium is circulated at high velocity, entering at about 400° C and leaving at about 650° C. Heat is transferred from this primary sodium coolant to sodium in a secondary circuit through intermediate heat-exchangers. The secondary sodium is then used to generate in a further circuit steam which is used to drive the turbines for electricity generation. The technical problems that have had to be overcome with the liquid metal fast breeder reactors have been formidable as can be judged from the time-scales involved. The first civil thermal stations in the UK became operational about 15 years after the first experimental reactor was built: the first experimental fast reactor is now about 15 years old and construction of the first civil power station has not yet started.

Alternative coolants such as high pressure gases have attractions and systems based on fused salts are also feasible but have received only minor attention so far.

Environmental Considerations.

The previous sections have described the prospect of almost limitless supplies of energy, but an environmental price will have to be paid. Most of the products of the fission process are of necessity radioactive isotopes; they could be gaseous, like krypton, xenon and tritium or solid like strontium, caesium, zirconium and ruthenium. There are also present the new radioactive elements plutonium, curium, actinium, etc. Further, in both the nuclear reactor and in the plant which is used to chemically treat and reprocess the nuclear fuel, radioactivity will be induced in associated structural materials, to varying degrees. In this latter case, unlike the former, the radioactive waste with which one is left can to a great extent be selected and is largely overshadowed in importance by the wastes arising from the fission and breeding processes.

Even if the whole of the UK electrical power was produced by nuclear means, the volumes of such wastes would be relatively small and need in principle tens of acres of storage area. Much of the activity would decay in a decade, a great deal more in a century, but that associated with the elements bred from uranium, would be present for thousands of years: Pu^{239} has a half-life of 25,000 years. Segregation of the various types of activity is feasible; their incorporation into physically and chemically stable form has received a great deal of study so that storage, readily monitored even for many generations, seems entirely possible. The radioactive properties of these wastes can only be changed by nuclear reactions. Bombardment with neutrons or other highly energetic particles can bring about such reactions so that forms of "nuclear incineration" are feasible but are not yet fully explored.

The price to pay for the availability of almost limitless energy from nuclear fission would therefore seem to be that of utmost care in the design and operation of nuclear plant and continual vigilance in the stewardship of nuclear wastes. The nuclear fusion process appears to offer greater degrees of freedom—but not complete freedom—in this respect, but probably not before the end of the century.

LINEAR ELECTRIC MOTORS

1. Elementary Principles.

By the time electrical machines were invented, effectively by Faraday's discoveries of 1831, the wheel was already well established as a more convenient device than those which could produce motion in a straight line, so it was natural that electric motors should first be made in a form which would produce rotary motion directly. Even so, by 1845, the first linear electric motor was suggested, indeed patented by Wheatstone, yet although he demonstrated its practicability by making a working model (now in the Science Museum, London) no one really saw a future for this type of motor until after the turn of the century.

FIG. 1.—The concept of a linear motor as the splitting and unrolling of a conventional rotary machine.

The concept of a linear motor is simple. It is perhaps most easily explained by imagining a rotary motor to have been cut along a radial plane and unrolled as shown in Fig. 1. The *ring* of coils, which in the rotary motor produced a *rotating* field, has become a *row* of coils producing a *travelling* field.

Naturally there are as many different types of linear motor as there are of rotary, for the splitting and unrolling process can be carried out on each type. However, just as the rotary induction motor dominates in rotary machines (to the extent of supplying over 95 per cent of the total *power* of electric drives throughout the world) so the linear induction motor has dominated the scene, certainly from its revival in the 1950s to the present time—and for the same reason.

In an induction motor a polyphase supply of electric current is used to set up a magnetic field which appears to move. If electrically-conducting material (usually copper or aluminium) is placed in such a field it is found to be, as it were, *dragged along* by the field. Although such a field is entirely fictitious, *i.e.*, does not consist of chemical elements, it appears to act exactly as would a viscous fluid and the engineer uses this analogy to help him design induction machines. The physicist, on the other hand, prefers to explain

the effect in terms of an induced e.m.f. in the secondary metal which is placed in the field, and although he cannot explain why such an event should occur, certain it is that electric currents flow in the metal, even though it is not connected to the supply, either electrically, or even, in some cases, mechanically.

This feature gives the induction motor its popularity, for with no brushes or rubbing contacts needed to feed current to the moving part, the latter can be very robust, consisting sometimes of no more than a solid piece of metal. The usual form of this *secondary* conductor in rotary motors is a "cage" of copper bars let into slots in a laminated cylindrical core and all joined together at each end of the cage with a thick conducting ring. In modern manufacture the whole of the cage is cast as a single operation.

2. A Century between Invention and Exploitation.

The main reason why linear motors did not succeed commercially in Victorian times, or in the first half of the 20th cent. is due to several causes.

First, there have been "fashions" in engineering in much the same way as there are fashions in clothing. Some properties of electric motors, considered *vital* in the 1920s, were almost neglected entirely by the 1960s, so rapid has been the change in opinion as to what is desirable. In Victorian times the constraints on a machine designer were relatively few. He was to produce a motor to drive a pump, or a fan and apart from the customer specifying the speed and the horsepower, the question of size or cost hardly entered into the design considerations. In the early part of the 20th cent. industry was becoming science-conscious and the word "efficiency" was being used as the overall standard of *quality*. Power factor (a technical index of the power consumed by a machine running on a.c.) was also becoming fashionable as transmission lines were being erected, for their efficiency in turn was seen to deteriorate as the power factor of the load was reduced. Efficiency and power factor were the "fashionable" quantities of the 1900–30 period. The induction motor was seen to have an inherently low power factor (especially in small sizes) and speed control could only be obtained with almost proportionate loss in efficiency, *i.e.*, a reduction in speed of 50 per cent meant a working efficiency at the lower speed of about half its full speed efficiency and therefore less than 50 per cent.

Such considerations led to great ingenuity among machine designers, and commutator motors (both a.c. and d.c. types) were developed to give higher values of efficiency and power factor, culminating in the Schräge motor which could give continuously adjustable speed over a wide range at unity power factor and virtually constant efficiency. Its only limitation was that its maximum power output was limited to perhaps 1000 hp but this obstacle, too, was overcome by even further ingenuity by Schwarz who invented what came to be known as the "N–S commutator motor".

Now all commutator machines are complex in structure by comparison with the induction motor, requiring insulated windings in both stationary and moving members. Such machines were therefore not readily acceptable in linear form for the reason illustrated in Fig. 2. The linear "cage-type" motor shown at (a) is an exact linear reproduction of a cage rotor machine and it is obvious that as soon as the motor begins to produce useful motion the two parts begin to separate so that the "active" part of the machine (AA^1 in Fig. 2) reduces rapidly to zero. For any kind of extended motion therefore, it is necessary to elongate either the primary or the secondary of the machine as shown in Fig.3 giving rise to the two classes of machine stated in the caption. Since the primary consists of insulated windings fed with current from the supply, while the secondary may be a solid casting which only carries current, by the very nature of the device, when in the active zone, extension of the secondary is obviously more economical than that of the primary. (Most commercial machines of the 1970s are "short-primary" motors.)

This then, is the second reason why linear motors were not popular, for even though extension of the secondary member does not imply that the primary need be made the *stationary* member to erect miles of laminated steel with slots containing copper bars

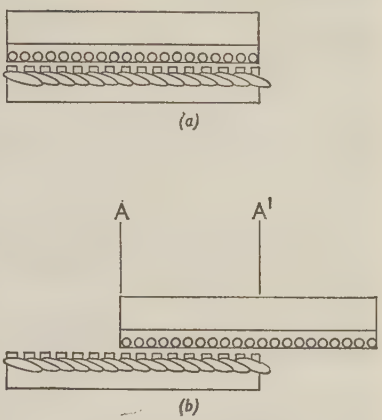

FIG. 2.—Primary and secondary members of equal length as in (a) are not acceptable where large movements are involved, as shown in (b).

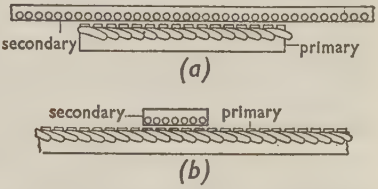

FIG. 3.—The two classes of linear motor resulting from the elongation of one of the members.
(a) Short primary machine
(b) Short secondary machine

joined by end bars for extended motion such as would be required for a transport system, for example, would involve very great cost. A moving primary involves additional penalty of having to feed the moving part with polyphase current through brushes and slip tracks and even after Zebden's invention of the "sheet rotor" or "double-sided sandwich motor" in 1903, no commercial enterprise was prepared to invest in it.

The reason for this is perhaps the third reason why the development of linear motors lagged so far behind that of their rotary ancestors for there had grown up in the years of development of the commutator machines a need to "explain" the action in simpler terms than those of the physicist, for the benefit of young men who wanted to enter the electric motor design business. Men like Heyland, Ferraris and Behrend introduced concepts such as the "circle diagram", the "rotating magnetic field" and the electric "equivalent circuit" and with the repeated teaching of these easy concepts to subsequent generations certain other "conventions" entered which were less true, among them being the belief that only motors with small airgaps between primary and secondary member could have high efficiency and power factor. This, when coupled with the fashion of the time, put Zehden's machine "out of court" for over half a century and a short examination of the sheet-rotor motor illustrates the inherent necessity for a larger airgap than those used even today, in rotating induction machines.

3. The "Double-sided Sandwich Motor".

Materials vary in their power to concentrate magnetic effects within themselves. Some—called ferromagnetic (*see* F19)—have this property to a marked degree and this is expressed by saying that they are highly permeable to magnetic flux.

The technical idea of *magnetic flux* can be visualised as lines of magnetic force threading their way through matter with a marked preference for concentrating in the high permeability materials such as iron and steel. Engineers frequently speak of the path followed by magnetic flux lines as a *magnetic circuit* in analogy to the electrical circuit followed by electric currents through good conductors such as copper and aluminium. The design of electrical machines is to a large extent a matter of ingeniously arranging the electric and magnetic circuits to achieve the desired end in the best way.

A remarkable example is in Fig. 4 which illustrates the various stages in development from a linear "cage" secondary in (a) to the elimination of slots by placing the "ladder" of conductor in the airgap itself, as in (b). This single topological step produces the following dramatic changes in the basic properties of the induction type of machine.

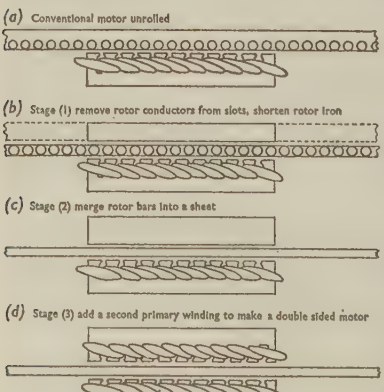
(1) The tractive force is now imparted to the conductor *directly*, not to the sides of the slots as was the case in (a). There is now no necessity to fit the whole length of secondary with laminated steel. A short block of the same length as the primary can be carried along *with* the primary, for its only purpose is to complete the magnetic circuit in highly permeable material. The result is a vast saving in secondary material.

(2) There is, in addition to the tangential electromagnetic force between primary and secondary of a machine, a purely magnetic force of attraction between primary and secondary iron parts. (This is comparable to a compressive stress, whilst the useful induction force is like a shearing stress.) In rotary motors, the magnetic pull is largely balanced out all round the machine by its cylindrical symmetry. Only manufacturing shortcomings which cause departure from such symmetry lead to an "unbalanced magnetic pull" (UMP). Yet so large is this effect that UMP gives cause for concern even among rotary motor designers.

The thought of the whole of the magnetic pull existing between primary and secondary in a linear motor could be said to constitute the fourth reason for doubts about the usefulness of linear machines, yet Zehden's development eliminates this pull, for the secondary iron is now separate from the secondary conductor and can be treated as a part of the primary, moving with it, and so can easily be designed to resist such a pull using fixed struts.

(3) With all the conductor in the airgap there is no need for the elaborate "grid" or "ladder" construction and the secondary can consist of a solid sheet of conductor as in Fig. 4 (c). (Much use of this type is made in modern machines).

(4) The second iron part, now being a part of the primary, can be fitted with a second winding as shown in (d) to give double the output for a given current loading.



(a) Conventional motor unrolled
(b) Stage (1) remove rotor conductors from slots, shorten rotor iron
(c) Stage (2) merge rotor bars into a sheet
(d) Stage (3) add a second primary winding to make a double sided motor

FIG. 4.—Stages in the development of the double-sided sandwich motor.

4. Penalties Introduced by the Splitting and Unrolling Process.

The modifications (1) to (4) introduced by the sheet-rotor technique did not however affect certain disadvantages of linear machines. Transient currents in the secondary plate induced as the front and back edges of the primary core passed over any given point gave rise to additional wasteful heating effects not present in rotary machines. It is possible to design in such a way as to minimise or even eliminate these losses, but again only within restricted limits because it is difficult to remove these particular heat losses without incurring others of a different origin and of a magnitude which in a rotary motor would present a totally unmanageable cooling requirement. However, there is no corresponding cooling problem at all in most linear machine designs, especially those designed for high speed, for the secondary metal may be hundreds of miles long and therefore a virtually infinite "heat sink". Looked at another way, any part of the secondary plate spends but a fraction of a second under the primary and it can readily stand high heat inputs for short durations.

A second disadvantage of the splitting and unrolling process which is less easy to eliminate by good design can be seen to arise when the disposition of the magnetic flux through the iron core of a rotary machine is compared with that in the linear version. A careful analysis of this shows that a depth of iron core is required in the linear machine which is in some places double that in the equivalent rotary machine. This is particularly expensive in the case of single-sided motors where the whole of the track core must be designed with the extra thickness of iron in mind.

5. Practical Machines.

The first full-scale, high-speed linear motor was built in 1946 for assisting aircraft on take-off (the Westinghouse "Electropult"). The design made no use of Zehden's techniques but used bars-in-slots, and single-sided construction.

By the 1960s however, linear motors were well established commercially for many purposes, including the motion of sliding doors, travelling cranes, lifts, conveyors, parcel sorters and a car crash-testing facility built at Nuneaton, England, the first large-scale sandwich motor to be built (in 1966). In some of the applications, such as travelling cranes, it was found possible to make a single-sided motor operate directly on to a steel girder, using the electrical conducting properties of the steel as well as its high permeability. The magnetic pull was used to advantage by mounting the linear motor beneath the girder so that the upward pull assisted the carriage in supporting the load. In other applications a secondary consisting of a sheet of aluminium backed by a solid sheet of steel was found to provide the necessary characteristics for the smallest capital outlay. Some useful working figures for the abilities of linear motors for low-speed or standstill application are that for continuously-rated motors with forced cooling it is possible to obtain thrust of the order of 1·0 N/cm^2 for a power dissipation of the order of 6 watts/Newton. Short-term rated motors are, of course capable of perhaps 20 N/cm^2.

But the application involving the greatest outlay of capital and probably holding the greatest prospects for large-scale industrial use remained that of propelling high speed ground transport systems.

6. High Speed Transport.

During the period 1960–65 it was recognised that several nations were actively engaged in studying such possibilities. In France, W. Germany, the USA, Japan, Britain and the USSR either government or industry was financing large programmes of research. A leaflet issued in Japan and printed in English declared that there were three aspects of high speed transport which might require separate solution:

(1) Supporting the weight of the vehicle and its load.

(2) Guiding the vehicle laterally along a predetermined track.

(3) Propelling the vehicle.

For some years the different groups in the various countries went their different ways in all three aspects, except that it emerged fairly quickly that if (1) could be solved, (2) could probably be solved by the same method. From 1965–70 there was an increasing swing towards linear motor propulsion and finally all but the "Aerotrain" team in France under M. Bertin had agreed on linear motors for item (3).

The various methods adopted for items (1) and (2) during this period can be principally grouped under the following headings, although there has been considerable confusion of nomenclature, both (c) and (d) being loosely named "Maglev":

(a) Permanent magnets in the vehicle repelling permanent magnets in the track.

(b) Air cushion suspension either of the pressure type ("Hovercraft") or the Vacuum type.

(c) Electromagnets on the vehicle operating into steel strips on the track (from the underside) with a sensing device to determine at what clearance the magnets shall run, this device controlling a solid state amplifier which in turn feeds the electromagnets—an automatic control system which can be stabilised.

(d) Electromagnetic repulsion due to the movement of a very powerful, d.c.-fed electromagnet using super-conducting cryogenic coils [*see* L28] on the vehicle which operate on a sheet of aluminium on the track. For speeds in excess of 40 mile/h the magnet induces sufficient current into the conducting track sheet that "lift off" is obtained. Stability in roll and lateral guidance is then achieved by duplicating the system on vertical plates on either side, the track conductor then being of "U"-channel shape. Alternatively, a "null-flux" method, self-stabilising in roll, involving track-mounted coils rather than a continuous sheet was developed in the USA by Powell and Danby.

In Britain a Government-sponsored company, Tracked Hovercraft Ltd. was set up in 1967 to build an experimental vehicle, supported and guided by air cushions and linear-motor propelled. The target speed, as in most other countries was 250 mile/h (≈400 km/h). A most important design criterion emerged almost simultaneously from the British, French and USA researches. The speed of a travelling magnetic field, like that of any other wave motion, is given by the product of wavelength and frequency. In induction terminology it is more usual to write $v_s = 2pf$ where p is the pole pitch (*i.e.*, the repeat distance of magnet poles along the line of the motor), and f is the supply frequency. If the desired synchronous speed, v_s, is 280 mile/h (to allow for some slip at full speed), the pole pitch required for a 50 Hz supply is over 4 ft (~ 1·3m). This imposes severe penalties on both electric and magnetic circuits. Indeed the design problems presented by such large pole pitches could not be solved without incurring serious economic consequences such as the large bulk of iron necessary to accommodate the magnetic flux.

Such considerations convinced all the experimenters throughout the world, at least for a time, that the use of a higher supply frequency was the only solution for high speed linear motors. An American report put the case concisely by declaring that the "correct" supply frequency was "one cycle per second per mile per hour", *i.e.*, you want 250 mile/h?—you must supply at 250 Hz and the pole pitch is thereby fixed at about 10 inches. When the cost and weight of frequency convertors using solid state devices was calculated however, the weight was found to be of the order of 16 tons for a 4 MVA convertor. This was accepted in certain groups as a possible solution, but in 1969, the research teams at Imperial College London and Tracked Hovercraft Ltd., working together, found a topological solution to the magnetic circuit which did not require frequency change. Called "transverse-flux motors" their principle effectively amounts to splitting the "conventional" linear motor up its centre longitudinally and re-arranging the polarity, as shown in Fig.5. This allows the core depth to be reduced to that necessary to transport the flux in a tooth A of one half to its neighbouring tooth B in the other half—and a whole tooth pitch t in which to do it. A core depth of no more than 1·5 inches may now be needed for twin 6 inches wide primaries with tooth width equal to ½ tooth pitch. Further reduction of core depth, however, is also possible for the novel design opens up a new possibility for exploiting the magnetic properties of the iron core by which the core depth is now reduced to a fraction of an inch. The importance of this invention is seen at once in that the track steel can be constructed of solid steel plate and the cost per mile greatly reduced compared with that required for a conventional (now called "longitudinal flux") motor which, even with frequency conversion, must be about 3 inches thick and laminated (*because* of the higher frequency). Motor primary weight is also considerably reduced.

It soon emerged in the 1970s that the concept of transverse flux did not constitute simply the invention of a new motor, so much as a whole new method of designing linear motors. Soon it was found that the subjects of lift and guidance could be combined so that they were provided by a single coil arrangement in a method of levitation so far not disclosed in the methods (a) to (d) described earlier. With these latest technical developments the possibilities of the linear motor are being excitingly enlarged.

LIQUID CRYSTALS

A Fourth State of Matter.

One of the most firmly entrenched fallacies of elementary science is that there are three, and

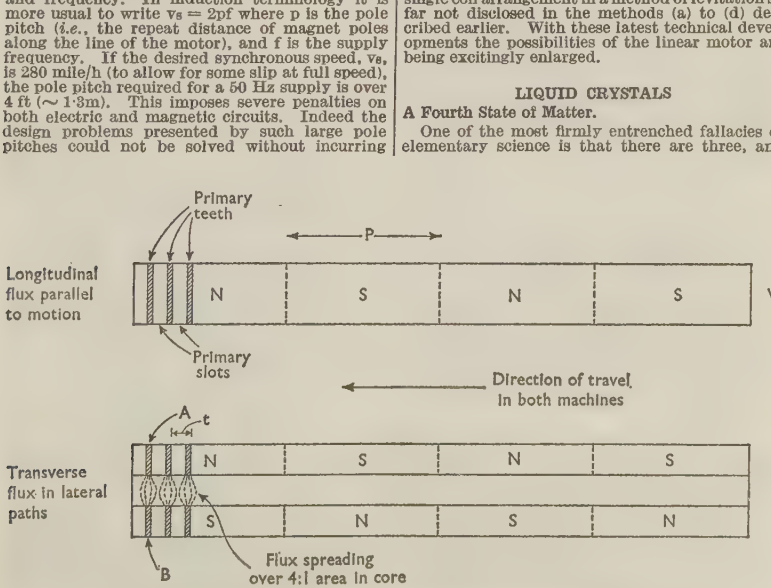


FIG. 5.—The principle of the transverse flux motor.

only three, states of matter: solid, liquid and gas. The fallacy was first exposed in 1888 by a German chemist, Reinitzer, who reported that cholesteryl benzoate melts in two stages. Below 145·5° C it is a normal crystalline solid and is therefore *anisotropic*, *i.e.*, its physical properties such as refractive index or electrical conductivity are different in different directions. Above 178·5° C it is a normal liquid and is therefore completely *isotropic*. But in between these two temperatures it is neither solid nor liquid, for it retains much of the anisotropy that is characteristic of the first state and yet has the capacity to *flow* that is so characteristic of the second.

Another German chemist, Lehmann, reported similar behaviour for two more organic compounds in 1890, and it was he who first introduced the term *liquid crystal* to describe the intermediate state. During the first half of the 20th cent. organic chemists synthesised many new liquid crystals, and when it became apparent round about 1970 that such substances might be put to use commercially, in various display devices, there was a fresh surge of effort in this direction. Hundreds of organic compounds which deserve to be classified as liquid crystals over some range of temperature have now been identified.

Optical studies with the aid of polarizing microscopes (especially the work published by the French physicist Friedel in 1922) and subsequent analysis by X-ray diffraction techniques have shown that there are several different types of liquid crystal, distinguished by their structure. A single substance may change from one type to another as the temperature is raised, and melting may therefore occur in more than two stages. Cases are known where there are as many as six distinct transitions separating the solid from the isotropic liquid, each of them quite as abrupt as the single melting transition that is observed when more familiar substances like ice are heated.

Different Types of Order.

On a sub-microscopic scale, the thing that distinguishes a solid from the corresponding liquid is the degree of *order* that prevails in the arrangement of the molecules. For an ideally simple substance whose molecules are spheres the order is purely *positional*: in the solid state the molecules are positioned on a regular lattice (Fig.1(a)), while in the liquid state they are stacked together more or less at random (Fig.1(b)). (*See* **F17, 18**). The substances of interest here, however, are all composed of rather complex molecules which are clearly not spherical, and these may be characterised by several distinct types of order, some of them *rotational* rather than positional. Consider, for example, the solid lattice illustrated schematically in Fig.1(c). There are five types of order apparent here, of which the first three can be classed as positional and the last two as rotational.

(i) The molecules lie in equally spaced layers.

(ii) Within each layer they are arranged on a regular two-dimensional lattice.

(iii) Each layer is related in a regular fashion to the one immediately above it.

(iv) The molecules, which are rod-shaped, are neatly aligned along a common axis.

(v) The molecules are all pointing along this axis in the same direction; black dots are used in this figure to distinguish the "head" of each molecule from its "tail", and it may be seen that no molecule is upside-down.

It is hard to imagine any half-way house between the order of Fig.1(a) and the disorder of Fig.1(b), so for the ideally simple substance it is to be expected that melting should involve a single abrupt transition. But the five types of order that distinguish the lattice in Fig.1(c) from the corresponding isotropic liquid structure shown in Fig.1(d) are nearly all independent of one another. They *may* disappear at the same temperature, but there is no reason in principle why they should not disappear one by one instead.

It is hard enough to calculate the melting

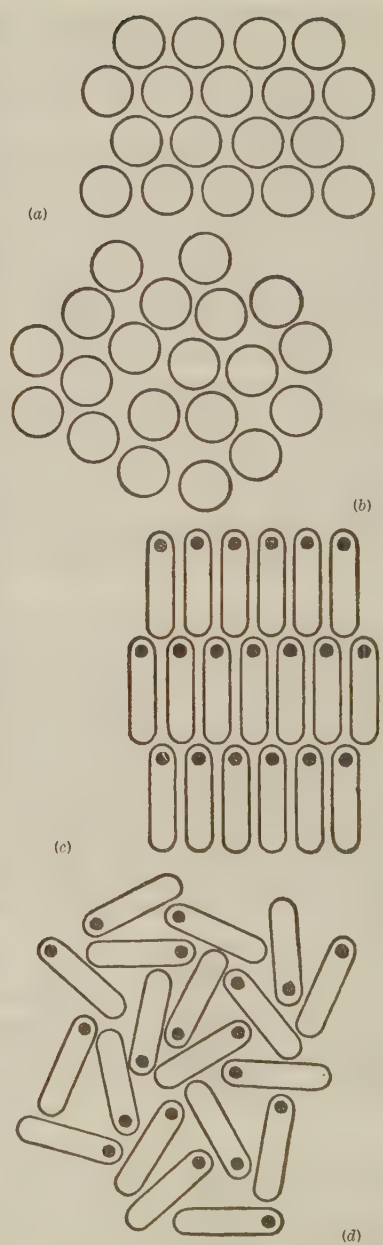

FIG. 1.—An attempt to represent in two dimensions some typical structures for (a) a simple solid, (b) the corresponding simple liquid, (c) a solid composed of asymmetric molecules, (d) the isotropic liquid corresponding to (c). Liquid crystals are intermediate between (c) and (d).

temperature of simple substances, and to predict from first principles just what will happen when a substance as complex as cholesteryl benzoate is heated is quite beyond our powers. The chemist who is searching for new liquid crystals must therefore rely upon intelligent guesswork, based upon experience.

Nematic and Smectic Liquid Crystals.

Experience suggests that most liquid crystals have molecules whose length to breadth ratio is at least 5, but which are not so long (like the long chain molecules of many polymers (*see* F24)) that they bend easily in the middle. The classic examples (*e.g.*, the compound p-methoxy-benzilidine, p-n-butyl aniline, or MBBA for short, the molecular formula of which is shown in Fig. 2) mostly consist of two benzene rings (*see* F24) joined by a rather rigid link, with subsidiary groups of atoms attached to each of the benzene

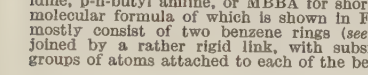

FIG. 2.—The MBBA molecule.

rings to provide a " head " and a " tail ". If the length to breadth ratio is much less than 5, then the substance is likely to lose its rotational order before its positional order; a temperature will be reached, as the solid is heated, at which the molecules start to spin freely and above which they may be found pointing in any direction, though they are still arranged on a regular lattice. The intermediate state or states shown by such a substance are classed as *plastic solid* rather than liquid crystal, because so long as a three-dimensional lattice persists there is always some rigidity. (The term *plastic* implies that the rigidity is not very great; once the molecules are spinning freely it does not take much of a push to make one layer of molecules slide over the next and to set going a process closely akin to liquid flow.) For a liquid-crystal state to appear, some aspect of the positional order must be the first to go.

The behaviour of MBBA is relatively simple, for it displays only one intermediate state; this is stable at room temperature, which is why MBBA is one of the liquid crystals likely to be of use commercially. It possesses some degree of rotational order, though the molecular alignment is no longer perfect, as we shall see below, but none of the types of positional order listed as (i)–(iii) above. Liquid crystals with structures of this type are classed as *nematic*; the name means " threaded " and the reason why it is appropriate will appear later.

The electrons in the MBBA molecule are distributed in such a way that each atom within it is more or less neutral. Experience suggests that when there is a transverse electric moment in the molecule (*see* F21), with positive charge concentrated on one side and negative charge on the other, more complicated behaviour is to be expected. The molecules are then reluctant to abandon the layer structure which enables the positive charge on one molecule to come close to the negative charge on the next. One or more layered or *smectic* liquid crystal intermediate states may then be observed; the name in this case means " soap-like " and is appropriate because in some very strong soap solutions the molecules are also arranged in layers, as we shall see below. Thus we may find on heating the solid that there comes a stage when the type of order listed as (iii) above suddenly disappears; the layers begin to slide freely over one another, which at once enables the substance to flow like a liquid, though its viscosity may be high by normal standards. It is then in a *smectic B* state. At a somewhat higher temperature the type of order listed as (ii) may disappear, *i.e.*, the two-dimensional lattice within each layer may break up, which makes the layers more flexible and reduces the viscosity. It is then in a *smectic A* state. At a higher temperature still the type of order listed as (i) may disappear; *i.e.*, the layers themselves may dissolve and the viscosity fall to a value comparable with that of water. If there is still some alignment left the substance is now nematic, like MBBA, and yet more heating will be needed before the isotropic liquid state is reached.

Other varieties of smectic state besides A and B are possible in which the molecules are tilted at some characteristic angle to the layer axis, but the labelling of these is still a matter for dispute.

The Structure of Nematics.

Nematic liquid crystals appear to be of greater technical importance than smectics, so let us consider in rather more detail what is known about their structure. To begin with, how complete is the molecular alignment in the nematic state? An analogy with a group of guardsmen fainting on parade may be helpful here. Picture a quarter of the molecules as being still " at attention ", as in the solid state, a quarter of them as being prone upon the ground and the remainder as leaning dangerously, and you will not be far wrong. The simile may suggest to the reader that the number of molecules left at attention is liable to diminish as the temperature is raised, and that corresponds to what is observed in practice. It cannot be stretched, however, to describe the abrupt drop in rotational order that occurs at the so-called *clear point*, T_c, where the substance at last becomes isotropic. The simile is faulty in one other respect beside: no nematic has yet been discovered in which the type of rotational order listed above as (v) is preserved, so half of the molecules standing at attention should really be pictured as standing on their heads!

For the theoretical physicist it is a challenge to provide an explanation for facts like these, and there are two directions in which an explanation has been sought. Every physicist would agree that the observed structure must be a compromise between two opposing influences, between the urge exhibited by all inanimate bodies to reach a state of low potential energy and the randomising effect of molecular agitation; some agitation of the molecules is inevitable, needless to say, and the higher the temperature the more violent it becomes. The question at issue is why alignment lowers the potential energy. According to one school of thought the important considerations here are geometrical; rod-shaped molecules can be stacked together more tightly once they are aligned, and the closer they get to one another, so it is argued, the lower their potential energy becomes. According to the other school the shape of the molecules is not of primary importance; what matters is a rather subtle term in the attractive interaction between two molecules which tends to make them align—much as two compass needles would—even if they are not in contact. The truth seems to lie between these two extremes.

What determines the direction of alignment? In the case of a thin film of nematic between two glass slides, say, it is normally the condition of the glass that counts. If the surface of the glass has been rubbed to and fro on a piece of paper the axis of alignment tends to lie in the plane of the film and to point along the rubbing direction. If great care is taken over the rubbing it is possible in this way to obtain films which are almost completely uniform throughout. Similar results can be achieved with less trouble and more reproducibly by coating the glass by evaporation at a grazing angle of incidence with an inert substance such as silicon monoxide. Treatment of the glass with chemical cleaning agents such as chromic acid, however, favours alignment perpendicular to the surface.

The slightest disturbance of a nematic film invariably breaks it up into a lot of smaller " single crystals " (*see* F18) and introduces a host of more or less mobile *disinclination lines* into its structure. These are regions where the direction of alignment abruptly changes. Because the refractive index of the nematic is anisotropic, they show up clearly under a polarizing microscope and constitute the " threads " after which the nematic state is named. In any bulk specimen of nematic material there is normally a network of disinclination lines, but even if these are absent,

thermal agitation by itself is sufficient to make the direction of alignment vary from place to place, enough to cause quite strong scattering of light. On this account nematic liquids look milky in the bottle. The sudden clearing that is seen when they are heated to T_c is a striking phenomenon.

The alignment of a nematic may be affected by the application of an electric field. In some cases the most stable configuration is such that the axis of alignment and the field are parallel; in others (MBBA included) it is such that the two are perpendicular. These facts are relevant to the operation of the display devices discussed below.

Liquid Crystals in Display Devices.

One of the ways in which liquid crystals are being put to use is to display figures in the small desk calculators which are so fashionable nowadays. Most of the calculators on the market at the time of writing still use display units of a different type, which contain either glowing filaments or light-emitting diodes, but liquid crystal display units are gaining ground. They suffer from the disadvantage that their switching time is relatively long; when the calculator is turned off it takes an appreciable fraction of a second for the display panel to clear. As against that, however, they are cheap to produce and the amount of power needed to operate them is very much less than for rival devices. The power requirement is important in these days of miniaturisation, when so many gadgets are expected to work off batteries. Liquid crystal displays make possible the design of a watch which will run for a whole year off a single tiny battery and be no more than a minute fast or slow by the end of it. Inside the watch would be a quartz crystal oscillator rather than the conventional moving escapement, and the time would appear on the face in digits, there being no moving hands. Such watches are in fact already available —at a price. By 1976 they will probably be commonplace.

Applications for liquid crystal display devices on a larger scale can also be envisaged. They could be used in advertisements, for example. They could be used in glass doors and arranged to switch on automatically, for safety purposes, whenever anyone approached. They could be used to make net curtains redundant in the home. They could conceivably be used to replace conventional television sets by something much less bulky. The many possibilities have scarcely been explored.

The common denominator in most of the liquid crystal display devices which are in production or on the drawing board at present is a thin nematic film between transparent plates, which have been coated on their inner surfaces with a transparent substance which conducts electricity, such as tin oxide. By connecting the two conducting layers to a voltage source an electric field can be applied perpendicular to the film, and it is this that switches on the device. Normally the coating will have been etched away in places to make sure that it is only certain limited areas of the panel which respond. To be able to display digits, for example, one needs to leave a set of seven patches of the tin oxide coating, arranged as in Fig. 3. The figure suggests how by connecting the voltage to these patches in different combinations one may cause any of the digits 0–9 to appear.

The devices already on the market are what are known as *dynamic scattering* devices. The effect of the electric field in these is to set the nematic liquid crystal into motion, whereupon it becomes cloudy. The cloudy regions are easily visible if there is a dark background to the display and some illumination from in front. The brighter the illumination the more clearly they stand out, whereas light-emitting diodes are not easy to see in strong sunlight. An attempt is made below to explain in simple language the reason why the field induces motion in these devices, and an alternative *static* device is then described.

Dynamic Scattering.

The instability of a film of something like MBBA subjected to a transverse electric field may be thought of as arising with the chance accumulation in some part of the film of a small amount of electric charge. The field acts upon this and drags the fluid into motion, whereupon the molecules that comprise the fluid become subject to two competing effects. On the one hand the electric field stabilises their alignment in the plane of the film (see above); on the other hand the shear component of the motion tends to tilt them out of this plane. If the latter effect wins, then because the electrical conductivity of MBBA is anisotropic the small electric current that is induced by the field no longer flows straight across the film; it acquires a component in the plane of the film. This reinforces the electric charge which we assume to be present in the first place, and it therefore causes the motion to build up. Detailed examination suggests that the process will not get going until a certain critical field is exceeded, and that the flow pattern then established will consist of a regular succession of strips (known as Williams domains) about as wide as the film is thick, within which the nematic is continuously rolling—clockwise in one domain and anti-clockwise in the next. These predictions are confirmed by experiment, though when the field significantly exceeds the critical value the domains themselves begin to move around and a generally turbulent state of motion ensues. It is in this state that the nematic is a strong scatterer of light.

Twisted Nematics.

For a static display device one needs a nematic which prefers to align parallel to an applied electric field (MBBA is not suitable) and the threshold field required to set a film of it into motion should be high enough to be irrelevant; this means that it should be made as pure as possible, to cut down its electrical conductivity.

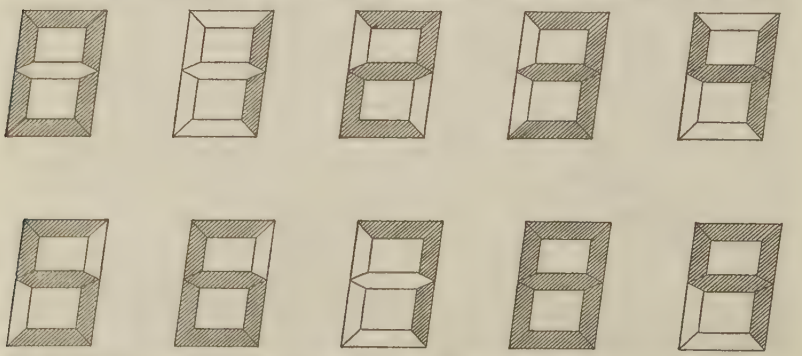

FIG. 3.—Ten different ways of switching on a single liquid crystal display panel so as to make different digits appear.

The film is supported by plates with selectively etched conducting coatings, as described above, but their inner surfaces are treated in such a way that one of them favours N-S alignment, as it were, while the other favours E-W alignment. In the OFF condition, *i.e.*, in the absence of any field, the nematic is therefore obliged to adopt the *twisted* configuration suggested by Fig. 4(a). In the ON condition, however, any part of the film that experiences a field changes to the quite different configuration suggested by Fig. 4(b). A distinction between the two conditions is apparent when the film is placed between crossed polaroids and viewed by transmitted light. In the absence of a field some light gets through the polaroids, because the twisted configuration of the nematic makes the plane of polarisation of the light beam twist in sympathy. In the presence of a field, however, the light is totally obscured.

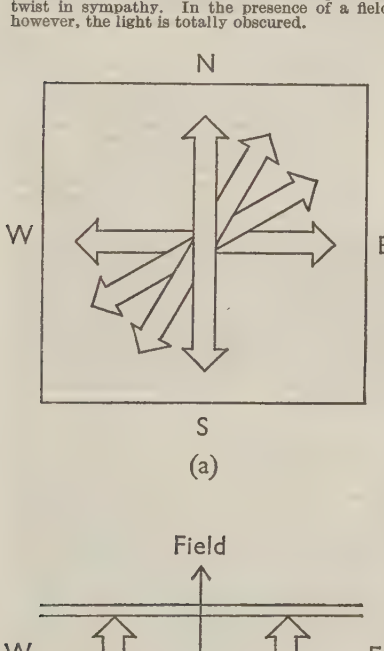

FIG. 4.—(a) The direction of alignment in a twisted nematic film, seen from above. The four double-ended arrows show how this direction varies with depth. (b) The same film, seen this time from the side, when a transverse electric field is applied; the alignment is now perpendicular to the film.

Many variations on this theme have been suggested, but static devices are still in an early stage of development and it is not yet clear which variations will prove most useful.

Cholesteric Liquid Crystals.

The diagram in Fig. 4(a) brings us back to the substance cholesteryl benzoate with which we began. This compound is one that can be synthesised in two distinct forms which are mirror images of one another. If the right- and left-handed forms are present in equal proportions, the intermediate state of cholesteryl benzoate has a structure of the normal nematic type, but if one form predominates the most stable configuration always has a twist in it, just like the twist that is imposed by very special boundary conditions on the nematic film sketched in the figure. The sense of the twist depends upon which form predominates. The larger the excess of one form over the other the tighter the twist becomes, but its pitch is always large compared with the size of a single molecule. The pitch is often comparable with the wavelength of light, and on this account specimens of *cholesteric* liquid crystals such as cholesteryl benzoate tend to show very beautiful interference colours, reminiscent of the colours shown by thin soap bubbles and oil films; cholesteric materials are said to be responsible indeed, for the iridescence of beetles' carapaces. The colours are extremely sensitive to temperature, and this fact has been exploited, both by doctors who wish to study local variations in skin temperature and by the designers of an elegant desk thermometer for discriminating executives which has recently appeared in the shops.

Lyotropic Liquid Crystals.

Liquid crystals which are pure substances can only be persuaded to change their state by changing their temperature, and on this account they are sometimes referred to as *thermotropic*. The so-called *lyotropic* liquid crystals are mixtures or solutions of one substance in another, in which changes of state can be initiated not only by heating or cooling but also by adding more of one of the constituents and hence changing the concentration.

All of us are familiar from everyday experience with the clear distinction that exists in nature between substances (like common salt) which dissolve readily in water and those (like grease of any kind) which dissolve readily in liquid hydrocarbons such as petrol. We are also familiar with the fact that a layer of grease will break down, on the vigorous application of soap, into tiny particles that water will remove. Soap has this effect because it consists of hydrocarbon molecules, for which the grease has a natural affinity, with salt-like atomic groups at the end of them. Each of the tiny particles of grease in the dirty water when you rinse your hands after washing is completely sheathed in soap molecules, with their hydrocarbon bodies on the inside and their salt-like, water-soluble heads on the outside.

Many different soaps are known to the organic chemist but in the ones of interest here the hydrocarbon part of the molecule is a long and fairly flexible chain. When dissolved in water these chain molecules have a tendency to aggregate to produce, even in the absence of grease, submicroscopic particles known as *micelles*, which are about twice as thick as the chain is long and are salt-like on the outside. In a dilute solution the micelles are no doubt irregular in shape and short-lived, but when a lot of soap is present it becomes meaningful to regard them as a species of supermolecule, more or less stable and of more or less uniform proportions. The micelles probably carry a negative electric charge and probably repel one another on that account. Strong soap solutions become liquid crystals when the conditions of temperature and concentration are such that, under the influence of their mutual repulsion, the micelles adopt an *ordered* arrangement.

A bewildering variety of lyotropic liquid crystals has been discovered. In some of them the micelles appear to be spheres, or perhaps polyhedra, and to be arranged on a three-dimensional super-lattice, just like the lattice in a simple solid composed of spherical molecules but larger in scale. In others, cylindrical micelles are preferred—still twice as thick as the length of a single molecule, but very much longer than they are thick—and these appear to be stacked together in an array which is ordered in two dimensions, often with six-fold symmetry like the array of cells in a honeycomb. In others again (and these are the ones which are to some degree analogous to thermotropic liquid crystals of the smectic type) the micelles appear to be lamellar and to be stacked like a giant sandwich, with layers of water between the layers of soap. Finally, when the amount of soap present actually exceeds the

amount of water the structure may turn inside out, as it were; there may be sub-microscopic spheres or cylinders of water, regularly arranged in a matrix of liquid soap.

All lyotropic liquid crystals are rather viscous, and those which contain a three-dimensional superlattice of micelles are very viscous indeed—in some cases more like a stiff jelly than a liquid and therefore liable to fracture. For the chemical engineer who is constantly pumping solutions through tubes it is a matter for obvious concern if a small change of concentration or temperature is enough to turn his working substance into a jelly, so an understanding of lyotropic liquid crystals is important in industry. The behaviour we have discussed is not confined to soap solutions. Evidence has recently been discovered, for example, that lyotropic liquid crystals occur during the carbonisation of pitch to produce coke.

Liquid Crystals in Living Things.

Liquid crystals are of interest to biologists as well as chemists and physicists, and not just because they account for the iridescence of beetles. Many biological processes of the utmost significance—nerve conduction is one example—involve the diffusion of sodium and other ions through cell walls, and for the processes to work properly the walls must have very special properties; they must let through some ions but not others and must in some cases be able to switch from a permeable to a non-permeable state or *vice versa* when the electric potential inside the cell changes. Cell walls are complicated systems composed of many different substances, some of which (the so-called phospholipids) are related to soaps. It is now generally believed that their special properties depend to a very large extent on the adoption by the phospholipid molecules of some sort of liquid crystal structure. On this aspect of the subject, however, a lot more research is needed.

PHYSICAL DATING TECHNIQUES IN ARCHAEOLOGY

Archaeologists are concerned with reconstructing and explaining the development of human society from its beginning with the first "tool-makers" approximately two million years ago up to the present day. In order to achieve this, the provision of a chronological framework is a basic necessity. The development of physical dating techniques has therefore had an immense impact on archaeology since many of these techniques provide essentially *absolute* dates which can be used to establish the temporal relationship between widely separated civilisations and thus build up a world-wide chronology. In addition, absolute dates provide an indication of the rate at which cultural and technological developments have occurred.

Prior to the advent of these methods, the archaeologist first established *relative* chronologies for a particular area based on sequences of artefacts (*e.g.*, flint and metal tools, pottery), either found in definite stratigraphic relationship to one another or exhibiting a definite typological development. Subsequently through the discovery of artefacts with a particular distinctive style on widely separated sites, the relative chronologies could be tentatively linked together. In some cases these relative chronologies could be ultimately linked to the absolute chronologies in areas for which approximate historical dates exist. However, historical dates exist for only a very small part of the period under consideration, the earliest being for Egypt and the Near East where they extend back to approximately 3000 B.C.

Radioactive Methods.

A wide range of physical methods of dating is now available and of these, the techniques based on the decay of radioactive isotopes are of primary importance. *Radiocarbon dating* of organic material is the most extensively used method and has had probably the greatest impact on archaeology. Although there appears to be significant deviations between the radiocarbon age and the true calendar age, it has provided the chronological framework on which prehistory, from approximately 50,000 B.C. onwards, is now based. *Thermoluminescent dating* of pottery also appears to have great potential and could be invaluable in supplementing radiocarbon dates in those periods for which pottery or fired clay is available; that is, with a few exceptions, back to approximately 6000 B.C. For the age determination of archaeological material more than 50,000 years old, radioactive isotopes (*see* F11) with half-lives longer than that of radiocarbon must be used. Although the dating techniques associated with these long-lived isotopes are more appropriate for dating rock formations older than 100 million years, by careful selection of samples, both *potassium–argon dating* and *fission track dating* can be applied to archaeologically relevant volcanic deposits and have been instrumental in establishing a chronology for the emergence of man, the "tool-maker".

Non-radioactive Methods.

Other physical dating methods are based on:

1. the progressive time-dependent chemical alterations of bone, obsidian and glass subsequent to their burial in the ground;
2. the variations in the direction of the Earth's magnetic field that have occurred in the past and which are recorded in the "fossilised" magnetism of fired-clay structures found *in situ* (*e.g.*, pottery kilns, hearths).

In contrast to the radioactive methods, these methods of dating do not provide a world-wide absolute chronology. Instead either relative dates for specimens taken from the same archaeological site are obtained or a calibration curve, using specimens of known age, must first be established for the specific geographical area under consideration. Although sometimes valuable in supplementing and refining the chronological framework provided by the radioactive techniques, these non-absolute methods are not discussed further in this article.

Potassium–argon Dating.

Potassium, which is one of the most abundant elements in the Earth's crust (approximately 2·8 per cent by weight), is present in most rocks and minerals. The radioactive potassium isotope (^{40}K), which is present as a constant fraction (0·012 per cent) of the total potassium, decays to form the stable argon isotope ^{40}Ar with a half-life of $1{\cdot}31 \times 10^9$ years (*see* F11). Because argon is a gas, the melting associated with the formation of volcanic rocks results in the expulsion of any existing ^{40}Ar and therefore at the time for formation, the ^{40}Ar concentration in volcanic rocks is usually negligible. Subsequently the ^{40}Ar concentration increases as a result of the decay of ^{40}K and from measurements of the concentrations of ^{40}K and ^{40}Ar, the time that has elapsed since the formation of the volcanic deposit can be calculated. In an archaeological context, it is then necessary to relate the volcanic deposit to the archaeological material under consideration.

The potassium content of the rock is determined chemically by means of flame photometry while the argon content is determined using a mass spectrometer, after first melting the rock sample in order to drive out the argon. The concentration of ^{40}Ar determined in this way includes both the radiogenic ^{40}Ar, formed from the decay of ^{40}K, and atmospheric ^{40}Ar which has been absorbed by the rock. An estimate of the atmospheric ^{40}Ar can be obtained by measuring the concentration of the argon isotope ^{36}Ar, which exists in the atmosphere as a constant fraction of the total argon but which is not produced by radioactive decay. However, for young rocks, the radiogenic ^{40}Ar forms only a small fraction (less than 10 per cent) of the total ^{40}Ar (radiogenic plus atmospheric) in the rock and therefore accurate measurement of the radiogenic concentration becomes progressively more difficult with decreasing age of the rock: in normal circumstances, contamination by atmospheric argon limits the application of the method to rocks older than 100,000 years.

A further major limitation to the use of the potassium–argon method for dating archaeological remains is that archaeological material does not

usually occur in association with the volcanic deposits.

Fission Track Dating.

The uranium isotope ^{238}U, in addition to decaying via a series of daughter products to form the stable lead isotope ^{206}Pb (*see* F11), also undergoes spontaneous fission in which the uranium nucleus disintegrates to form two heavy nuclei. Spontaneous fission is an extremely rare process, the ratio of the number of ^{238}U nuclei decaying by spontaneous fission to the number decaying via the normal series to ^{206}Pb being approximately 1 to $2{\cdot}2 \times 10^6$. The fission fragments are, however, extremely energetic and cause substantial damage to the crystal structure of the mineral in which the ^{238}U occurs. The fission damage tracks are submicroscopic but can be made visible, for counting under an optical microscope, by an etching process in which the damaged regions are preferentially dissolved.

The melting associated with the formation of volcanic rocks results in the removal of any existing tracks and therefore the number of fission tracks present at the time of formation of a volcanic deposit is zero. Subsequently tracks are created by spontaneous fission of ^{238}U and therefore the age of the volcanic deposit can be calculated from measurements of:

1. the number of tracks present in a defined area of the rock sample;
2. the concentration of the ^{238}U which is determined by counting the number of additional tracks produced in the same area by neutron-induced fission during a controlled neutron irradiation in a nuclear reactor.

The youngest volcanic deposits which can be dated by this method are typically 100,000 years old, this figure being for a rock which contains a few parts per million of uranium and assumes that the time spent in counting the spontaneous fission tracks is approximately two hours. With higher uranium concentrations or longer counting times, younger deposits can be dated but, as in the case of potassium–argon dating, the infrequent occurrence of archaeological material in association with volcanic deposits remains as a major limitation of fission track dating in archaeology.

Emergence of Man.

The earliest *dated* evidence of human culture, anywhere in the world, is provided by a group of artificially struck tools found in the area east of Lake Rudolf in Kenya. The tools were found in close association with a volcanic tuff for which a date of 2·6 million years was obtained from the potassium–argon method. A similarly early date has been obtained at the Olduvai Gorge in Tanzania where a series of potassium–argon dates for the sequence of volcanic deposits suggests an age of about 1·75 million years for the skeletal remains of *Zinjanthropus* (*i.e.*, Olduvai man) which have been found in these deposits. Both these results indicate that the emergence of man, the "tool-maker", occurred much earlier than half a million years ago, the date which had been suggested prior to the advent of potassium–argon dating. *See also* F49.

The date for the arrival of man in Western Europe is less well-established since no archaeological material has been found in close association with volcanic deposits. It has therefore been necessary to attempt to fit the geological strata (*e.g.*, glacial deposits, river terraces) containing this material into the sequence of glacial and interglacial climatic phases for which a tentative absolute chronology is provided by the dating of related, but often distant, volcanic deposits. On this basis, it has been suggested that the skeletal remains of Heidelberg man (*see* F50), which provide the earliest clear evidence for the presence of man in Western Europe, date from the Cromerian glaciation, at least 300,000 years ago.

Radiocarbon Dating.

The development of radiocarbon dating started in 1946 when W. F. Libby predicted the formation of the radioactive carbon isotope, ^{14}C, in the course of a study of the effect of cosmic rays on the Earth's atmosphere.

When cosmic rays (*see* F3) enter the Earth's atmosphere, slow neutrons are produced and they interact with atmospheric nitrogen (^{14}N) converting it to radiocarbon (^{14}C). The chemical behaviour of radiocarbon is the same as that of ordinary carbon (^{12}C) and it therefore forms heavy carbon dioxide which mixes with the ordinary carbon dioxide of the atmosphere. Atmospheric carbon dioxide enters the oceans as dissolved carbonates while plant-life grows by photosynthesis of atmospheric carbon dioxide and in turn, animals live off the plants. An equilibrium amount of ^{14}C exists on the earth since approximately 7·5 kg per year of ^{14}C are produced by cosmic ray neutrons while ^{14}C disintegrates to ^{14}N, emitting a beta particle (*see* F11), with a half-life of 5730 years. Consequently ^{14}C is distributed throughout the atmosphere, biosphere and oceans, the ratio of ^{14}C atoms to ^{12}C atoms being approximately 1 to $0{\cdot}8 \times 10^{12}$.

Living plants and animals therefore contain the above equilibrium proportion of ^{14}C. However, once dead, the plant or animal is no longer taking in carbon dioxide from the atmosphere so that the ^{14}C lost by radioactive decay is not replaced and therefore its concentration slowly decreases—by approximately 1 per cent every 83 years. Consequently, by measuring the ^{14}C concentration in, for example, dead wood and comparing it with the concentration in modern living wood, the age of the dead wood can be calculated.

The concentration of ^{14}C in the sample is determined by counting, with a gas-proportional or scintillation counter, the number of beta particles emitted as a result of its radioactive decay, a counting time of approximately 24 hours normally being necessary.

The basic assumption on which radiocarbon dating depends is that the atmospheric ^{14}C concentration has remained constant throughout the period (approximately 50,000 years) under consideration. To test whether this assumption is justified, a detailed series of radiocarbon dates have been obtained for known-age samples provided by historically dated wood from Egypt and by sequences of tree-rings. The true calendar ages for the tree-rings are determined by means of *dendrochronology* which depends on the fact that one tree-ring is formed annually and that its thickness is characteristic of the climatic conditions existing during its growth. It is therefore possible, by comparing distinctive groups of rings, to date a series of trees and by using the long-lived bristlecone pines, tree-rings dating back to 5000 B.C. have been obtained. In a living tree only the outer ring is in equilibrium with the atmosphere so that, in the context of radiocarbon dating, the inner tree-rings can be considered dead.

These measurements established that appreciable variations in the atmospheric ^{14}C concentration have occurred during the past 7000 years and that they were of two types:

1. a long-term increase in the ^{14}C concentration of approximately 10 per cent from A.D. 500 back to 5000 B.C.;
2. short-term fluctuations of a few per cent, lasting at most for a few centuries.

It is, at present, thought that these variations are due to changes in the ^{14}C production rate arising from changes in the earth's magnetic field, in the case of the long-term increase, and from changes in the interplanetary magnetic field associated with the solar wind (*i.e.*, patches of plasma sent out by the sun (*see* F4), in the case of short-term fluctuations. Both these magnetic fields tend to deflect the cosmic rays away from the earth and consequently an increase in either of them will cause a decrease in the cosmic radiation entering the earth's atmosphere and hence a decrease in the ^{14}C production rate.

Although further research is required, it is now accepted that, as a result of variations in the atmospheric ^{14}C concentration, the radiocarbon ages obtained for archaeological material are not strictly absolute. The approximate relationship between the radiocarbon and true calendar age for the past 7000 years has been established from measurements on tree-rings (**Fig. 1**). From this data it is apparent that, because of the long-term increase in the atmospheric ^{14}C concentration, the

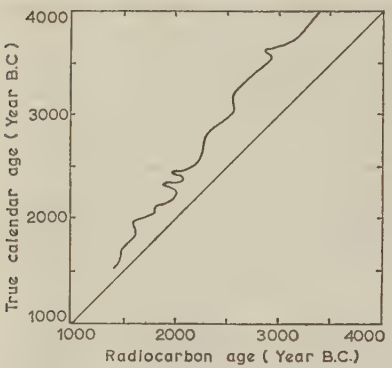

FIG. 1. The relationship between the radiocarbon age, calculated using the 5730-year half-life, and the true calendar age for tree-ring specimens from bristlecone pines for the period from 1000 to 4000 B.C.

radiocarbon age around, for example, 3000 B.C. is too young by approximately 600 years and that, because of the short-term fluctuations near, *e.g.*, 2000 B.C., a particular radiocarbon age can correspond to more than one true calendar age. However the reorganisation of the archaeologist's chronological framework, resulting from these corrections, is less drastic than that necessary following the publication of the first radiocarbon dates.

Development of a Farming Economy.

The phase during which man ceased to be a hunter and food-gatherer and started to produce food was of fundamental importance in man's advance towards civilisation. This development of a farming economy, which involved both the cultivation of cereals and the domestication of animals, led to a more static existence in which permanent village communities tended to replace nomadic groups. Associated with this change in the basic economy were a series of technological advances, including the production of pottery, while it also provided the basis for subsequent developments such as urban settlements, complex social hierarchies, literacy and metallurgy.

Although it was generally assumed that a farming economy was first developed in the Near East and that it subsequently spread westwards across Europe, the chronology for this development was extremely ill-defined prior to the advent of radiocarbon dating. On the basis of historical dates for Egypt and the Near East, it was suggested that the beginnings of agriculture occurred around 4000 B.C. and that it had spread to the British Isles by about 2000 B.C.

The radiocarbon dates now available indicate that this historically-based chronology was too short and that the earliest communities with an essentially farming economy appeared in the Near East by about 7000 B.C. By about 6000 B.C., there were farming settlements throughout a ten degrees of latitude zone between Greece and Iran while during the period from 5500 to 4000 B.C., a further expansion of this farming economy occurred north of the Mediterranean, through the Balkans and central Europe, and also westwards to Italy and Spain. Subsequently agriculture spread into northern Europe, reaching the British Isles by about 3500 B.C., into the Ukraine, down the Nile and across the Sahara.

Thermoluminescent Dating.

When an inorganic non-conducting solid is subjected to ionising radiation, free electrons are produced and some of these are trapped at defects (*e.g.*, vacancies, interstitials, impurity atoms, *see* F18) in the crystal structure. On heating, the electrons escape from their traps and if, as often happens, the electron now loses some energy by a further interaction with the crystal some light, referred to as thermoluminescence, is emitted, the intensity of the light providing a measure of the ionising radiation dose originally received by the solid. This phenomenon was first observed by Sir Robert Boyle in the 17th cent. while the present-day utilisation of the effect in applied physics results from the work of F. Daniels.

The possibility of dating ancient pottery by means of thermoluminescent measurements (Fig. 2) depends on the fact that, when the raw clay is

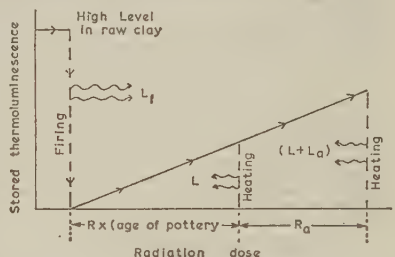

FIG. 2. Thermoluminescent history of a clay sample. L_f is the thermoluminescence emitted during the firing of the raw clay. L_a is the additional thermoluminescence emitted after exposure to a known radiation dose (R_a): the sensitivity (S) to ionising radiation is given by L_a/R_a.

fired to produce the pottery, the thermoluminescence acquired by the clay during geological times is removed. Subsequently, as a result of ionising radiation from radioactive impurities present in the pottery (*i.e.*, a few parts per million of uranium and thorium and a few per cent of potassium), the stored thermoluminescence increases linearly from zero. In order to determine the age of the pottery, it is therefore necessary to measure:

1. the natural thermoluminescence (L) stored at the present time;
2. the sensitivity (S) of the pottery to ionising radiation, that is the thermoluminescence induced per rad (1 rad = 10^{-2} J of absorbed energy per kg) of radiation;
3. the radiation dose (R rad) received by the pottery per year.

The age of the pottery is then given by:

$$\text{Age (years)} = \frac{L}{S \times R}$$

In order to apply this deceptively simple formula and obtain correct absolute ages, the inhomogeneity of the pottery fabric must be taken into account. Typically the pottery consists of a clay matrix in which mineral inclusions, ranging in diameter from less than 1μm up to 1mm, are embedded. It has been shown that the majority of the thermoluminesence originates from the mineral inclusions, principally quartz, whereas the major part of the radiation dose is due to alpha particles from the uranium and thorium and these impurities are carried predominantly by the clay matrix. Because of the short range (*see* F11) of alpha particles (20–50μm), the alpha dose received by the mineral inclusions depends critically on their size and consequently, in age determination measurements, grains within specific size ranges must be separated out.

Typically very fine grains (1–5μm diameter), in which the alpha particles will have suffered negligible attenuation, are employed. Both the natural thermoluminescence (L) and the thermoluminescence (L_a) induced by a known radiation dose (R_a) are measured with a photomultiplier, the samples being heated to 500°C, while the annual radiation dose (R) is calculated from measurements of the concentrations of the radioactive impurities in the pottery and the surrounding burial soil.

A series of test programmes, using pottery of

known age, has established the validity of the principles on which thermoluminescent dating is based and although the dates obtained are less precise (accurate to between ± 5 and ± 10 per cent) than had been hoped, the method should still be extremely valuable both in supplementing radiocarbon dating and in providing further data on the differences between radiocarbon and true calendar ages. In comparing the thermoluminescent and radiocarbon methods, it should be noted that an important feature of the former method is that the event dated (*i.e.*, the firing of the pottery) is well-defined and archaeologically significant. In contrast, when dating wood or charcoal by radiocarbon, it is possible that the inner rings of a large tree are being dated and their age could precede ancient man's involvement with the tree by several hundred years. Another advantage is that the pottery is itself of direct archaeological interest whereas organic material is only circumstantially related to the artefacts, including pottery, which are the archaeologist's chief concern.

Detection of Fakes.

In addition to age determination, a further important application of thermoluminescent measurements is the identification of fakes. Many fired-clay antiquities, including pottery and figurines, have considerable artistic merit and consequently command very high prices on the art market. Their "production" has therefore become a flourishing industry in some parts of the world and in many cases, the quality of the modern products is such as to deceive even the experienced museum curator. However thermoluminescent measurements on a few milligrams of material scraped from an unobtrusive part of the object can readily establish whether it is a genuine antiquity or merely a recent copy. For example, it has been shown by this method that 47 out of a group of 66 vessels and figurines, supposedly originating from the Neolithic site of Hacilar in Turkey and dating from the sixth millennium B.C., were modern forgeries.

BRITAIN'S ADOPTION OF A METRIC SYSTEM OF MEASUREMENT

The Origins of Measurement.

Some thousands of years ago when man wandered from place to place in groups, living on wild grains he gathered and the animals he hunted, there was no need for any system of measurement for trading with his fellows. Direct exchanges could be made on the spot.

The beginnings of civilisation came with the discovery—probably by woman as she did the grain-gathering—that life could be made more comfortable and secure if the seeds were planted and left to grow rather than eaten at once. The transition to agriculture changed man's nomadic way of life for the more settled life of a village community. The fertile valleys of the Tigris and Euphrates, of the Nile, the Indus, the Yellow River and the Yangtze were the favoured areas for the early civilisations. Agriculture and the revolution in food production made it possible for a given area to support a relatively high density of population. Then came the transition from village to city life and the new demands led to the need for counting and recording—to the beginnings of mathematics, surveying, map-making and astronomy. The writing of numbers seems to have come before the writing of words.

Numbers.

There can be little doubt that the decimal system of counting in tens originated in the use of a pair of human hands as a primitive accounting machine. The Babylonians inherited from the Sumerians a system of numbers which combined a decimal system with a sexagesimal notation (shifting a number one place to the left multiplied its value 60-fold). They compiled elaborate mathematical tables in their attempt to reconcile the lunar and solar calendars. Remnants of the sexagesimal system survive in the 360 degrees of the circle, the 24 hours of the day, the 60 minutes of the hour and the 60 seconds of the minute. From these early calendrical calculations came much of our algebra and arithmetic, including the world-wide system of numbers in which the digits depend on their position for their value (*see* Arabic numerals, L7). The earliest calculator was the abacus (L2), still in use in the Far East.

Length.

The earliest measurements of length were also made by making comparison with parts of the human body. Thus one of the earliest, the cubit, was the length of the forearm (from elbow to middle finger-tip) and the forearm was the Egyptian hieroglyphic for it. The digit was the width of a finger and other bases for comparison were the foot the palm and the span. Units derived in this way varied of course from person to person and had the further disadvantage that they bore no simple relation to one another. There were also variations from one country to another. These difficulties were overcome by a process of standardisation. A statue of a Sumerian king, *c.* 2350 B.C., for example, shows him with a rule on his lap, measuring 16 digits, just over half a cubit of 30 digits.

The Romans took over the Egyptian cubit and divided it into 16 digits as well as into 12 parts called *unciae*, the *uncia* being the origin of our inch. The double cubit seems to have been the basis for the English yard. For larger distances the *mille passus* (thousand paces) was used, a unit from which the English mile evolved. Some of the Roman measures were very inaccurate.

Weight.

The first scientific apparatus was the balance by which masses could be compared by weighing them. An Egyptian balance has been found dating from 5000 B.C. It seems that the original purpose of weighing was to evaluate precious metals and stones, and this may account for the astonishing accuracy of the early standard weights and the relation they bore to each other. Early coins were made of pieces of precious metal stamped with their weight and therefore of recognisable value and exchangeable for goods. Even today "a pound" is still a mass unit as well as a unit of currency.

The Roman pound was divided into twelve parts, just as the foot was, but whereas the uncial division of linear measure developed into the inch, that of weight developed into the ounce.

Volume or Capacity.

In the absence of trade over long distances, the ancient measures were localised, but the Roman measures did in fact spread throughout countries bordering the Mediterranean and there is some evidence that the *amphora*, an earthenware vessel used for transporting liquids, became a standard of capacity which equated roughly to the cubic Roman foot. There is also evidence of a Roman measure of capacity called the *congius* which was "standardised" by stipulating that the water contained in a congius should weigh ten Roman pounds. The parallel with the imperial gallon is interesting.

There are many who consider the distinction between "volume", as measured by the cube of a length, and "capacity", measured by giving a name to a known weight of water, is artificial and confusing. It would seem that this distinction originates in the early difficulty of measuring the dimensions of a liquid contained in primitively produced vessels of shapes which did not lend themselves to easy calculation. Accordingly, comparison of capacities was made by comparing the weights of water contained. We are no longer subject to such difficulty and so the artificial distinction between volume and capacity may be eliminated.

Evolution of Measurement in Europe.

The systems of measurement developed in Europe during the Middle Ages and up to the time of the French Revolution show clearly the successive influences of Roman, Barbarian, Islamic and Germanic dominations, while some original Celtic units survived.

The pound or *livre* in France or *lire* in Italy was both a currency and a mass unit. When used as a

mass unit it was variously divided into different numbers of ounces. It seems reasonable to suppose that 16 ounces to the imperial pound owes its origin to the ease with which the pound could be subdivided by halving, halving again and so on, whereas the original twelfth part could not be arrived at quite so easily.

Not only was the development of measuring systems very localised due to restricted travel and communication, but it seems to have been a matter of deliberate policy that different systems of measurement were adopted in different crafts in one locality. Hence such different systems of mass measurement as "avoirdupois," "apothecaries," and "Troy" or the different systems of measurement of volume which might be called "cubic measure" as against "apothecaries" measure, or "capacity measure."

Evolution of the Metric System.

With the advance of science during the 17th and 18th cents. scientists began more and more to rail against the confusion presented by such multiplicities of systems of measurement which militated against their sharing experiences with their international colleagues or, indeed, communicating their discoveries to the world at large. In the latter part of the 16th cent., a Flemish mathematician, Simon Stevin, recommended that, since the basis of counting was decimal (in tens) then the basis of measurement could with great advantage, also be decimal. The basis of the new measurement standards was to be scientific. The standard of length was to be a decimal fraction of the circumference of the earth's surface, through the Poles, and to this end an attempt was made to assess the length of the meridian quadrant through Paris by establishing the distance between Dunkerque, through Paris to Barcelona, all of which lie on a line of longitude. The metre was to be one ten-millionth part of the meridian quadrant. The standard for mass, the kilogramme, was to be the mass of a cubic decimetre of distilled water, measured in vacuum at the freezing point.

The metric system really became established in France after the French Revolution, a time when the destruction of many traditional practices was very much the order of the day. True standardisation of its basic units came in the first half of the 19th cent., and the metric system began to be adopted in other countries of Europe. In the latter half of the 19th cent., by invitation of the French Government, an international commission was established to lay down standards for the metre and the kilogramme. The recommendations of this commission were the subject of a treaty in 1875, but Great Britain was not a signatory until 1884.

The recommended standards were constructed and given into the custody of a neutral and international commission which today exists in Sèvres, just outside Paris.

While the metric system represented a most important advance on previous systems, it nevertheless retained many flaws.

Its unit of capacity, the litre, had been defined as the volume of a kilogramme of water at specified temperature and pressure but although the intention had been that it should equate to a cubic decimetre this had not precisely been achieved. At the beginning of the 20th cent. these definitions were such that 1 litre was equal to 1·000 028 cubic decimetres.

Just as in the mediaeval systems, different crafts used different units for what were really identical measurements, so in the metric system the practice grew of developing different units in different branches of science and technology for the measurement of identical physical quantities.

For example, energy came to be measured in calories (heat), ergs (mechanical energy or work), and kilowatt-hours for electrical energy. Indeed there developed no less than five different versions of the calorie. So some of the confusion resulting from the multiplicity of pre-metric systems persisted.

Evolution of the International System of Units (SI)

At the beginning of the 20th cent. scientists and technologists working with electricity saw that in their own field two distinct systems of measurement for related phenomena had grown up—the electrostatic and electromagnetic systems of units, and it was resolved to rationalise. At the same time it was appreciated that whereas the traditional metric system derived its more complex units by using the centimetre, the gramme, and the second as their basis, a more practical set of units could result from the use of the metre, kilogramme and second as the basis, and so the MKS system came into being. In the early 30s an Italian scientist, Professor Giorgi, pointed out that if a unit of electrical measurement were added as a fourth basic unit, a system could be constructed which would be satisfactory for uniform application in most sciences and technologies. The ampère was added, and so the MKSA (or Giorgi) system was born.

In 1960, the General Conference on Weights and Measures, an international body of which the UK is an active member, recommended that if the MKSA system were enlarged by the addition of basic units for the measurement of light and temperature then a system could be constructed which would be acceptable for uniform application across the whole spectrum of science and technology. This system it was proposed to call Système International d'Unités (International System of Units) for which the abbreviation in all languages would be "SI."

SI thus consists of six basic units:

metre (m)	length
kilogramme (kg)	mass
second (s)	time
ampère (A)	electric current
candela (cd)	luminous intensity
kelvin (K)	temperature.

See Section L under their individual names, *also* Scientific Units, L104.

There are two supplementary units which are dimensionless, being really ratios:

radian (rad)	plane angle
steradian (sr)	solid angle.

It is very possible that a seventh basic unit, the mole (mol), for the measurement of quantity of matter may be added. *See* F21 (2).

Everyday Use of SI.

In our everyday life we shall speak of kilogrammes (or kilos) rather than pounds, and of grammes rather than ounces; instead of pints we shall speak of litres or decimal fractions of a litre; by now many of us will be accustomed to the 5 millilitre doses of medicine; on the road we shall measure distances in kilometres (or kilos) instead of miles and put litres of petrol into our tanks instead of gallons; in the draper's shop the metre will replace the yard; for land measurement the hectare will be used where we have hitherto used the acre. Such oddities as fathoms, rods, poles, perches, chains, and furlongs, to say nothing of the inconsistently related inches, feet, yards, and miles will cease to bemuse us. The wine trade will, we trust, cease to be bothered with a hogshead whose capacity is different according to whether it contains port, sherry, madeira, etc. *See* N8 for Metric Equivalents.

It is easy, with hindsight, to poke fun at the imperial system with its rambling and inconsequent relationships between units, but if the history of its evolution over 5,000 years be studied, each of its "oddities" is seen to have had a perfectly logical justification in the circumstances of the time when it was established. However, the circumstances in which measurements are made today are totally different, and a rationalised and coherent system of units such as SI is an absolute necessity.

SI in Science and Technology.

SI is rational in that it admits of only one measurement unit for any one physical quantity, thus obviating the need for hosts of conversion factors. SI is coherent in that from only six basic units and two supplementary units are derived any and every unit used in any science or

technology, thus building a bridge between all disciplines, provided only that in forming derived units from the basic units the rule is observed that "the product or quotient of two or more units shall be the unit of the resultant quantity."

Thus the coherent unit for velocity is the metre per second (m/s). The kilometre per hour (km/h) is not coherent. It will undoubtedly be in everyday use for road speeds, but will be awkward to use in technical calculations where a coherent result is required. The unity relationship which is characteristic of coherence is to be noted. "*One* unit of velocity derives from *one* unit of displacement per *one* unit of time"—not 1000 units of displacement per 3600 units of time.

Similarly the coherent unit for acceleration is the metre per second per second (m/s^2). From this we may arrive at the coherent unit of force, which is most important, since it is an ingredient of many units—energy, power, viscosity, pressure, stress, etc. Applying Newton's second law of motion, we arrive at our unit of force by stipulating that it shall be the force which, applied to a body of unit mass, produces in it unit acceleration in the direction of application. The British scientist Newton has been commemorated in naming this unit and we have: 1 newton (N) = 1 kg m/s^2.

From this we may proceed to a unit for energy or work, the N m, which is called the joule (J), and a unit for power (or rate of doing work) the N m/s = J/s which is called the watt (W).

Clearly, another advantage of SI is that given a knowledge of:

(*a*) the six basic and two supplementary units

(*b*) scientific first principles, and

(*c*) the principle of coherence,

the whole range of derived SI units may be very simply deduced whereas with the rambling and inconsequent traditional metric system or imperial system a very great deal of sheer memory work was involved.

Disciplined Choice of Multiples and Sub-multiples.

The range of multiples and sub-multiples (from 10^{-18} to 10^{18}) is given below. In the practical application of SI the recommended rules are:

1. Use only multiples which are of value $10^{\pm 3n}$ (where n is an integer).

2. Do not use double prefixes.

3. Choose that multiple or sub-multiple which enables the required value to be expressed with no more than three integers as coefficient.

4. Do not modify units which have the form of a quotient, except by modifying the numerator.

Examples of the application of these rules are:

(*a*) Express 0·000 000 015 m as 15 nm (Rules 1 and 3) NOT as 15 mμm (Rule 2).

(*b*) Express 400 000 000 N/m^2 as 400 MN/m^2 (Rules 1 and 3) NOT as 400 N/mm^2 (Rule 4).

In the great majority of cases, these rules will prove perfectly practicable to apply and will secure that (*a*) A minimum variety of different multiples and sub-multiples will come into common use; (*b*) in given circumstances two people working miles apart will select the same multiple or sub-multiple and present it in identical fashion; (*c*) the presentation of multiples and sub-multiples will always be such as to make their relation to the coherent unit simple and obvious.

Greater detail of SI may be found in the National Physical Laboratory's *Changing to the Metric System*, a pamphlet published by HMSO, and in the British Standards Institution's booklet PD 5636 *The Use of SI Units* which is obtainable from BSI Sales Branch, Newton House, 101–113 Pentonville Road, London, N.1.

MULTIPLES AND SUB-MULTIPLES OF UNITS

Multiplication factor		Prefix	Symbol
1 000 000 000 000	10^{12}	tera	T
1 000 000 000	10^{9}	giga	G
1 000 000	10^{6}	mega	M
1 000	10^{3}	kilo	k
100	10^{2}	hecto	h
10	10^{1}	deca	da
0·1	10^{-1}	deci	d
0·01	10^{-2}	centi	c
0·001	10^{-3}	milli	m
0·000 001	10^{-6}	micro	μ
0·000 000 001	10^{-9}	nano	n
0·000 000 000 001	10^{-12}	pico	p
0·000 000 000 000 001	10^{-15}	femto	f
0·000 000 000 000 000 001	10^{-18}	atto	a

ELEMENTS

Element (Symbol)	Atomic Number	Atomic Weight	Valency

zirconium (Zr)	40	91·22	4

* In the cases of these elements, which are very rare or not found in nature, but have been artificially prepared, atomic weight in the chemical sense is meaningless; the integral mass of the most stable isotope known is given.

Note: In 1961 the isotope of Carbon-12 replaced Oxygen as a standard, the weight of its atom being taken as exactly 12. This change of standard has meant a slight adjustment in atomic weights from the old chemical scale.

The new elements with an atomic number higher than that of uranium 238 (element 92) are termed Transuranics.

GAS LAWS

Boyle's Law (1662) $pV = \text{constant}$.

Charles' Law (1787) $\frac{pV}{T} = \text{constant}$.

Van der Waal's equation $\left(p + \frac{a}{V^2}\right)(V - b) = RT$ where a and b are constants.

Adiabatic expansion of a gas $pV^{\gamma} = \text{constant}$ where $\gamma = \frac{C_p}{C_v}$.

BACKGROUND TO ECONOMIC EVENTS

The aim of this section is to help the ordinary reader to follow economic events as they happen, and to understand the controversies that accompany them.

TABLE OF CONTENTS

I. Central Problems of Economic Policy 4–5

Unemployment
Inflation
The Balance of Payments
Economic Growth
Underdeveloped Countries
The Inter-relationship of Economic Problems

II. Survey of the British Economy 5–28

Incomes Policies
The Price Commission and the Pay Board
Stage Three
Relativities
Tax Reforms

BACKGROUND TO ECONOMIC EVENTS

This section is divided into four parts. Part I gives a brief description of the most important problems of economic policy. Part II is concerned with a more detailed survey of the British economy and the way in which it operates. In the course of this survey, the specialised terms used by economists are explained, and the attempt is made to present an intelligible summary of the information, facts, and figures relevant to an understanding of economic events. There are five main sub-sections: International Trade and Payments; Employment, Production, and Industry; Incomes, Wages, and Prices; Money, Banking, and Finance; and Economic Aspects of the Public Services. Part III outlines the main economic problems faced by the underdeveloped countries, and the economic policies of Britain and other developed countries towards the underdeveloped world. Some suggestions for further reading are given at the end of Parts II and III. Part IV is written as shortly before publication as possible, and contains a survey of recent developments in the British economy.

I. CENTRAL PROBLEMS OF ECONOMIC POLICY

Unemployment.

Between the wars, unemployment was Britain's most urgent economic problem. The level of unemployment varied with the ups and downs of the trade cycle. Quite the worst slump was that of the early 1930s: in 1932, nearly 3 million workers were without a job. But unemployment remained high even in the best years, and in no year between 1919 and 1939 were there fewer than a million workers unemployed. Economists make a distinction between *structural* unemployment and *cyclical* unemployment. Structural unemployment appears when the structure of industry gets out of line with the pattern of demand for industrial products. In Britain, unemployment was particularly severe and persistent in areas which were dependent on the coal, textile, and shipbuilding industries, and some sections of the engineering industry. These industries had been in the forefront of Britain's industrial growth in the 19th cent., and had contributed greatly to the expansion of exports. In areas like South Wales, Tyneside, Clydeside, and Northern Ireland there was little alternative work for those no longer needed in the "staple" industries: new industries were being built up in the inter-war period, but they tended to be located in the relatively prosperous Midlands and South-East England. Cyclical unemployment appears when there is a general decline in the level of demand for goods and services, which leads to a decline in the employment of workers producing those goods and services. In the slump years unemployment was so high because of a combination of structural and cyclical unemployment; in the best years, unemployment was largely structural.

Unemployment means waste. Men willing to work, who could produce valuable goods and services, are idle; the economy produces fewer goods and services than it is capable of producing. Unemployment also means hardship and low standards of living for those out of work, and for their families.

The avoidance of mass unemployment has been accepted as a primary objective of economic policy by all political parties, and there is a wide measure of agreement on the policies which must be applied to ensure that unemployment on the scale of the 1930s never occurs again. Cyclical unemployment has to be tackled by measures to increase total demand and total spending by consumers, by investors, and by the Government. Structural unemployment has to be tackled by inducing new industries to move into areas where other employment is declining, or by inducing labour to move from those areas to areas where there is a demand for its services.

There have been ups and downs in unemployment in the post-war years, but these have been very slight until recently, compared to those before the war. In most post-war years, less than 2 per cent of the working population was unemployed —a sharp contrast with the 11 per cent for 1937 and the 22 per cent for 1932. But there are still areas of the country where structural unemployment is serious. In Northern Ireland, for example, despite the efforts which have been made to attract new industries, unemployment ranged between 6 and 10 per cent in the last decade.

Inflation.

A characteristic of the British economy in post-war years has been a persistent rise in prices and money incomes. For example, between 1960 and 1970, retail prices went up by about 52 per cent or—expressed as an annual rate—by 4·3 per cent per annum, export prices rose by 40 per cent (or 3·4 per cent per annum), and weekly wage rates by about 67 per cent (5·3 per cent per annum). However, these rates of increase were somewhat slower than the corresponding rates in the immediately post-war decade, or the annual inflation of 8 per cent between 1970 and 1973. Inflation can be harmful in various ways. Firstly, it is associated with an arbitrary redistribution of purchasing power. Prices rise for everyone, but some members of the community are better placed than others to secure increases in their money incomes which offset, or more than offset, the rise in the price of the goods and services they buy. The feeling that particular groups are falling behind, in that their money incomes have not risen as fast as those of other groups, is a source of much unrest and discontent. Secondly, and crucially for the British economy, an inflation of prices makes it more difficult to achieve a satisfactory balance of payments. As prices of our exports rise, it becomes harder to sell them in foreign markets; and as imports become cheap in comparison with goods produced at home there is a tendency to buy more of them.

Two main explanations have been advanced to account for the inflation which has occurred. The first stresses the role of an excess of demand or spending power in the economy—of too much money chasing too few goods, and so leading to a rise in prices. The inflationary problem is seen as the obverse of the cyclical unemployment problem: the latter involves a deficiency of spending, and the former an excess. Those who consider an excess of demand (*demand-pull*) to be an important factor in the inflationary situation favour policies designed to reduce purchasing power: for example, the reduction of spendable income by levying higher taxes, or the reduction of spending financed through borrowing by making credit more expensive or more difficult to get. The second stresses the role of an excessive increase in incomes: it is argued that prices have risen mainly because costs have increased faster than productivity (*cost-push*). Those who take this view favour measures to restrain or control increases in wages, profits, rents, and other forms of income. Neither explanation excludes the other. Many would agree that both demand-pull and cost-push factors have contributed—with different strengths at different times—to the in-

flationary spiral in prices and incomes, and that measures both to control demand and to restrain or control incomes may be necessary.

But it is easier to specify in general terms the measures needed to combat inflation than it is to apply policies which are successful in practice. In particular, policy measures to restrain or control wage increases are difficult to reconcile with widely-accepted procedures of collective bargaining.

The Balance of Payments.

Britain is heavily dependent on imports. This country must import food: it cannot produce enough food within its borders to feed its population. Many of the raw materials necessary for its industry have to be purchased from abroad. Furthermore, some manufactured goods produced in other countries will be purchased because they are cheaper or more attractive than similar goods produced at home. All these goods, and our imports of services, have to be paid for in foreign currency. Foreign currency is earned by exporting goods and services to other countries. It is not, however, considered sufficient to earn enough foreign currency from our exports to pay for our imports. The objective is to earn considerably more than that, so that we have a surplus of foreign currency available to pay off external debts, to build up our external assets by investing abroad, to enable us to lend and give aid to underdeveloped countries, and to increase our foreign exchange resources.

Since the war, our balance of payments position has been precarious. Exports have increased considerably, but so have imports; and the margin of safety has been so narrow that unfavourable turns of events have led to crises in the balance of payments. In several years, our earnings from the export of goods and services have not even been sufficient to cover our payments for imports, and in almost none has the surplus been as large as is considered necessary. With the balance of payments delicately poised even in favourable years, and with corrective action necessary in crisis years, economic policies have been much influenced by our foreign trade problems. It is easy to say that most of the problems would disappear, or would become less urgent, if we could achieve a major expansion of our exports. But most export markets are highly competitive, and we cannot expect to sell more unless the price, quality, and terms of delivery of our goods and services are at least as attractive as those of our rivals in export markets.

Economic Growth.

Taking a longer view, the most important objective of internal economic policy must be to raise the standard of living. The standard of living can increase only if more goods and services are produced per head of population. In a fully-employed economy, the main source of increased output is a higher productivity—output per person—of the working population.

Standards of living in this country have been rising: the output of goods and services per head of population increased by about 21 per cent between 1960 and 1970; *i.e.* by 2 per cent per annum on average. Nevertheless, many economists are of the opinion that the rate of growth of output and productivity can be, and should be, increased. In particular, they point out that our rate of growth compares unfavourably with that achieved by some other countries. The potentialities for higher productivity are enormous. The U.S.A. has the highest standard of living in the world: in many industries, output per person employed is twice or more than yet attained in this country. In order to achieve a higher level of productivity in this country, more and better machinery and capital equipment will have to be installed; also, work will have to be planned, organised, and controlled in such a way as to make more effective use of labour and machinery.

Underdeveloped Countries.

Britain and the other developed countries of the world have important responsibilities towards the underdeveloped countries. The poorest two-thirds of the world's population account for only a sixth of total world income and output, while two-thirds of world income accrue to the richest sixth of world population, a category which includes Britain. The poorest two-thirds suffer from poverty, hunger, malnutrition, debilitating diseases, and widespread illiteracy. To make matters worse, most of the poor countries are experiencing a rapid growth of population. Output has to rise as fast as population just to prevent standards of living from falling, and an increase in standards of living requires an even faster growth of output.

Few underdeveloped countries can hope to solve the increasing problems they face without active and generous help from developed countries. This help must take many forms. Financial aid in the form of grants or loans in order to place resources at the disposal of underdeveloped countries which they would otherwise not be able to obtain; technical aid to assist in the solution of the many technical problems which have to be solved; trading policies which do not hinder underdeveloped countries from getting the imports they need or from selling their exports—these are all activities in which Britain should play her part. In particular, Britain must contribute to the development of the underdeveloped countries of the Commonwealth.

The Inter-relationship of Economic Problems.

Each of the problems briefly described above is extremely complex. The difficulties of achieving successful solutions are further aggravated by the fact that the problems are inter-related in such a way that measures which are helpful for one problem can make others more difficult to solve. For example, a reduction of purchasing power might be considered helpful in the control of inflation, and might ease balance of payments problems by reducing—or slowing down the increase of—imports. But it could also lead to an increase in unemployment, and to a slowing down in the rate of growth of the economy. Or again, a reduction in aid to underdeveloped countries could make it easier to balance our external accounts, but such action could hardly be reconciled with our responsibilities towards underdeveloped countries. In the next section, particular aspects of the British economy are considered in some detail; the final section discusses the main features of the development of the economy since 1960.

II. SURVEY OF THE BRITISH ECONOMY

1. INTERNATIONAL TRADE AND PAYMENTS

International Trade.

(i) Imports and Exports.

In 1970 the United Kingdom bought from abroad goods to the value of £9,052 million, or about £160 per head. Food is a large item in this bill, accounting for 22 per cent of the total. Fuel, largely oil, costs about 10 per cent, basic materials for industry 15 per cent, and manufactured goods (a category that includes a large number of semi-manufactured goods bought for further processing) 51 per cent. This last category of imports has increased sharply in recent years. In 1954 it represented only 20 per cent in an import bill of only £3,359 million. All this can be seen in the table.

There are three main determinants of the level of British imports. One is the competitiveness of British with foreign producers. Britain imports those commodities which—at the current exchange rate between the pound and foreign currencies—can be bought more cheaply from

foreign than from home producers. Secondly, the level of imports depends on the extent to which free trade is prevented by tariffs on imported goods or by other devices. Thirdly, as total incomes in the economy expand, there is a general increase in the demand for goods and services, including imports. Therefore imports can be expected to vary directly with the total

UNITED KINGDOM IMPORTS AND EXPORTS

Imports of goods (c.i.f.)	£ million.		Percentage of total.	
	1954.	1970.	1954.	1970.
Food, drink, and tobacco	1,314	2,052	39	22
Basic materials	1,015	1,364	30	15
Fuels and lubricants	329	946	10	10
Semi-manufactures	513	2,510	15	28
Finished manufactures	174	2,070	5	23
TOTAL*	3,359	9,052	100	100
Exports of goods (f.o.b.)				
Food, drink, and tobacco	154	514	6	6
Basic materials	101	273	4	3
Fuels and lubricants	151	207	6	3
Metals	338	959	13	12
Engineering products	1,007	3,510	38	44
Textiles	324	397	12	5
Other manufactured goods	490	1,942	18	24
TOTAL*	2,650	8,063	100	100

* The column figures do not add up to the totals because the former exclude postal packages.

of incomes in the economy, known as the *national income*.

One would expect that the liberalisation of trade since the early 1950s, together with a decline in the competitiveness of British producers, would have produced an expansion of imports relative to national income. In fact imports as a proportion of national income were the same—23 per cent—in 1970 as in 1954. One reason why the proportion of imports did not rise was the sluggish demand for *primary products* such as food and raw materials. The British spend little of their additional income on imported food, and the development of synthetic substitutes and new products has slowed down the growth in demand for raw materials. Moreover, since the demand for primary products of this sort has been sluggish on a world scale, while supply has increased, their price has fallen in relative terms, and this too has reduced the total cost of British imports.

Since the exports of one country must be the imports of another, the same factors in reverse, foreign competitiveness, access to foreign markets, and the level of foreign incomes determine the level of British exports. In 1970 these amounted to £8,063 million, of which no less than 85 per cent were manufactures, mainly engineering products. In 1954 it was true to say that Britain gained from trade by exporting manufactures, in which she had a *comparative advantage*, in return for food and raw materials, which she was not suited to produce. This is still partly true; but increasingly—with the growth of trade and specialisation among the major economies—Britain gains from trade by exporting those manufactures in which her producers specialise and importing other manufactures. Among the main manufacturing exports are cars and commercial vehicles, tractors, aircraft and aircraft engines, finished steel, various forms of machinery, woollen fabrics, man-made fibres, and books; among the main manufactured imports are wood products, aluminium, newsprint, cars, and aircraft.

(ii) The Terms of Trade.

Between 1954 and 1970 the value of British exports and imports approximately tripled. These changes can be separated into two components, price and volume. Imports rose in price by only 28 per cent, whereas export prices rose by 53 per cent. The ratio of the average price of exports to that of imports is known as the *terms of trade*; and a rise in the price of exports relative to imports indicates an improvement in the terms of trade. Thus, when we note in the table that the terms of trade improved by 16 per cent between 1954 and 1970, we mean that, in 1970, 16 per cent less exports by volume would have been needed to buy the same amount of imports as in 1954. This improvement in the terms of trade reflects the fact that the prices of many primary products—food and raw materials such as wool, cocoa, rubber, or oil—fell or stagnated in world markets over the period (*see* G29).

VISIBLE TRADE: VOLUME AND PRICES

	1961 = 100.		Percentage increase 1954–70.
	1954.	1970.	
Value			
Imports	76	206	171
Exports	72	219	204
Volume			
Imports	74	157	112
Exports	80	155	94
Price			
Imports	103	132	28
Exports	89	136	53
Terms of trade	116	97	−16

(iii) The Volume of Trade.

Superficially it would appear that any improvement in the terms of trade raises the value of British exports relative to imports. However, this is not always true: faster inflation in this country, leading to a more rapid increase in export prices, would harm rather than help the balance of payments. If the prices of our export goods rise faster than the prices of our competitors in overseas markets, it will become progressively more difficult to sell our exports. Conversely, an inflation in Britain will make it progressively more attractive to buy goods produced abroad. Partly because of the slower growth of import prices than of export prices, the volume of imports increased more rapidly than the volume of exports over the period 1954–70. The trade balance may well be helped by a fall in the price of imported primary products; but the balance of trade in manufactures will be worsened by an improvement in their terms of trade.

In the post-war period there was a considerable fall in Britain's share of world exports; from 20·0 per cent of exports of manufactures in 1954 to 16·4 in 1961 to 12·3 in 1967, the year of sterling devaluation, to 10·8 in 1970. The fall was persistent: in no year did Britain's share increase. Her competitors in export markets—and particularly Germany, Italy, and Japan—were more successful in expanding their exports. Had the prices of British exports risen less rapidly over the period, Britain's share of world exports would have been higher in 1970.

The Balance of Payments.

The *balance of payments* is an account of the total transactions of one country with the rest of the world. To illustrate the balance of payments and its components, the British accounts for two years are presented in the table; accounts for a bad year, 1964, and for a good year, 1970. A detailed examination of recent movements in the British balance of payments is made in Part IV (*see* G 32–36).

BALANCE OF PAYMENTS OF THE UNITED KINGDOM, 1964 AND 1970

(£ millions)

	1964.	1970.
Exports (f.o.b.)	4,817	7,885
Imports (f.o.b.)	5,054	7,882
Visible balance	−519	+3
Invisible balance	+143	+576
of which: private services	+182	+550
Government military transfers	−268	−285
other Government services and transfers	−164	−201
interest, profits, and dividends	+393	+512
Current balance	−376	+579
Official long-term capital	−116	−204
Net private investment	−256	+13
of which: overseas investment in U.K.	+143	+727
U.K. investment overseas	−399	−714
Other capital flows	+73	+939
Balancing item	−20	+93
Total currency flow	−695	+1,420
Net borrowing from IMF*	+357	−134
Net borrowing from other monetary authorities*	+216	−1,161
Change in reserves*	+122	−125
Total official financing*	+695	−1,420

* A plus sign denotes a rise in liabilities or a fall in assets, and a minus sign a fall in liabilities or a rise in assets.

(i) The Balance of Visible Trade.

The *balance of (visible) trade* is the difference between exports and imports of goods. It is said to be in *surplus* if exports exceed imports and in *deficit* if imports exceed exports. In estimating the balance of trade it is important that imports and exports be valued on the same basis. The normal method in the trade returns is to measure imports *c.i.f.* (cost, insurance, and freight) and exports *f.o.b* (free on board). In other words import prices are shown to include the costs of transporting them to Britain, and exports are valued at the prices when loaded in British ports. Our table shows both imports and exports *f.o.b.*

Britain's visible balance is normally in deficit. The trade balance was actually in surplus in 1970, but this was for only the seventh time since 1800! On the other hand, the year 1964 was exceptional in the large size of its deficit.

(ii) The Balance of Invisible Trade.

The chronic deficit in the balance of visible trade has in normal years been offset by a surplus in the *balance of invisible trade*. This relates to international transactions in services as opposed to goods. It comprises four main groups of transactions. The first covers receipts from non-residents *less* payments to non-residents for services such as shipping, civil aviation, tourism, insurance, and financial services. The second covers receipts from foreign governments in respect of military bases in the country *less* payments by this country in respect of military bases abroad. The third covers receipts of gifts and grants made to this country, *less* gifts and grants made by this country. The fourth includes all receipts of interest, dividends, and profits earned on overseas investment *less* interest, dividends, and profits paid out on foreign investment in this country.

(iii) The Balance on Current Account.

The surplus on invisibles usually exceeds the deficit on visibles, so that Britain earns a surplus in the *balance on current account*, comprising both visible and invisible trade. The year 1964 was exceptional in this respect.

In 1970 just over a quarter of British visible trade was with the countries of the *Overseas Sterling Area*—comprising the independent Commonwealth countries other than Canada, the remaining colonial territories and a few countries such as South Africa, the Republic of Ireland, and some Arab oil-producing states. Almost 40 per cent of our visible trade was with Western Europe—20 per cent with the EEC and 15 per cent with our EFTA partners (*see* G39)—and rather less than 20 per cent with North America. The current balance of payments surplus found in normal years is generally made up of a large surplus with sterling area countries partially offset by a deficit with the non-sterling areas.

(iv) Capital Flow.

It is not sufficient simply to avoid deficits on current account. It has been the Government's objective to earn a surplus in order to finance investment abroad, to repay foreign debts previously incurred, and to build up reserves of gold and foreign exchange which can help to tide us over periods of deficit in the future. In fact a surplus of the magnitude aimed at by the Government was only rarely achieved.

The capital account of the balance of payments contains net official long-term capital movements (*e.g.*, inter-government loans to less developed countries), net private investment abroad (being the difference between investment abroad by United Kingdom residents and investment by foreigners in the United Kingdom). Both these items are normally in deficit and tend to be long-term movements. Usually they involve a deficit with the sterling area and only minor imbalance with the rest of the world.

There are also large, short-term capital flows, sometimes referred to as *monetary movements*. These include trade credits, changes in sterling reserves held by foreign governments, and Eurodollar transactions. Such funds can be highly volatile, moving out of a currency if there is a risk of its devaluation and into it if there is a chance of revaluation upwards or if other currencies are suspect. Therefore, monetary movements often accentuate a surplus or deficit in the other items of the balance of payments; as happened in 1970.

(v) Total Currency Flow.

The bookkeeping identity of international payments and receipts may be illustrated by reference to the year 1964. In that year the United Kingdom had a deficit on current and capital account of no less than £675 million. In other words, there was a net demand to transfer funds from sterling into other currencies. Since the monetary authorities would not permit the market price of sterling to fall, this excess demand had to be met from official sources. The deficit could be financed by an increase in liabilities, *i.e.*, by government borrowing from abroad, or by a reduction in assets, *e.g.*, a depletion of the official gold and foreign exchange reserves. Total net official financing recorded was in fact £695 million, so that there must have been an unrecorded capital outflow equal to £20 million, known as the *balancing item*. The *total currency flow*, equal to the *total official financing*, was therefore £695 million.

(vi) Foreign Exchange Reserves.

The gold and convertible currency reserves are used to finance payments abroad which cannot be financed in any other way: they are a last line of defence in international trade. The reserves held in London belong to the sterling area as a whole, and not just to this country. Members of the sterling area are willing to pay into these central reserves some or all of their net earnings of gold and convertible currencies in exchange for sterling balances. They do this on the understanding that they can, should they wish to do so, call upon the central reserves by exchanging sterling balances for gold and convertible currencies.

The central reserves of gold and foreign currencies amounted to £1,180 million at the end of 1970; a level which, though higher than in many previous post-war years, was still low. There are bound to be imbalances in international trade and payments, and the function of these reserves is to tide over temporary imbalances by increasing reserves in favourable periods and running down reserves in unfavourable periods. If reserves are not sufficient to withstand temporary pressures, measures to protect the reserves will have to be taken—*e.g.*, raising Bank Rate and tightening up monetary policies generally—and these measures may create unemployment and recession, and restrict the growth of the economy.

Correcting a Deficit.

If an imbalance in the total currency flow persists, the deficit cannot be met indefinitely from official financing. At some stage the Government must take action to remove the deficit. What action can it take? There are a number of alternatives available, each with its advantages and disadvantages, and economic opinion is by no means unanimous on the choice of policy. Let us consider each of these alternatives in turn.

(i) Variation of the Exchange Rate.

The *exchange rate* is the ruling official rate of exchange of pounds for gold and other currencies. It determines the value of British goods in relation to foreign goods. If the pound is devalued in terms of gold and other currencies, British exports (which are paid for in pounds) become cheaper to foreigners and British imports (paid for by purchasing foreign currency) become more expensive to holders of pounds. In this way *devaluation* can improve the British balance of payments position by encouraging exports and discouraging imports.

But there are certain disadvantages attached to devaluation. The prospect of devaluation results in a speculative outflow of capital funds: and one devaluation may be taken as a sign that there will be further devaluation in the future. Secondly, until 1968 it was true that the sterling area countries—many of them underdeveloped—would suffer a capital loss, because they hold their reserves largely in the form of sterling rather than gold (*see* G9). Thirdly, the rise in the price of imports of raw materials and consumption goods results in higher costs and prices and then in wage demands to maintain the British standard of living. It is possible that inflation will in this way neutralise the beneficial effects of devaluation.

The pound was devalued in 1949, when an official exchange rate of £1 = $2·8 was established, and again in 1967, to a rate of £1 = $2·4. During 1971, when, as a result of the dollar crisis, exchange rates were allowed to fluctuate, the rate varied between £1 = $2·4 and £1 = $2·5. After the devaluation of the dollar in December 1971, the rate with gold remained unchanged, but the exchange rate with dollars became £1 = $2·6. After June 1972 the value of sterling in relation to other currencies was allowed to *float*. It fluctuated, but the tendency was to float downwards: in February 1974 the pound equalled $2·30 (*see* G35).

(ii) Exchange Controls and Convertibility.

A currency is fully *convertible* if it can be freely exchanged for any other currency, or for gold, at the ruling official rates of exchange. Exchange controls impose restrictions on convertibility by limiting the powers of holders of a currency to exchange their holdings for other currencies or gold at the official rate of exchange. In the post-war period there was a world-wide shortage of dollars: if sterling had been convertible, there would have been a rush to obtain dollars, with the consequence that the dollar reserves of the sterling area would soon have been exhausted. In fact, a premature attempt to establish sterling convertibility in 1947 led to such a drain on reserves that strict exchange controls had to be re-imposed.

Exchange controls on residents can be enforced by requiring that earnings of foreign currencies (*e.g.*, the proceeds from the sale of exports) be handed over to the exchange control authority—the Bank of England acts as the Government's agent—in exchange for sterling; and by permitting the exchange of sterling for foreign currencies (*e.g.*, to enable the purchase of imports) only for transactions approved by the exchange control authority. There was a move towards convertibility of sterling during the 1950s, and the sterling held by non-residents was made fully convertible in 1958. Residents, however, continued to be subject to exchange controls.

By restricting convertibility the Government can make it more difficult for funds to move into or out of sterling. In this way the Government can impede capital movements, *e.g.*, British private investment abroad, or it can restrict current spending abroad, *e.g.*, on foreign holidays.

(iii) Import Controls and Tariffs.

Import controls impose limitations on the quantity or value of goods which are permitted to enter a country; tariffs are duties levied on imported goods so that the price of those goods to consumers in a country is higher than the price received by the foreigners supplying the goods. In the early post-war years, Britain maintained strict import controls over a wide range of goods. These were gradually dismantled, until in 1959 the last remaining import controls on goods were abandoned, except on habit-forming drugs and some agricultural products and textiles from the Far East—to give a measure of protection to British producers.

All countries impose tariffs. Some tariffs are primarily intended to raise revenue for the Government, and others are primarily intended to protect home industries by raising the price of competing goods from abroad. The rights of countries to raise tariffs, or to operate tariffs in a discriminatory way (*i.e.*, to offer lower tariffs on goods from some sources than on similar goods from other sources), are closely circumscribed by the rules of the *General Agreement on Tariffs and Trade* (GATT). The object of the GATT is to work towards free trade, especially through a reduction in tariffs. In the post-war period GATT held several major conferences, at which bargaining to reduce tariffs was attended by modest success. The most significant moves towards free trade in this period were on a regional basis.

The disadvantage of introducing import controls or tariffs to correct a deficit in the balance of payments is that the benefits of free trade are lost. Moreover, there is always the possibility of retaliation by Britain's trading partners. Nevertheless, import controls or tariffs may well be preferable to another measure which has been used to correct a deficit, deflation.

(iv) Deflation.

Throughout the post-war period the U.K. balance of payments was far from secure. As a result, domestic economic policies were much influenced by balance of payments considerations. Devaluation was turned to only as a last resort. The movement in the 1950s and 1960s was towards greater freedom of trade. By ruling out devaluation and trade restrictions, the authorities had to fall back on *deflation* of the economy to correct periodic deficits. In other words, the Government took measures to discourage demand and so cut back incomes and employment. By reducing demand in general, the authorities secured a fall in demand for imports. However, it was necessary to cut back national income by many times the ensuing fall in imports. Deflation is a painful method of correcting a deficit. Not only does it have a direct effect on the level of incomes and employment, but it is also liable to slow down the rate of growth of the economy. This can happen because deflation can weaken the incentive to expand productive capacity by investing in new plant, machinery, and other capital goods.

The problem which faced British policy-makers attempting to raise the rate of economic growth was this: as total demand for goods and services expands, it is difficult to prevent growth in the demand for imports and diversion of exports to the home market, particularly when home industries reach the limit of their productive capacity.

Yet if consequent balance of payments difficulties are met by restrictions on total demand, it is difficult to maintain the investment necessary for growth in the productive capacity of the economy. The main need during the 1970s was the same as that during the 1950s: to achieve an expansion of exports relative to imports so as to secure economic growth without running into balance of payments difficulties.

The international monetary system is partly to blame for the British decisions to resort to periodic deflation of the economy. The use of sterling as a reserve currency has subjected the balance of payments to violent swings in short-term capital flows. Moreover, a world-wide shortage of *international liquidity*, *i.e.*, gold and foreign exchange reserves, means that countries have an incentive to maintain a surplus in their balance of payments and so increase their reserves. In this situation surplus countries do not help to correct an imbalance in foreign transactions: the burden of correcting the imbalance is placed on the deficit country. If the Government of the deficit country feels itself unable to devalue its currency or to impose trade restrictions, it has to deflate the economy. The existing international monetary system contains a " deflationary bias," which the International Monetary Fund (*see below* and G37) has at most only ameliorated.

The International Monetary System.

(i) International Liquidity.

Imbalance in payments between countries is financed by transfers of gold or foreign exchange (*see* G8). These reserves of gold and foreign exchange are known as *international liquidity*. Their basic characteristic is general acceptability: they can perform their function only if they retain the confidence of those engaged in international transactions. Unless it is ultimately convertible into goods and services, gold has merely an industrial and ornamental value. But since most central banks are prepared to buy and sell gold at a fixed price in terms of their local currency, confidence in gold is maintained.

Two *international reserve currencies* have emerged to supplement gold: the pound and the dollar. The pound has performed this function since World War I, but the dollar has become the main reserve currency since World War II. Surplus countries are prepared to hold short-term debt in pounds or dollars—so earning a rate of interest—confident that their future trading deficits can be financed by payment of these currencies or by their conversion into gold. These holdings are known as the *dollar* and *sterling balances*. Like gold, they can perform their function as international reserves only if there is confidence that they can be converted into other currencies and hence into goods and services at current exchange rates. There is one other form of international liquidity—drawing rights on the IMF (*see* G10). Near the end of 1973 gold accounted for 23 per cent of total international liquidity, foreign exchange reserves for 67 per cent, the IMF for 4 per cent, and the newly created Special Drawing Rights (*see* G37) for 6 per cent.

In recent years two developments have undermined the present international monetary system. First, the growth of international trade has outstripped the growth of reserves with which to finance imbalances in this trade. Between 1952 and 1972 world trade, measured in dollars, rose by 375 per cent, whereas international liquidity, measured in dollars, rose by only 175 per cent. Gold reserves have been a declining proportion of international liquidity, partly because gold production has been hampered by the fixed price in the face of rising costs of gold production, and also because an increasing proportion of newly-mined gold has found its way into private speculative hoards and not into official stocks. The other main source of new international liquidity was an increase in dollar balances. By the late 1960s dollar balances actually exceeded the United States gold reserves.

The second problem to have emerged is the weakness in the balance of payments of the reserve currency countries. Both Britain and the United States have had persistent deficits in recent years. As a result there have been periodic fears that the dollar or the pound would be devalued in terms of gold and other currencies; and this has resulted in speculation against the dollar and the pound (*see* G33–4 and 37). The inadequacy of international liquidity and the weakness of the reserve currencies produce a dangerous " deflationary bias " in the world economy.

(ii) The Sterling Balances.

Governments and individuals may hold balances in sterling (*e.g.*, Treasury bills, Government stocks and bank accounts) for many reasons. Sterling area countries reckon to keep a high proportion of their international trade reserves in the form of sterling balances. It is convenient to hold sterling to finance trading transactions because sterling is widely acceptable in settlement of trading debts. Sterling balances will also be held to the extent that they are considered a profitable and safe way of holding liquid assets. It may be profitable to hold sterling if the rate of interest paid on balances in London is higher than that paid in other financial centres. And it may be considered safe to hold sterling if the chances of sterling devaluation (which would automatically reduce the value of the balances in terms of any currency which did not devalue) are thought to be remote.

An increase in the sterling balances enables Britain to finance an adverse balance of payments without reducing the gold and foreign exchange reserves. Conversely, a reduction in sterling balances can impose a drain on reserves even if there is no adverse balance.

At the end of 1970 liquid sterling balances held by non-residents (excluding the International Monetary Fund) amounted to £2,800 million; far in excess of Britain's reserves of gold and convertible currencies, equal to £1,180 million. Nearly threequarters of this amount was held by the rest of the sterling area. However, it is unlikely that Britain would be able to finance a persistent deficit in her balance of payments through a progressive increase in the sterling balances. In the long run the sterling balances will probably be reduced, *e.g.*, many underdeveloped countries of the sterling area will want to run down their sterling balances in order to help finance the imports required for their development programmes, and all sterling area countries have faced the risk of capital loss through sterling devaluation.

Sterling holdings outside the sterling area, and particularly the unofficial (*i.e.*, private) holdings, are highly volatile, in that they may be withdrawn very rapidly if for any reason it is thought less profitable or less safe to hold sterling than some other currency or gold. Since confidence in sterling is weakest (*i.e.*, fear that it will be devalued is greatest) when the balance of payments is in deficit, sterling balances tend to move perversely, so accentuating movement in the reserves. Such was the case, for instance, in the sterling crisis of 1964.

It is ironical that Britain's position as an international currency country makes it more and not less difficult to rely on a running down of reserves to meet a temporary deficit in the balance of payments. However, under the Basle agreement of 1968 the major central banks granted the United Kingdom new credit facilities of up to £800 million for 10 years with which to finance sales of sterling as the sterling balances are run down. Also the British Government guaranteed the value, in terms of U.S. dollars, of most of the official sterling reserves held by sterling area countries, in return for their holding at least a certain proportion of their reserves in sterling. These arrangements help to protect sterling against the dangers of being a reserve currency.

(iii) The International Monetary Fund.

The *International Monetary Fund* (IMF) was set up after the war with the objective of working towards free trade at stable exchange rates. Under the original agreement setting up the Fund, members agreed to make their currencies convertible into other currencies and gold at fixed rates of exchange, and agreed not to impose exchange or import controls without the per-

mission of the Fund. Any alteration in the rates of exchange by more than 10 per cent also requires the permission of the Fund. For many years after the war, the imbalances in world trade—and particularly the acute shortage of dollars—were such that many countries had to invoke the clauses in the agreement which permitted them to impose restrictions during a "transitional" period. During the 1950s the progressive relaxation of exchange and import controls by this country was paralleled in some other countries, and most of the currencies important in world trade and payments were declared convertible.

The function of the Fund is to make foreign exchange resources available to members who run into balance of payments difficulties. Each member country makes a deposit (called its quota) partly in gold and partly in its own currencies, with the Fund. The size of the deposit is fixed in relation to the country's share in world trade. In return, it is granted certain automatic drawing rights, which entitle it to borrow foreign currencies from the Fund. Furthermore, the Fund has power to make larger loans, and to grant stand-by credits to be drawn on if required. Before the Fund will make such loans and credits available, it has to be satisfied that the borrowing country is taking appropriate action to correct the balance of payments disequilibrium.

In 1964 and 1965, when there was a severe deficit in total currency flow and heavy speculation against sterling, the British Government borrowed from the IMF £369 million in 1964 and £499 million in 1965. In this way the country could ride out crises of confidence in sterling without a severe loss of reserves.

For an account of recent international monetary crises and attempts at reform, involving the IMF, see Part IV. G37–8.

(iv) The Eurodollar Market.

The Eurodollar market is a market for bank deposits which are denominated in foreign currencies. It derives its name from the fact that most of the banks which accept these foreign currency deposits are in Europe (including Britain) and most of the deposits are denominated in U.S. dollars. The Eurodollar market has grown at remarkable speed. A phenomenon of the 1960s, the market involved deposits of $9 billion in 1964 and $37 billion in 1969. The reason for that growth was the profitability of Eurodollar transactions. Banks found that, particularly if only large units of money were handled, they could profitably borrow funds in country A and lend in country B, while paying interest rates higher than those paid in country A and charging rates lower than those charged in country B. Its growth was helped by the continuous deficit in the United States balance of payments, since this meant that banks and institutions received dollars which they were willing to hold and lend. London is very important in the Eurodollar market: London banks accounted for no less than 57 per cent of the total external liabilities in U.S. dollars reported by European banks in 1968.

The Eurodollar market—involving great mobility of short-term funds—creates problems for the regulation of economic activity. The market affects the rates of interest and the availability of credit in different countries, and money movements can thwart both restrictive and expansionist monetary policies (*see* G24).

2. EMPLOYMENT, PRODUCTION, AND INDUSTRY

Population.

In June 1970 the population of the United Kingdom was estimated to be 55·7 million—49·0 m. in England and Wales, 5·2 m. in Scotland, and 1·5 m. in Northern Ireland. The total was rising slowly, at a rate of about 0·6 per cent per annum. The *crude birth rate* (the number of live births per 100 people) was about 1·7 in the 1960s, and the *crude death rate* about 1·2; giving a *rate of natural increase* of 0·5 per cent. Net immigration was slightly positive, but became negative in the last three years of the decade.

The official estimate of the population of the United Kingdom in the year 2001 is 66·5 million. But prediction of future trends is difficult. For instance, it depends on immigration and emigration policies, the effect of improving medical services on the average length of life, trends in the age at which people marry, advances in techniques of birth control, and attitudes towards desirable family size. The average age of women on first marriage fell between 1951 and 1969 from 24·6 to 22·7 years. The expectation of life at birth was 66·2 years in 1951 and 67·9 years in 1969 in the case of males; being 71·2 years in 1951 and 73·5 years in 1969 in the case of females.

It is sometimes said that Britain is an overpopulated island. However, the apparent increase in overcrowding may be more the result of increasing prosperity, *e.g.*, the impact of the motor car on our environment, than of increasing population.

The Population of Working Age.

Of the total population only some are of *working age*, *i.e.*, between the minimum school leaving age of 15 (becoming 16 in 1973) and retiring age—65 years for men and 60 for women. Of course, not all those of working age do work and not all those above working age have retired; nevertheless, the ratio between population not of working age and the total is a useful statistic, as it does provide a rough guide to the numbers who have to be supported out of the national income but who do not contribute to it. This ratio was 40 per cent in 1970; 24 per cent being below working age and 16 per cent above. It is likely to rise over time as people live longer and particularly if the age of retirement is reduced.

The Labour Force.

Not all persons of working age actually work, although the vast majority do; but only a part are gainfully employed, *i.e.*, work for wages, salaries, or profits. It is only those *gainfully employed* who are counted in the *labour force* (or working population), *e.g.*, housewives and mothers are excluded unless they do some work for cash. In 1970, when the total population of the United Kingdom was 55·7 million, of whom

DISTRIBUTION OF WORKING POPULATION, UNITED KINGDOM, JUNE 1970
(Thousands)

Primary Industries:	
Agriculture, forestry, and fishing	380
Mining and quarrying	418
TOTAL	798
Production Industries:	
Construction	1,367
Gas, electricity, and water	391
Transport and communication	1,591
Manufacturing	8,911
of which:	
food, drink, and tobacco	891
chemicals and allied industries	475
metal manufacture	592
engineering	2,283
shipbuilding	199
vehicles	842
textiles	716
clothing and footwear	501
paper, printing, and publishing	655
other manufacturing	1,757
TOTAL	11,086
Services:	
Distributive trades	2,706
Financial, business, professional and scientific services	3,851
Catering, hotels, etc.	577
Miscellaneous services	1,268
National government service	573
Local government service	858
TOTAL	9,833
GRAND TOTAL	21,717

33·5 million were of working age, the total labour force (including the unemployed who are seeking employment) was only 25·6 million. Of the 16·0 million women of working age only 9·2 million were gainfully employed. So for every person who was gainfully employed there was just over one other person to be supported. One feature of the post-war years was a steady increase in the proportion of adults going out to work. Whereas in 1955, 66 per cent of the working-age population was gainfully employed, in 1970 the figure was 77 per cent.

Most of the labour force work for wages and salaries as employees. Of the total for the United Kingdom in June 1970 of 25·6 million, 1·8 m. were employers or self-employed, 0·37 m. were in the Forces, 22·9 m. were employees and 0·55 m. were registered as unemployed.

The table shows the industries in which people work. Some 7 per cent of the total work in the *primary sector* (agriculture and mining) and 49 per cent in the *production industries*, 39 per cent being in manufacturing (the main production industry). As an economy develops there is a tendency for employment in the primary sector to decline at the expense of the production industries. At high levels of income a large proportion of income is spent on services, and employment in services expands as a proportion of the total. Thus, in 1955 services accounted for only 36 per cent of total employment; whereas by 1970 the proportion had risen to 43 per cent.

Employment and Unemployment.

In 1970 an average of 603,000 persons—2·6 per cent of the labour force—were unemployed in Great Britain. In most post-war years the average was lower than 1.5 per cent. Even in January 1959, the worst month of the 1950s, the rate rose only to 2·8 per cent, and in February 1963—an exceptional month owing to weather—to 3·9 per cent. These contrast with an average figure in 1937, the best year of the 1930s, of 11 per cent, and with a figure of 22 per cent at the bottom of the slump in 1932. The low unemployment of the post-war years was not maintained in the late 1960s. Unemployment grew and in 1971 averaged 3·6 per cent. In January 1972 unemployment had reached the remarkable level of 1,000,000 unemployed—no less than 4·0 per cent of the labour force.

UNEMPLOYMENT AND VACANCIES
(Great Britain, thousands)

	Unemployment. (Annual average.)	Vacancies. (End of period.)	Unemployment as percentage of total employees.
1932*	2,829	n.a.	*22·1*
1937*	1,482	n.a.	*10·9*
1956	257	279	*1·2*
1958	457	163	*2·1*
1960	360	294	*1·6*
1962	463	157	*2·0*
1964	381	311	*1·6*
1966	360	234	*1·5*
1968	564	267	*2·4*
1970	603	211	*2·6*
1972	844	225	*3·7*

* Figures relate only to population insured against unemployment.

Probably 1–1·5 per cent unemployment is somewhere near the practicable minimum; for some unemployment is more or less inevitable. Some seasonal rise in unemployment in the winter must be expected, *e.g.*, in seaside towns, and for this reason unemployment in January is half a per cent or so higher than in June. Moreover, some unemployment is bound to be involved in job-changing and as the demands of industries change. "Full employment" means that there should be about as many jobs vacant as there are workers looking for jobs. A large excess of vacancies is evidence of inflationary pressure in the labour market, for it means that the employers needing workers to meet the demands for their products will have to compete with each other by bidding up wages.

To some extent unemployment figures are misleading, as not all unemployed workers are eligible for unemployment benefit under the National Insurance Scheme. Most married women who go out to work normally opt not to pay the full National Insurance contributions, so that, when they become unemployed, they just drop out of the "working population." Unemployment figures definitely understate the seriousness of recessions, as they do not count all the persons who would like to have, but cannot find, jobs.

Of the 603,000 persons on average unemployed in 1970, 514,000 were men and 89,000 were women. Only a few—23,000—were temporarily stopped, 580,000 being wholly unemployed. Of these 102,000 were unemployed for 2 weeks or less, 143,000 for between 2 and 8 weeks, and no less than 335,000 were unemployed for more than 8 weeks.

Regional Unemployment.

A peculiarly dreadful feature of the inter-war years was the emergence of the depressed areas—the regions of the country where a third of the men had not had a job for a year or more. Such extreme regional unemployment has not recurred in the post-war period: only in Northern Ireland was unemployment very high. Between 1954 and 1970 unemployment there ranged between 6 and 10 per cent. Nevertheless, regional inequalities exist.

PERCENTAGE OF WORKERS UNEMPLOYED, BY REGIONS

	Annual average 1965	November 1971
North	2·6	6·4
Yorkshire and Humberside	1·1	4·5
East Midlands	0·9	3·3
East Anglia	1·3	3·3
South East	0·9	2·2
South West	1·6	4·0
Wales	2·6	5·2
West Midlands	0·9	5·5
North West	1·6	4·7
Scotland	3·0	6·6
Great Britain	*1·4*	*4·0*
Northern Ireland	6·1	8·4

In November 1971 the proportion of all workers unemployed in Great Britain was 4·0. But the table shows a lower proportion was unemployed in the South East, East Anglia, and East Midlands, and that there was a much higher proportion unemployed in the north and west of England, in Wales, Scotland, and Northern Ireland. Moreover, the labour shortage of 1965 was not shared equally: unemployment remained above 2·5 per cent in the North, Wales, Scotland, and Northern Ireland. In this situation checks have to be placed on the economy before full employment is reached, because in the booming areas vacancies far exceed unemployment.

DECREASE IN EMPLOYMENT IN SELECTED INDUSTRIES, 1950–1970

	Thousands.	Per cent.
Textiles	373	34
Mining and quarrying	446	48
Shipbuilding	118	37
Agriculture, forestry, and fishing	457	55

One of the main reasons for the regional pattern of unemployment is that certain industries and services, in which big changes have been taking place, tend to be grouped in specific

regions. Most of our early industrial centres had to be established close to coal, iron ore, and adequate water supplies. But employment in many long-established industries has recently been declining. The scale of this contraction can be seen from the table. On the other hand new and growing industries, and their related offices, have been concentrated in Greater London, the South East, and the Midlands. The growth of services, too, has centred on the areas where industry is booming and population is increasing. In the absence of government intervention, the process would tend to become cumulative, and regional inequalities would grow rather than diminish.

National Income.

Gross domestic income (GDY) is the sum total of incomes received for the services of labour, land, or capital in a country. Gross domestic product (GDP) is the money value of all the goods and services produced in the country. So as to avoid double-counting, only the *value added* at each stage of production is included: firms' purchases of goods and services from other firms are excluded. The revenue from selling the GDP is either paid out to the hired factors of production—labour, land, and capital—or retained in the form of profits. Therefore, provided it is calculated net of taxes on goods produced, GDP must equal GDY. To estimate gross national income (GNY) from GDY it is necessary to add the net income—such as profits and interest—received from abroad. If an allowance is made for wear and tear of the nation's capital equipment, *i.e.*, for *capital consumption*, we arrive at net national income, better known as the *national income*.

In 1970 the national income of the United Kingdom was £38,687 million, implying a national income per head of £694. In 1955 the corresponding figures had been £15,525 million and £305 per head. However, only part of the increase in value was due to an increase in the quantity of goods and services produced; some of the increase simply reflected a rise in prices. It is important to calculate changes in the volume of output—known as *real output*—as well as changes in its value. Real output is calculated by the statistical device of constructing an index number. This is done by calculating the volume of goods and services provided in each year and then valuing these goods and services at the prices found in one particular year. Thus between 1955 and 1970 the money value of national income rose by 149 per cent, whereas real income increased by only 44 per cent, and the difference represented a rise in prices.

The Quality of Life.

In real terms national income per head rose by 32 per cent between 1955 and 1970, or by 1·2 per cent per annum. National income per head is the most useful indicator of the standard of living. However, this measure is necessarily a crude one. For instance, it cannot take into account new and better products, *e.g.*, television, man-made fibres, faster flight, long-playing records, or the lowly plastic bucket; nor does it indicate changes in the distribution of income between rich and poor; nor in the length of working week.

Data of national income per head may also conceal important changes in the "quality of life", *e.g.*, in our physical environment. This is affected by such things as traffic congestion, noise, water- and air-pollution. Between 1960 and 1970 the number of cars on British roads more than doubled, from 5·5 million to 11·5 million; the number of road goods vehicles with unladen weight exceeding 8 tons growing fivefold over the same decade. Movement of civil aircraft over Britain doubled during the 1960s, and aircraft tended to become noisier. On the other hand, air in London has become cleaner: in the period 1949–54 there were on average 1·29 hours of winter sunshine per day, whereas in the period 1964–69 the average was 1·66 hours.

Industrial Production.

It is fairly easy to measure output in the main manufacturing industries, and in many of the other industries producing goods. It is much more difficult to do so for the service industries: the output of a doctor or a teacher is not easily measured. So each month the Central Statistical Office calculates the *index of industrial production* covering the main production industries. Industrial production is thus an early indicator of economic trends (*see* G40), but it is prone to fluctuate more than do the other components of GDP.

Manufacturing industry accounts for more than three-quarters of industrial production. Within manufacturing industry two industries have expanded most rapidly—chemicals, which includes drugs, plastics, cosmetics, detergents, and oil refining; and engineering, which includes electronics, machinery, and domestic appliances. The slowest growing manufacturing industries are textiles and shipbuilding, which are losing their markets to cheaper competitors. Those industries in which demand has stagnated tend to be the industries in which output per employee, *i.e.*, productivity, has stagnated.

International Comparisons.

Between 1955 and 1964 Britain's GDP grew less rapidly than that of any other country listed in the table, except the U.S.A. The British economy was also characterised by a relatively slow growth of output per head, *i.e.*, productivity. Many explanations of Britain's poor performance have been suggested, and there is by no means agreement on this matter among economists. It has been argued that the U.K.—like the U.S.A.—has a highly advanced economy, in which there is a relatively high demand for services; and that it is difficult to raise productivity in the large services sector. Another argument is that Britain has been hampered by its slowly growing labour force, which has restricted growth not only in output but also in output per man. The reason given is that an expanding labour force needs to be equipped with additional plant and machinery; so that its capital equipment tends to be newer on average than that used by a static labour force, and thus more up-to-date and efficient.

Some commentators have put the blame on the inefficiency of our business management; some on our educational system, biased towards the humanities; some on the social milieu which looks down on money-making as a career; some

AN INTERNATIONAL GROWTH LEAGUE TABLE

	Percentage change per annum, 1955–64.			Investment as percentage of G.N.P.	
	Output.	Employment.	Output per head.	Including dwellings.	Excluding dwellings.
Japan	10·4	1·4	8·8	28·8	21·5
W. Germany	6·3	1·3	5·0	23·7	18·4
Italy	5·7	0·1	5·6	21·6	15·6
Sweden	5·4	1·5	3·9	22·8	17·4
France	5·2	0·3	4·9	19·2	14·3
Denmark	5·0	1·2	3·8	18·7	15·4
Belgium	3·6	0·6	3·0	18·4	13·7
U.S.A.	3·1	1·1	2·0	17·1	12·2
U.K.	3·1	0·5	2·6	15·8	12·7

on over-manning and other restrictive practices of trade unions. A good deal of attention has also been paid to the proportion of output which different countries devote to *investment*, *i.e.*, expenditure on commodities—such as plant and machinery—for use in future production. These investment ratios are shown in the table. With the exception of the U.S.A., all countries have investment ratios considerably higher than in the U.K., with correspondingly higher growth rates of output and productivity. Since investment in dwellings contributes very little to growth, it is appropriate to exclude this investment: however, the same results are obtained. This leads to the hypothesis that Britain's growth rate could be raised if a higher proportion of output were devoted to investment, particularly in plant and machinery. There is probably some truth in many of these explanations, and it is unlikely that any one remedy will be sufficient to raise the British growth rate.

Investment.

In 1970 gross investment in capital assets amounted to £8,886 million in the United Kingdom. This was about 21 per cent of the GNP. The net addition to the nation's stock of capital assets was just over half of total investment, and just under half the total was needed to offset the wastage of assets already in use, *i.e.*, to make good the *capital consumption*.

There are four main kinds of investment: plant and machinery, vehicles, dwellings, and other construction. In 1970 the four categories accounted for 39, 11, 17, and 33 per cent respectively. Investment may also be analysed by the purpose for which it is used. Social services such as education and health (7 per cent) take a surprisingly small proportion of total investment. Distribution and other service industries (16 per cent) and public utilities (18 per cent) take a large proportion: investment in electricity alone accounts for over 5 per cent of the total. It is clear that some sectors of the economy are more capital-intensive than others. Manufacturing investment accounts for 24 per cent of the total. This is small in relation to the contribution of manufacturing to ouput. However, many of the fast-growing manufacturing industries—*e.g.*, chemicals, electronics, steel—use much machinery and equipment per unit of output produced. These capital-intensive plants cannot pay unless they are worked at near full capacity. With the growing capitalisation of industry it is increasingly necessary to introduce shift work.

Increasing Investment.

The proportion of total output invested—the *investment ratio*—is lower in Britain than in other countries with faster growth rates of output and productivity; and there is reason to believe that a higher proportion would improve the growth rate to some extent (*see* G12). But in a fully employed economy it is not possible to increase investment expenditures without curtailing other forms of expenditure, notably private and public consumption. This curtailment would have to be brought about by increasing taxation or encouraging people to save or by pruning public services. Yet the very act of restricting private consumption may induce private firms to *reduce* their investment expenditures.

In 1970, 55 per cent of total investment in the United Kingdom was carried out in the private sector, 27 per cent by public authorities and 18 per cent by the public corporations. The Government has more control over investment in the public sector than in the private sector. Governments do possess various policy measures by which to influence private investment (*see* G21–5, 40–3) but private investment is volatile and highly dependent on businessmen's expectations, especially their expectations about the future growth of their markets. It is no easy matter to raise the British investment ratio.

If a higher investment ratio could be achieved, a faster rate of economic growth—and therefore higher consumption in the future—would involve a sacrifice in current consumption. A choice must be made between the loss in current consumption and the ensuing gain in future consumption. Of course not all consumption expenditure is equally important to the standard of living: some would argue that if British defence expenditure was pruned to permit more investment, there would be no loss to set against the future gain.

The Finance of Investment.

Any business is allowed to charge as a cost the depreciation of its assets. Normal depreciation allowances are based on the original cost of the asset and on its expected useful life. In a time of price inflation depreciation allowances will not provide sufficient finance to permit the replacement of assets at higher prices, and there are many supporters of depreciation allowances being based on replacement costs. Many firms do set aside extra funds specifically to cover these extra replacement costs.

Governments have, however, adopted certain fiscal devices to encourage replacement and net investment. Soon after the war initial allowances were introduced. Under this system firms were permitted to charge against profits in the first year of its life 20, or at times 40, per cent of the cost of any new equipment, and the system amounted to a loan of the tax saved in the first year, repaid over the life of the asset. In 1954 initial allowances for machinery were replaced by a system of investment allowances, under which a firm could charge against profits 20 per cent of the cost of any new machine, with the difference that all ordinary depreciation allowances were still chargeable. So the investment allowance was a grant, not a loan, of the saved tax. In 1966, initial and investment allowances on new plant and machinery in three sectors—manufacturing, mining, and shipping—were replaced by cash grants. Other plant and machinery and industrial building received higher initial allowances. In 1970 the Conservative Government reintroduced initial allowances in place of investment grants but in 1972 tried to encourage investment by granting free depreciation (*see* G43).

Depreciation allowances and government allowances and grants for investment are sufficient to cover more than half of investment (excluding dwellings) by the private sector, and to cover a minor part of public (non-housing) investment. The residue of investment, and housebuilding, has to be provided from other sources of funds. Companies rely mainly on retained profits, which are often larger, taking companies as a whole, than their net investment. Other sources of company finance are borrowing in financial markets and the issue of company shares (*see* G23). Much public investment must be financed by the Treasury (*see* G22).

Automation.

Accompanying the accumulation of capital is a tendency towards automation in production. With automation, much of the manual semi-skilled work should come to an end. Electronic computers are able to control the machines that actually do the manufacturing operations. " Transfer " machines can read details of the work to be done off a piece of tape; they can adjust themselves to correct mistakes or to adjust for faulty materials.

So far the impact of automation has been small. The main use has been in the office, where computers can carry out far more efficiently much of the routine calculating, recording, and checking operations previously done by clerks. But it will continue to spread, and must do so if the growth in incomes is to continue. The change will come only gradually. But ultimately one can envisage that both in manufacturing industry and in office work the machine will have replaced much of the human effort in work, and even more of its drudgery. The typical manual job will become that of the skilled maintenance man.

This revolution will take many decades to effect. It raises no spectre of widespread redundancy; but it does mean that over the years more and more emphasis will need to be laid on the training of workers for skilled work, and indeed on raising the general level of education.

Also over the years the average size of factory is likely to grow as these new methods, if they are to be profitable, have to be used on a large scale.

Monopoly and Competition.

This trend to increasing size and increasing capitalisation has been going on now for many decades, and in the process it has changed the face of British industry. In the early 19th cent. the typical firm was the owner-managed textile mill. Then in the 1860s and 1870s came the discovery of cheap methods of making steel, with the consequential immense growth in the engineering industries. Most of the chemical industry is still newer, and there are a number of entirely 20th cent. industries such as aircraft and electronics.

In the capital-intensive industries the big firm predominates. In some it has become almost a monopoly; in others the pattern is of a few firms, all large. In 1970 the top British companies —each with sales exceeding £1,000 million— included oil firms (British Petroleum and Shell), tobacco firms (British American Tobacco and Imperial Tobacco), chemical firms (Imperial Chemical Industries and Unilever) and one in the motor industry (British Leyland Motor Corporation). There is evidence that the extent of *concentration* of British industry—according to measures such as the proportion of the output of an industry produced by the largest three firms—has increased steadily since 1945.

Competition goes on, but it has changed its form. In the old days competition was largely by price. Now it is largely by advertising and by variations in the quality and other features of the product—detergents and motor cars being good examples. In many industries groups of firms producing similar products entered into agreements which had the effect of restricting competition, for example through schemes for price-fixing.

Regulation of Monopoly and Competition.

(i) Restrictive Practices Court.

The Restrictive Practices Act of 1956 outlawed many of the main forms of restrictive agreements to prevent competition. Collective price fixing was declared to be illegal unless the industry could show that the practice brought substantial benefit to the public. Collective price-fixing was the system under which a central association for the industry lays down minimum prices at which members may sell. Usually such a system was backed by arrangements for collective boycotts, under which members of the association would refuse to sell goods to wholesalers or retailers who broke the rules. Collective boycotts were also found in industries without collective price-fixing, one common purpose being to make sure that retailers did not sell a manufacturer's products below his recommended price. This form of collective resale price maintenance was also outlawed by the Act.

Under the Act any restrictive agreements of several specified kinds have to be registered with the Registrar of Restrictive Practices. He then has to decide whether there is a *prima facie* case for the discontinuation of the agreement, and, if he thinks there is, the case is referred to a Restrictive Practices Court, containing both judicial and lay members. For an agreement to be upheld, the agreeing parties have to prove to the Court that the agreement confers some substantial benefit on the public which outweighs any injury it does to the public.

(iii) Resale Prices Act.

The Act of 1956 permitted individual manufacturers to enforce *resale price maintenance* (r.p.m.) for their own products. Few suppliers would want the publicity of enforcing r.p.m. through the courts, but individual suppliers could still put some commercial pressure on price-cutters, *e.g.*, by offering less favourable terms or by refusing them supplies. The Resale Prices Act of 1964 prohibited all methods of enforcing minimum resale prices. However, goods which had been registered in due time with the Registrar of restrictive trading agreements or have been approved by the Restrictive Practices Court, were exempted, temporarily in the former case and permanently in the latter. For r.p.m. to be approved by the Court, it must be shown that some ensuing benefit to customers (*e.g.*, of increased quality or more retail outlets) outweighs any detriment. It is also lawful to withhold supplies to retailers selling goods at a loss to attract customers.

As a result of the Act r.p.m. has ceased to be a common practice in the United Kingdom, and prices in the shops are lower than they would otherwise be. The Act also means a more rapid decline of small retailers.

(iii) The Monopolies Commission.

The Restrictive Practices Acts leave untouched the industries in which one firm is dominant: these remain the responsibility of the Monopolies Commission. This is an independent administrative tribunal, established in 1948, with powers to investigate and decide whether a monopoly (defined in terms of market share) is contrary to the "public interest." The Commission reports on industries referred to it by the Department of Trade and Industry (formerly the Board of Trade) and makes recommendations.

The Monopolies and Mergers Act of 1965 strengthened control over monopolies and mergers. With regard to monopolies, the Government wished to provide itself with legal powers of enforcement: previously monopolies had been expected to comply voluntarily with the findings of the Monopolies Commission. The Act also permits the Government to refer a merger or a proposed merger to the Monopolies Commission in cases where the merger would lead to monopoly (defined as control of at least one third of the market) or would increase the power of an existing monopoly, or where the value of the assets taken over exceeds £5 million.

In interpreting the public interest, the Monopolies Commission has criticised monopolies for various practices, *e.g.*, if they attempt to deter entry to the industry, or earn abnormally high profit rates, or show weakness in research and innovation.

(iv) The Industrial Reorganisation Corporation.

Mergers may lead to monopoly and to the abuse of monopoly power. But it would be wrong to presume that mergers are always bad: mergers—by facilitating research and other economies of large-scale production—may increase industrial efficiency. For this reason the *Industrial Reorganisation Corporation* (IRC) was set up in December 1966 under Government auspices. Its functions were to promote industrial reorganisation in the interests of industrial efficiency, *e.g.*, by enabling industries to achieve economies of scale or by reorganising inefficiently managed firms. It assisted firms in agreed regroupings and could intervene to encourage a particular takeover which, in its estimation, was in the public interest.

The IRC Act provided the Corporation with financial resources of up to £150 million. However its objective in making loans was to "prod" and not to "prop" inefficient firms. It supported mergers in electronics, trawling, nuclear power, mechanical engineering, and other industries. In 1970 the incoming Conservative Government decided to wind up the IRC.

(v) Restrictive Labour Practices.

Restrictive labour practices—which result in the "over-manning" of plant or the "underemployment" of men—are common in British industry. These stem from such causes as the fear of redundancy and unemployment, anxiety to preserve a craft skill threatened by technical progress, the desire to work at overtime rates, and sometimes just inertia. Governments have made attempts to eliminate this underemployment. In its incomes policy the Labour Government specifically made *productivity agreements*—agreements to change working practices in return for higher pay—an exception to the norm laid down for wage increases (*see* G47). One of

the objectives of the Conservative Government taking office in 1970, in condoning and maintaining the recession in the economy, was to achieve a "shakeout" of underemployed labour. The permanent elimination of restrictive labour practices requires more enlightened management, more union co-operation, and more Government measures to promote the mobility of labour between occupations.

Nationalised Industries.

Nationalised industry accounts for about 10 per cent of British production. Local authorities also run some services, *e.g.*, bus transport and water provision. In many cases—*e.g.*, the railways, gas, electricity, and postal services—these industries are natural monopolies, in which the provision of competing services would obviously be wasteful. They were thus obvious candidates for public ownership. With the exception of steel—nationalised 1951–3 and renationalised in 1967—nationalisation has not been extended into manufacturing industry, not even where the existence of private monopoly might suggest there was a strong case. But nationalised industries are not free from competition. The railways face competition from road transport, most of it privately owned; the fuel industries compete with each other, and with the privately owned oil industry.

The nationalised industries are required normally to cover their costs, and to earn a target rate of return on their investment. However, it is government policy that subsidies can be made for some services which are justified on social grounds, *e.g.*, grants are made to British Rail to continue unremunerative rail services. Cross-subsidisation of non-commercial services by commercial services within a nationalised industry is discouraged, and costing according to the *marginal cost* of a service is encouraged. To give an example of marginal costing: once all the gas production equipment and gas pipes have been installed the cost incurred in supplying additional gas is low; thus consumers are charged a low price per unit of gas consumed and, to avoid a financial loss, the Gas Boards make a standing charge to cover overheads.

The nationalised industries are voracious users of capital, as they are nearly all highly-capitalised industries (*see* G13). Until 1956 they raised new capital, when they wanted it, by borrowing on the Stock Exchange; this fixed interest stock being guaranteed by the Treasury. Since then the nationalised industries have drawn directly on the Exchequer for their capital. This system has been criticised. The advocates of equity issue have pointed to the strain it puts on the Exchequer, and the possibility of nationalised industries cutting investment when surpluses fall or become deficits because of the ensuing difficulties in meeting interest obligations. It is also said that nationalised industries have suffered from their dependence on the Exchequer. In times of balance of payments crises the nationalised industries have been forced by the Government to cut back their planned expansion, sometimes at serious cost of disorganisation. But any alternative system of financing would also be open to criticism.

3. INCOMES, WAGES AND PRICES

Personal Income.

National income is a measure of the total income accruing to the residents in a country in return for services rendered (*see* G12). It therefore consists of the sum of wages, salaries, profits, and rents. But not all this income accrues to persons, *e.g.*, companies do not distribute all their profits to shareholders and some nationalised industries earn profits. This is part of national income but not of *personal income*. On the other hand, some personal incomes are not payments for services rendered. Such incomes are called *transfer incomes* to emphasise that their payment does not add to the national income, but only transfers income from one recipient to another. Included in this category are retirement pensions, family allowances, and student grants. In the United Kingdom in 1971 income accruing to companies and public corporations and not distributed exceeded £6,000 million, but the central and local governments made transfer payments of nearly £5 000 million to the personal sector; so that personal income (£47,000 million) was only slightly less than gross national income (£48,200 million).

Personal Disposable Income.

Not all personal income is available for spending. In 1971 the State took 14 per cent of personal income in *direct taxation*, *i.e.*, income tax and surtax; and 6 per cent went as National Insurance contributions, which being compulsory are in effect a form of tax. The remaining 80 per cent of personal income—called *personal disposable income*—was available for spending. However, not all disposable income need be spent on consumer goods and services: income can instead be saved. There are many possible motives for saving, *e.g.*, to meet future contingencies, for a future purchase such as a house or car, for retirement, or for the income to be derived from saving. Saving as a fraction of personal disposable income in Britain is fairly steady at between 7 and 9 per cent.

Types of Personal Income.

Compare the sources of personal income in Britain in 1938 and in 1971. We see in the table that the share of income from employment increased considerably, especially that of wages and salaries. The share of salaries grew relative to that of wages, not because average salaries rose faster than average wages but because the number of salaried workers expanded rapidly. With the development of the Welfare State there was an increase in the percentage of incomes derived from public grants—pensions, social security payments, student grants, etc.

SOURCES OF PERSONAL INCOME, 1938 AND 1971
(As percentage of total)

	1938	1971
Income from employment	*59·5*	*71·1*
of which:		
wages and salaries	55·5	63·2
Forces' pay	1·5	1·5
employers' contributions*	2·5	6·3
Income from self-employment	*12·5*	*8·4*
of which:		
professional persons	2·0	1·5
farmers	1·5	1·8
others	9·0	5·1
Income from property	*22·5*	*10·3*
Grants from public authorities	*5·5*	*10·2*

* To National Insurance and other superannuation schemes.

The types of income which fell as a percentage of the total are incomes of self-employed persons—a diminishing group—and incomes from property. During the war and for several years afterwards property incomes changed little—the effects of rent control, excess profits tax, and low interest rates were such that these incomes did not rise, while other incomes increased sharply. Subsequently there was a rise, as rent control on some property was lifted (*see* D51) and as interest rates increased. In the latter part of the 1960s there was a growing recession in the economy. There was also an acceleration in the rate of wage increases but often prices could not be raised correspondingly because of the need to keep British products competitive with those of other countries. These developments contributed to a squeezing of the share of profits in national income. We see that the share of property incomes (profits, interest, and rents) in 1971 was less than half of what it had been in 1938. Over this third of a century there was a fundamental redistribution of income away from property-owners towards employees.

BRITISH INCOMES BY SIZE, 1968/69

Range of incomes before tax.	As percentage of total.			Rate of tax as percentage.
	Number of incomes.	Incomes before tax.	Incomes after tax.	
–£499	13·0	4·1	4·8	3·4
£500–999	32·9	20·0	21·5	9·7
£1000–1499	29·2	29·4	30·6	12·6

£3000–4999	2·0	6·0	5·2	26·7
£5000–9999	0·8	4·2	3·2	36·3
£10,000–19,999	0·2	1·8	1·0	53·5
£20,000–	0·03	0·8	0·2	74·8
Total . . .	22·188m	£27,221m	£22,851m	16·1

Inequality of Income.

In the tax-year 1968/69 nearly half of income-receivers had incomes under £1,000 and three-quarters under £1,500. The richest quarter received 48 per cent of total income, the richest 9 per cent received 24 per cent, and the top 1 per cent received 7 per cent of the total. Thus Britain is far from being an egalitarian society. Income is still unevenly distributed, but not so unevenly as before the war, when the top 1 per cent received 16 per cent of total income.

WEALTH OF INDIVIDUALS IN BRITAIN
1969

Range of net wealth. (£000)	As percentage of total.	
	Number of cases.	Value of wealth (£m).
0·9	25·9	2·6
1–2·9	31·5	10·7
3–4·9	17·2	12·8
5–9·9	16·1	22·4
10–14·9	3·8	8·6
15–19·9	1·7	5·6
20–24·9	1·0	4·3
25–49·9	1·8	11·5
50–99·9	0·7	8·6
100–199·9	0·2	5·4
200–	0·1	7·4
Total	18·168m	£91,400m

Taxes on income are of course highly progressive, rising sharply as income increases. Those with no incomes pay no income tax, and in so far as they are pensioners, no compulsory contributions either. We see from the table that the proportion of income paid in direct taxes is under 4 per cent on incomes under £1,000 per annum, is 20 per cent in the income range £2,000–2,999, and exceeds 50 per cent on incomes over £10,000.

This tax burden somewhat changes the distribution of incomes. After tax the top 9 per cent received 20 per cent of income and the top 1 per cent 4·4 per cent. But the redistributive effect of taxation must not be overstressed: the levelling of incomes before tax has been of greater importance in making Britain rather more egalitarian than has been taxation policy.

Income and Spending Power.

In various ways figures for incomes alone underestimate the degree of inequality in British society. First, incomes are incomes as defined for income tax purposes. Any allowed expenses are excluded; and for the self-employed and the higher ranks of management the expense allowance now adds substantially to spending power. Second, if one buys an asset which then rises in value one gains extra spending power. Such capital gains can be very important to the wealthy in periods of boom in ordinary share prices, land prices and house prices—as experienced in Britain in the 1950s and 1960s. Yet only in 1965 did capital gains become taxable, and even then the rate of tax on capital gains was low in relation to the rate on additional income (*see* G49).

Inequality of Wealth.

Spending power depends not only on income and capital gains but also on the sheer amount of capital owned. Data on the ownership of capital in Britain have to be estimated indirectly from information arising in connection with the payment of death duties, and therefore cannot be relied upon. However, it appears from the table that individuals owning more than £5,000—just over a quarter of all individuals—owned three quarters of total wealth in 1969, while the richest 1 per cent owned 21 per cent of the total. And this in spite of a growing tendency for the rich to pass on their capital before death to avoid death duties (so distorting the statistics). The vast majority own very little, and Britain is still far from being a property-owning democracy. There is a natural tendency for the inequality of wealth to grow because the higher income groups tend to save a higher proportion of their income, and so to accumulate capital more readily. The Government by imposing estate duties has had to neutralise this tendency. There is some evidence that in the last decade the inequality of wealth has been reduced. Between 1961 and 1971 the share of the wealthiest 1 per cent fell from 28 to 20 per cent of total wealth, and that of the wealthiest 25 per cent from 79 to 72 per cent.

Wages and Salaries.

In 1971 no less than 63 per cent of personal income was paid in the form of wages and salaries. The distinction between the two is very much a matter of convention; many salary-earners now earn less than wage-earners, and a more important division is between those salary-earners who are paid monthly and the rest. Even though weekly-paid staff do not now earn more than wage-earners, they may still in effect be better off; for they generally work shorter hours, are more likely to be covered by private superannuation schemes, and usually work in better conditions. The table shows the earnings of manual and non-manual workers.

GROSS WEEKLY EARNINGS,
GREAT BRITAIN
(Median earnings, adults, 1972)

	Manual	Non-Manual
Men . . .	£31·3	£38·5
Women . . .	£16·4	£20·1

Earnings by Occupation.

Different occupations command different pay, as the table shows. The figures are of *median* earnings, *i.e.*, the earnings of the middle worker within each occupation when workers are arranged in descending order of pay. The structure of pay reflects in part the amount of responsibility which the different jobs entail. The differentials reflect

MEDIAN GROSS WEEKLY EARNINGS OF FULL-TIME ADULT MALE EMPLOYEES, BY SELECTED OCCUPATION, APRIL 1973.

	£ per week
General manager	78·5

General farmworker	23·9
Total workers	*38·4*
of which: manual	*36·6*
non-manual	*42·8*

also the ease of entry into various occupations. This in turn depends on the degree of specialised knowledge, skill or talent required, and in a few cases it depends on the extent to which artificial barriers to entry have created scarcity. The structure of pay is also influenced, of course, by the degree of organisation and bargaining strength of workers in different occupations.

Within the manual occupations the difference between skilled, semi-skilled and unskilled pay is now small. There has been a narrowing over the years. This was most marked during the war and in the years immediately after the war, when skilled workers were granted the same flat rate advances as unskilled.

Occupational differentials have been a major source of industrial strife in some industries. In engineering, for instance, there has been continued conflict between unions with membership largely among the skilled and those with membership largely among the less skilled, over what forms demands for wage increases should take. On the railways there has been similar strife. Because of the importance placed on occupational differentials in collective bargaining there exist powerful rigidities in the structure of earnings in Britain.

Earnings by Industry.

Even within the manual occupations there are significant differences in earnings among industries. These are associated with the bargaining strength of different groups of workers, with the prosperity of the industry, and with the average skill levels required in production. Manufacturing industries pay well; and within manufacturing, car workers and printers receive the highest weekly wages. Public administration (including local government road-men and the like) is a low-wage sector.

Earnings by Sex.

The table also shows very significant earnings differences within each industry between men and women: for industry as a whole the earnings of women in manual occupations are less than half those of men. Often the difference arises because men and women do different jobs, but in some cases there is different pay even in the same job. For women the best paying industry is the buses where there is equal pay for male and female conductors. But in the occupation "semi-skilled assembler" in the engineering industry, for instance, women receive about half the earnings of men. Only a small part of the difference can be explained in terms of the amount of overtime worked.

Overtime and Short-time.

The earnings of any individual worker depend on many factors, and are usually well above the basic wage rate payable for a *standard working-week*. They include overtime earnings; and overtime working is common for men. In most weeks about 2 million operatives in manufacturing—about a third of the total—will be working overtime to the extent of 8 to 9 hours. Even in 1971—a year of high unemployment—the average amount of overtime worked by full-time male manual employees over all industries was 6 hours per employee (including those who worked none); with the average standard working-week being 40 hours, the average hours actually worked were therefore 46. In the transport industry the average working-week for men was as much as 52 hours. The average working week has fallen very little since before the war, although the standard week has been significantly reduced. In

AVERAGE WEEKLY EARNINGS OF MANUAL WORKERS IN CERTAIN INDUSTRIES (£p)
(October 1972)

	Men.	Women.
Vehicles	41·63	23·81

* Including industries not listed
† Excluding railways

most industries it was cut from 48 to 44 hours soon after the war, a 42-hour week was introduced between 1960 and 1962, and there was a movement towards a 40-hour standard working-week in the late 1960s.

Short-time, the working of less than the standard week, has not been common since the war. It has been important in particular industries at particular times; but even at the end of 1971—with a national rate of unemployment of over 4 per cent—it was far smaller than overtime. Then 105,000 operatives in manufacturing were on an average short-time of 12 hours a week—a total 1·2 million hours lost as against 13·6 million hours of overtime in the same week.

Earnings and Rates.

Overtime is not, however, the main reason why earnings exceed minimum wage-rates; for most

workers earn very much more than the minimum in the standard working-week. One reason is payment by results, the system of payment under which the worker's wage depends partly on output. The commonest form is still the piecework system, under which pieceworkers are paid a fixed low rate per hour for each hour worked plus a fixed piecework price for each operation performed; but increasingly employers tend to prefer, as a more effective incentive, some scheme under which the bonus payment is related to the output of a larger group or to that of a whole factory. With payment by results systems—these cover about 40 per cent of the workers in manufacturing industry—earnings rise as productivity rises, and, as usually such workers also participate in advances in wage-rates negotiated between employers and unions, the gap between earnings and wage-rates tends to widen for them. So workers not paid by results press for similar advances for themselves, and in times of booming trade get them under a wide variety of names and forms—merit payments, lieu rates, compensation bonuses, etc.

Between 1955 and 1970 wage-rates rose by 107 per cent and earnings by 160 per cent. The advance in rates was little more than the rise in retail prices—which was 73 per cent—so that anyone who actually earned the minimum rate throughout was not much better off. But earnings rose considerably more than prices, so that the main source of the extra real income of the working-class is to be found in the widening gap between earnings and rates.

Wage Negotiation.

In Britain there were 10·3 million trade union members in 508 unions in 1969. Most of these unions are very small, almost 400 having less than 2,500 members, but 22 have a membership of over 100,000. The main job of unions is collective bargaining with employers, and in most industries most employers also belong to associations which bargain collectively on their behalf. Some big firms, however, prefer to remain outside the associations, and strike their own bargain with the unions. Before the war many firms tried to encourage the formation of Company Unions, *i.e.*, of unions confined to employees of a single firm; but this is now uncommon. In some lowly paid trades—catering, baking, dressmaking, agriculture and others—minimum wages are fixed by Wages Boards or Councils set up by the Department of Employment; and representatives of the workers and employers, and independent members, meet together to reach agreement on the settlement to be recommended to the Minister. But over most of industry the aim of collective bargaining is to reach voluntary agreement, and the Department of Employment intervenes only when no agreement is reached. Even in the nationalised industries, the Government does not usually intervene unless negotiations between the Boards and the unions break down.

The usual pattern of negotiation is like this. First, the union puts in a claim for an all-round increase, usually much larger than it expects to get. Then after a time the employers reply, often offering a much smaller increase, and sometimes none at all. They then argue round a table until either they reach agreement or they definitely fail to reach agreement. If the latter happens the next step varies considerably from industry to industry. Many industries have their own "conciliation" machinery, in which outsiders try to help the two sides to reach agreement. Some, though not many, also have their own "arbitration" machinery, in which outsiders can recommend a solution of the dispute, which is sometimes binding and sometimes not. It depends on what the two sides have agreed on in advance. Many industries have no machinery of their own and depend on the general facilities the Minister responsible can offer. He may appoint an impartial conciliator; or he may, with the agreement of both parties, refer the matter to the Industrial Court, which arbitrates between the parties; or he may set up a Court of Enquiry which enquires into the dispute and makes recommendations, which are not binding on the parties; or he may decide to do nothing at all, if he judges intervention to be useless. Nor need either unions or employers call him in; the former may opt to put pressure on the employers immediately either by strike action, or by banning overtime or piecework, or by other action.

Thus the British Government traditionally has little power to control wages directly or to impose agreements. The recent attempts to introduce compulsion in wage-determination are described in Part IV.

Important Negotiations.

A few negotiations are particularly important in determining how wages rise in a year; for the pattern of later settlements tends roughly to follow those of earlier settlements. Probably the most important of all are those between the Confederation of Engineering and Shipbuilding Unions—an organisation representing 3 million workers—and the Engineering Employers' Federation, as this single negotiation directly affects the wages of 3¼ million workers, and indirectly many more. On several occasions since the war negotiations between these two have broken down, and only finally been settled after a Court of Enquiry had recommended a compromise wage-advance. The Confederation is a special negotiating body comprising all the unions who have members working in the engineering and shipbuilding industries. These include many small, skilled workers' unions, such as the Patternmakers' Union, but they also include, besides the 1-million-strong Amalgamated Engineering Union, the two large general unions, the Transport and General Workers' Union, with about 1¼ million members, and the General and Municipal Workers' Union, with not far short of a million. These last two represent the semi-skilled and unskilled workers, and conflict between them and the skilled unions concerning differentials is common.

Strikes.

The strike is the unions' weapon of last resort. Most unions maintain strike funds in order to support their members when they call them out on strike; but these funds are small, and strike pay is usually very much below normal wages. So unions cannot afford to call strikes irresponsibly, and major official strikes are uncommon. In most years there will be one or two, but not more, and the total number of working-days lost is usually negligible—less than one day per head. Even in the industry affected the lost working-days are usually made up in the following weeks by overtime. Nevertheless, the big strikes are important; for the success or failure of one big strike can affect the results of all the other collective bargaining under way at the time.

Most strikes are neither large nor official nor about wages. An official strike is one called by a union, usually by decision of the national executive, and is usually the result of collective bargaining about wages. But unofficial strikes called by local leaders are often about other matters. Few of the big unofficial strikes which have plagued the docks since the war were about wages; rather they reflected job insecurity and the poor state of labour relations in that industry. Much the same may be said about the continual strikes in shipbuilding, many of them caused by demarcation disputes concerning which jobs should be done by which type of skilled worker. Other strike-prone industries are mining and vehicles. In most industries there are very few strikes, and even in shipbuilding, with the worst record of disputes, losses average little more than one day a year. But strikes are often a symptom of industrial trouble—frequently occurring in industries with stagnant productivity and declining employment. They are sometimes really a form of industrial protest, and employers have to bear their share of the blame.

In 1970 there were in all 3,900 strikes in the United Kingdom; 1·8 million workers were directly or indirectly involved at the establishments where the stoppages occurred, and 11 million working days were lost. This was a bad year for strikes: the growing unemployment accelerating inflation and worsening industrial relations after 1967 increased the incidence of work stoppages in Britain. But is Britain particularly strike-prone in comparison with other industrial countries? In 1970 Britain lost 740 days

through strikes per 1,000 persons employed. Canada lost 2,180, the United States 2,200 and Italy 1,500; but the British record was bettered by France which lost 190, Sweden with 40, and West Germany with only 10.

In its Industrial Relations Act of 1971 (to be repealed by the Labour Government) the Conservative Government laid down new laws for the regulation of industrial relations and for the curbing of strikes.

Prices and Real Incomes.

The aim of a trade union is to get for its members a higher stardard of living, and its success depends on the extent to which wage advances exceed the rise in the cost-of-living. Prices rose very rapidly (by over 30 per cent) between 1949 and 1953, and earnings only just kept ahead in this period. But since then *real earnings* (*i.e.*, the command which money earnings have over goods and services) have risen steadily. Thus, between 1955 and 1970, the real earnings of a wage-earner rose by 50 per cent.

WAGES AND PRICES
(1955=100)

	Weekly wage rates.	Weekly earnings.	Index of retail prices.	Real wage rates.	Real earnings.
1950 .	73	68	77	96	91

Price Changes.

In the calculation of real wages it is usual to make use of the *index of retail prices*, commonly called the cost-of-living index. The index is calculated monthly by the Department of Employment, and it naturally has an influence on the course of wage negotiations. Indeed, up to 1958 it was probably the dominant influence, and sometimes automatic adjustment for cost-of-living was written into wage agreements.

The table shows how consumers allocate their expenditure among different commodities in Britain, and how the prices of these commodities have moved over time. Almost 30 per cent of expenditure in 1970 was on food; and housing, fuel, and light between them accounted for 18 per cent. Drink and tobacco represented 11 per cent; and expenditure on transport and vehicles no less than 12 per cent. Comparing the allocation of expenditure in 1952 and in 1970, we see in particular the growing importance of housing and the declining importance of food in household budgets.

Price changes have not been the same for all types of goods. For instance between 1956 and 1970, when the total index rose by 65 per cent, housing went up by 122 per cent and fuel and light by 90 per cent; but the prices of food, clothing and especially durable household goods rose less than the average. It is partly the fall in the *relative* price of food and partly the fact that as people grow richer they choose to spend less of of their income on food which accounts for the declining share of food in total expenditure.

The general retail price index is calculated by weighting each of the commodity price indexes by the proportionate importance of that commodity in total expenditure in a particular year, and then summing all the indexes, *i.e.*, the general index is a *weighted average* of its constituent indexes. A different pattern of expenditure would mean a different set of weights, and hence a different cost-of-living index. For instance, the poor—and particularly pensioners—spend a higher proportion on the basic necessities: food, fuel and light, and housing. It is possible that the cost-of-living rose more for the poor than for the rich over these years.

The cost-of-living index has not risen evenly in Britain. There were spurts of rapid inflation in the periods 1950–52 and 1954–56, followed by a decade of relatively little inflation (averaging 2·9 per cent per annum). After 1967, however, the rate of inflation accelerated, rising progressively from 2·5 per cent per annum between 1966 and and 1967 to 9·4 per cent between 1971 and 1972.

The Causes of Inflation.

(i) Import Prices.

Prices charged in the shops are determined by a great many factors, over many of which the Government has little or no control. First among these is the price of imports. Prices of imported food and raw materials are determined in the world markets, in which Britain is only one of many purchasers. In the raw material markets the U.S.A. is usually the dominant purchaser, and prices depend greatly on the level of economic activity there. In the food markets British purchases are much more important, since the U.S.A. grows most of its own food, and is a large exporter of some foods. Prices in raw material markets are continually changing, and can fluctuate wildly. For instance, the average price of copper rose 40 per cent between 1954 and 1955, and then fell back in 1957 to 10 per cent below its 1954 level. Fluctuations at the time of the

Korean War were even more fantastic. The price of wool rose by over four times, and then came down just as abruptly to only a quarter above its earlier level; the price of rubber behaved similarly. The large rise in import prices, coming on top of the rise that had been brought about by devaluation, caused the cost-of-living index to shoot up sharply in 1951. Since then, however, the rise in import prices has been less rapid than the domestic inflation; so that imports cannot be directly blamed for the continuing rise in prices since 1951. The source has to be looked for in the tendency of wages, salaries, profits, and other incomes to rise faster than real output; and this they have done in almost every year since the war.

(ii) Demand-Pull Inflation.

An alternative explanation of inflation is that it arises not so much from increased costs as from demand pressures increasing prices and profits. If there is an increase in aggregate demand for goods and services in the economy, how does the economy respond? If it is operating at less than full employment, producers are able to expand their production to meet the additional demand. But if full employment has already been achieved, it is the price level and not production which rises. Given an excess demand for goods and services, there is competitive bidding for the limited supplies and producers are able to sell at higher prices. A more sophisticated version of this argument recognises that full employment cannot be precisely defined: rather, there are degrees of less or more unemployment. Bottlenecks appear in different firms and industries at different stages; so that any increase in demand is met by an increase in both prices and production. But the lower the rate of unemployment, the more does the response take the form of price increases.

A variant of the demand-pull theory is the so-called *quantity theory of money*, in which inflation is seen as a response to an increase in the supply of money: there is too much money chasing too few goods. The theory dates back at least to David Hume, but it was generally discredited as a result of the writings of Maynard Keynes in the 1930s (*see* G21). However, it was recently revived by Milton Friedman and has received some measure of acceptance among economists in the United States (*see* G25).

The evidence for the demand-pull theory of inflation in Britain is very slight. No doubt there are times at which demand contributes to inflation in the economy as a whole or in particular sectors. Thus, for instance, the great shortages during and immediately after the war would no doubt have generated rapid demand inflation had it not been for rationing and price controls; and the spurt of inflation between 1954 and 1956 was associated with a very high pressure of demand. On the other hand, inflation has occurred even in periods of relatively high unemployment. Moreover, the method by which most firms price their products is on the basis of their costs; so that most prices are not directly sensitive to the pressure of demand. A more plausible mechanism by which demand might influence prices indirectly is through its effect on wages.

(iii) Wages and Inflation.

When a trade union negotiates a wage advance for all or most employees in an industry, firms will immediately consider whether they should increase their prices to cover their increased wage-costs. As it is common practice for firms to fix the selling prices of their products by first calculating the direct cost of labour and of materials, and then adding on a percentage to cover overhead costs and profits, they will tend to want to raise their prices not only to cover the cost of the wage advance but also to cover their percentage addition. Moreover, in deciding whether or not their customers will stand for such increases, firms will be influenced by the knowledge that their competitors have to pay the increased wages too, and will probably therefore be raising their prices. So industry-wide wage advances—and changes in costs of materials—are particularly likely to be passed on to the consumer; and, as wage-earners are also consumers, to generate further demands for wage advances to cover the increased prices. Profits per unit also go up under this tendency to set prices on a *cost-plus* basis; but it is the wage advance which tends to set the spiral off, by providing the opportunity for price increases.

Once this spiral gets going, it is very hard to stop it. In general, the requirement is that wage earnings should not rise faster than productivity (output per man). But as in some industries productivity is very slow to rise, and as it would be unfair and impracticable to exclude their workers from participating in any general rise in the standard of living, this requirement means that in industries with a rapid growth of productivity wage advances should be kept well below the rate of rise of productivity. For two reasons this is rather difficult. First, rising productivity often raises the wages of some workers in these industries automatically, because they are paid by results or through some incentive scheme. The rise of wages from this source takes the form of a tendency on the part of earnings in these industries to rise faster than wage-rates; but that does not mean that all employees benefit, or that the unions in these industries will not press for the same rate of increase in wage-rates as is achieved in the slowly-growing industries. Second, employers in the rapidly-growing industries have far less reason to resist demands for wage increases than those in slowly-growing industries. Indeed, they are quite likely to bid up wages in order to get the labour they need, rather than to try to hold down wages.

There are therefore major problems in preventing a faster rise in wages than in productivity, with its consequence of rising prices. And once a wage-price spiral has started, the problems become more acute because unions and employers become accustomed to substantial annual advances in money wages. A main source of continuing price inflation has been the tendency of money wages to continue to advance at a rate that was appropriate when the cost-of-living was going up sharply, but ceased to be appropriate in later years.

(iv) The Phillips Curve.

Even if wage behaviour is primarily responsible for inflation, the pressure of demand may still be important. If unemployment is low and unfilled vacancies high, there is competitive bidding among employers to obtain or retain their workers. Moreover, with the economy booming the bargaining strength of trade unions increases: employers are more willing to concede wage demands. These possibilities have led economists to postulate—and indeed to measure—the so-called *Phillips Curve* relationship: the lower the level of unemployment, the faster the rate of increase in wages. Such a relationship has been found to exist in the British economy over some periods. But events after 1967 reveal the danger of postulating "general laws" in economics: inflation accelerated despite high and growing unemployment (*see* G45). Clearly, changes in the cost-of-living, expectations for the future, Government policies and the degree of militancy of trade unionists can all have a significant influence on wage behaviour; and the level of demand may at times be relatively unimportant.

The Effects of Inflation.

British Governments have been concerned about inflation mainly because of its effects on British competitiveness, and hence on the balance of payments. If our costs rise relative to competitors' costs, British exporters find it more difficult to compete in foreign markets if they raise their prices; and if they keep prices down in order to compete, this implies their having to accept lower profit margins on exports than on sales in the home market, and so discourages exporting.

But inflation can have other harmful consequences. It often produces a redistribution of income, with the strong gaining at the expense of the weak, *i.e.*, the poorly organised workers and the pensioners. In inflationary conditions income gains can appear to result not so much from work or sacrifice as from ingenuity and speculation and the exercise of economic and political power. Inflation can breed uncertainty, insecurity and

industrial unrest. For instance, during the rapid inflation of 1970 the number of strikes was up by 80 per cent on the annual average for 1960–66, and the number of working days lost was up by 250 per cent. This was partly a cause but also partly an effect of the inflation.

Government Policy against Inflation.

There are several possible methods of attack on the inflationary spiral of wages and prices. Their usefulness will depend on the causes of the inflation.

One policy appropriate to most inflations, and also helpful to other objectives of economic policy, is to achieve a faster rate of productivity growth. The faster the growth of average productivity the faster can average incomes rise without an increase in average prices. Only if faster growth in productivity raised the growth of money wages proportionately would the inflation not be reduced. Comprehensive and detailed government control of wages except as an emergency policy must probably be ruled out for political and institutional reasons, and so must comprehensive and detailed control of prices. Experience suggests that such detailed policy, except as a temporary general "freeze", would be very difficult to operate and, if successful, would involve a major loss of flexibility in the economy. At the other extreme, general exhortations to unions to exercise restraint on wages, and to manufacturers to exercise restraint on prices, have probably had little effect.

The Government can attempt to regulate inflation by controlling purchasing power through its monetary and fiscal policies, the nature of which will be examined below. There is a danger that curbing demand also curbs the growth of output and productivity in the economy; so conflicting with other objectives of economic policy. Moreover, there is no certainty that inflation is sensitive to the rate of unemployment over the politically acceptable range of unemployment; and experience in Britain after 1967 suggests that it is not.

There is no easy solution—difficulties and disadvantages are attached to every measure for controlling inflation. In Part IV we shall discuss the solutions which have been attempted since 1960 (*see* **G45-9**).

4. MONEY, BANKING, AND FINANCE.

Money.

In Britain money consists of bank-notes, coinage, and banks' debt. Bank-notes—mainly in denominations of £10, £5, and £1—are issued by the Bank of England, which has been publicly owned since 1946, and which acts in effect as an agent of the Government. We shall see below (**G22**) how commercial banks can also create money.

The total size of the bank-note issue is not a good guide to the amount of purchasing power in the economy. The Bank of England has stated that it was now its policy to issue bank-notes in accordance with the convenience of the public, and not to use this means of controlling the amount of purchasing power. As a result, the various checks on the size of the note issue—in particular the Parliamentary control over the fiduciary issue, *i.e.*, the permitted maximum level of the note issue—have become functionless and may be ignored. An increase in the value of the note issue is now only a symptom and not a cause of inflation.

Determination of Income and Employment.

What matters is the amount of purchasing power available to the public. Most private expenditure is financed out of income—after paying taxes—and most government expenditure out of taxes; but most investment, public and private, and a growing amount of purchases of durable goods by consumers, is not financed out of income, but out of borrowing of one kind or another. And the primary purpose of monetary policy must be to keep the total of this kind of expenditure out of credit in line with the amount of savings private individuals and profit-making companies are prepared to make out of their incomes.

A more accurate distinction is between expenditure, the amount of which is related to current income, and expenditure which is not related to income. The community tends to spend a fairly constant proportion of its disposable income on non-durable consumer goods and to save the residual proportion (*see* **G15**); whereas investment decisions and expenditure on consumer durables are generally unrelated to income. The amount of saving being undertaken therefore depends on the community's *propensity to save* and on the level of community income; the higher total income, the higher is total saving. Thus there must always be some level of income at which saving would equal the amount of expenditure not related to income.

Total demand for goods and services in the economy is the sum of consumption and investment expenditures. The value of whatever is produced accrues to the factors of production—wage-earners, profit-recipients, rentiers—as income; *i.e.* national product necessarily equals national income (*see* **G12**). Income is either consumed or saved. To recap: total demand equals consumption plus investment expenditures, and total output equals consumption plus saving. Therefore, if investment expenditure exceeds the amount which the community wishes to save out of its current level of income, it means that the total demand for goods and services exceeds total current output. If output cannot be increased because men and machines are already fully-employed, prices and wages and also imports are forced up in response to the demand. If, on the other hand, investment expenditure falls short of saving out of full-employment income, production and employment are reduced below the full-employment level.

There is no automatic mechanism in our economic system which ensures full-employment of resources, and it is the task of Government to balance saving and investment at the right level of employment. This important fact was first established by the great economist J. M. (later Lord) Keynes. Prior to the Great Depression, economists believed that any divergence from full-employment was a temporary phenomenon, which would right itself. However, in the 1930s Keynes produced a new explanation of how income and employment are determined; and so brought about what has come to be known as the *Keynesian Revolution* in economics.

Government Control of Income and Employment.

The Government can control the level of income and employment in various ways. First, in many fields the Government has only very restricted powers to influence behaviour. It cannot compel persons or companies to save; it can only offer them inducements to do so in the form of higher interest rates or of tax concessions on receipts from interest; and their effectiveness is limited. Nor in general has it very much direct power over expenditure out of credit. It can control the conditions under which hire-purchase agreements are made—and this does, temporarily at any rate, make a great deal of difference to the amount of goods bought on hire-purchase. It can to a certain extent influence private companies in their investment policies by granting and withdrawing incentives to investment (*see* **G13**); but it is doubtful quite how much influence these changes have. And it can, if it chooses, exercise direct control over building, by allowing building only on licence. This power, however, is not now used in order to control the level of investment, but only in order to encourage it in depressed areas and discourage it elsewhere. The only authorities over whose investment the Government does have real control are the nationalised industries; and there are obvious disadvantages in any system whereby investment in public utilities is determined, not by the need for such investment, but by the need to balance saving and investment.

The two main means remaining are fiscal and monetary control. If the Government thinks there is going to be a shortage of private saving it raises more in taxation or reduces its current expenditure and so increases the Budget surplus (*see* **G27**). The second form of control is more complex; in principle, the aims are twofold. One is to keep the amount of credit-creation down

(or up) to the required extent; the second is to ensure that the Government gets the share of saving it needs to cover its investment programmes. The complexity arises from the interrelations between these two tasks.

The Government as Borrower.

The Government is a heavy borrower from the rest of the economy. In 1970 total outstanding public borrowing—by government, nationalised industries, and local authorities—stood at over £43,000 million, equivalent to 1·1 times the annual national income. Most of this immense National Debt was built up during the war, when government expenditure far exceeded taxation; but the total continues to advance year by year, owing to the heavy capital requirements of the nationalised industries.

The Government borrows in six main ways. First, the issue of bank-notes is in effect a form of government borrowing. Second, it borrows from foreign governments. Third, it borrows from companies through tax reserve certificates, which are a means by which companies let the Government have the taxes they would have to pay on profits as the latter are earned, rather than when the taxes legally become due. Fourth, it borrows direct from private individuals through the various forms of national savings. In all forms of national savings the Government pays interest—or in the case of premium bonds prizes in *lieu* of interest to the winners of the monthly draw—to the holders, who have the right either on demand or at short notice to the repayment of their loans.

Gilt-edged Securities and Treasury Bills.

The fifth and sixth methods of borrowing are through the market. The main method is through the Stock Exchange by the issue of fixed-interest securities, called *gilt-edged securities*. In 1970 the net amount owing to the public on all such securities was nearly £22,000 million—a half of total public debt. Most gilt-edged securities are promises to repay at a specified date in the future the amount originally borrowed; and in the meantime to pay a fixed amount of interest each half-year. Some gilt-edged securities are irredeemable, and consist therefore simply of a promise to pay the interest in perpetuity.

Most gilt-edged securities are held by institutions: the banks, discount houses, and other major financial institutions of the country, and foreign governments (whose holdings represent their sterling balances, (*see* **G9**); only a small part of the total being held by private individuals. Gilt-edged securities, unlike national savings, are not liquid assets. Until they become due for replacement they can only be sold on the Stock Exchange for what they will fetch, and variations in their market value are quite considerable. Dealings in second-hand securities can have important effects on the economy. Variation in the market price of securities implies an inverse variation in the effective rate of interest which they earn. This in turn can influence the general level of interest rates, hence the amount of investment which it is profitable to carry out, and hence the general level of economic activity.

The sixth form of borrowing is by means of *Treasury Bills*, of which £1,400 million were outstanding in 1970. A Treasury Bill is an extremely short-term loan to the Government—usually for three months. Each week the Treasury offers for sale some £300 million of these, and a number of specialised institutions bid for them. The difference between their bids and the value of the bills on repayment is called discount, and is a substitute for interest. These bills play a crucial role in the monetary system.

Government Borrowing and Liquidity.

Monetary policy consists largely in varying the way in which the Government borrows to finance its expenditure. This is because the form of borrowing affects the amount of *liquidity* in the economy. All financial institutions have some policy regarding liquidity. In general they try to maintain sufficient reserves either of cash or of assets which can be immediately converted into cash to meet any foreseeable sudden increase in their commitments. But they do not hold all their assets in liquid form. The chance that all their creditors simultaneously demand their money back can be ruled out, and therefore most of them act on the principle that they should maintain cash or other liquid assets to cover some percentage of their total outstanding commitments. Whereas currency and Treasury Bills are regarded as liquid assets, government securities and most other forms of government borrowing are illiquid.

If therefore the Government borrows more by issuing currency or Treasury Bills and less by other means, this action increases the amount of liquid assets about and therefore the total lending which financial institutions think it safe to make. And, conversely, if the Government borrows less by issuing currency or Treasury Bills and more by other means, this tends to decrease the total amount of loans which financial institutions are prepared to make. However, government control over the way in which it borrows is circumscribed. The public can be persuaded to hold more government securities only if the rate of interest earned on securities is increased. In the 1950s the British Government was unable to prevent a rapid accumulation of short-term debt, even though it allowed the rate of interest earned by irredeemable government securities to rise from less than 4 per cent in 1950 to over 5 per cent in 1960.

The Commercial Banks.

In the centre of the financial world stand the commercial banks. In England these are known as the London clearing banks. In this country, unlike the United States, the banking system is highly concentrated; there being four main banks with branches in every town. The commercial banks are important because their debts are used by the public as money. Anyone who has a bank current account can sign cheques or withdraw cash on demand up to the limit of his account. Because they can be used as a means of payment just as readily as bank-notes, bank deposits are money.

Commercial banks earn a profit by borrowing funds and then lending part of these funds at higher rates of interest. Because it is unlikely that all deposits will be withdrawn at once the banks hold only a small proportion of their deposits in the form of cash. Until September 1971 the Bank or England required them to hold 8 per cent; and we see in the table that the average

cash ratio in 1970 was 8·1 per cent. Before September 1971 they also held by convention liquid assets (cash plus Treasury bills and money at call and short notice) equal to at least 28 per cent of their deposits; the ratio being 31·7 per cent in 1970. These liquid assets are easily transferable into cash. Their remaining assets are more remunerative; the majority being advances made to the public and earning a rate of interest higher than the rate at which the banks can borrow from the public or from the Bank of England. In 1970 cash held by the commercial banks amounted to £826 million, whereas the public had deposits with the banks totalling £10,151 million. Thus the banking system can create money: it does so by accepting bank deposits far in excess of the cash held to meet demands for these deposits.

In September 1971 the Bank of England introduced new arrangements for the control of credit in the United Kingdom. The clearing banks were required to observe a minimum reserve ratio of 12·5 per cent between their *eligible reserve assets* and their *eligible liabilities*. The eligible reserve assets comprise balances with the Bank of England, Treasury Bills, company tax certificates, money at call, and a few short-dated bills, *i.e.*, the banks' holdings of cash were excluded; and eligible liabilities are sterling deposits.

The Control of Commercial Banks.

The first step in any credit squeeze is to put pressure on the commercial banks by reducing their liquidity; so causing them to restrict their advances to would-be investors. This can be done in various ways. One is by means of *open market operations*, in which the Bank deliberately sells more government stock than it otherwise would. The purchasers pay by cheque, and thus create a debt from the commercial banks to the Bank of England. Such debts have to be settled in cash, and so pressure is put on the banks' liquidity. Another method is through the Bank's *minimum lending rate*, *i.e.*, the rate at which the Bank is prepared to lend to the clearing banks. Until October 1972 this was known as *Bank Rate*. If this rate is raised the rate of discount on Treasury Bills is pushed up. A high rate of discount on these makes them appear attractive investments to those who do not normally buy them, and the commercial banks find it difficult to get as many of them as they would like. So again there is pressure on the banks' liquidity.

Since 1958, the monetary authorities have had the power to call upon the banks to make *special deposits* in cash with the Bank of England. Unlike other deposits of the banks with the Bank of England, special deposits cannot be treated as forming part of the liquid assets of commercial banks. This is in effect another way of putting pressure on the liquidity position of banks: the necessity of making such deposits could force them to sell securities or reduce advances. Special deposits amounted to 2·5 per cent of the banks' total deposits in 1970.

Faced by pressure on their liquidity, the banks have to take steps to restore their liquidity either by selling securities or by calling in advances. Neither method brings in much cash directly; for since the banks will be paid by cheque rather than in cash, they have to go on until the depletion of deposits caused by the paying of these cheques cuts down the total of deposits to the level where liquid assets once again meet the minimum reserve ratio required. To this there is one major exception: if the Bank of England buys the securities the banks sell—and the need to ensure an orderly market may force it to do so—then selling securities brings more cash into the banks, and thus enables them to replenish their liquidity.

This exception became important in the 1960s, when the monetary authorities appeared to give greater priority to the management of the National Debt than to the regulation of the commercial banks' liquidity. An alternative technique of monetary control was therefore increasingly used in the 1960s, *viz.*, the imposition of quantitative controls on bank lending by means of directives. These controls were often of a selective nature, *e.g.*, giving preference to exporters and investors.

The arrangements introduced in 1971 involved a return to earlier methods of credit control. Quantitative lending directions were abolished and less emphasis was to be placed on the regulation of interest rates. Instead, greater emphasis would be placed on the control of credit and the money supply, by means of the new minimum reserve ratio and calls for special deposits.

Bank Advances and Other Credit.

Bank advances are the simplest form of credit: the customer is simply given the right to sign cheques beyond his credit account and interest is charged on the overdraft. Alternatively, he is granted a personal loan, with more specific rules for repayment. Most bank advances are made to business. It is a common practice in business to finance working capital—stock and work-in-progress—out of bank advances, and to depend on more permanent forms of borrowing for the purchase of fixed capital. But there are no fixed rules: business gets its finance wherever it can.

Apart from clearing banks there are many other banks and financial institutions from which to borrow. For this reason a squeeze on bank advances alone is unlikely to be an effective way of restricting credit. Large firms, in particular, are in a good position to tap other sources of credit if necessary. The two forms of expenditure which have been most affected by credit squeezes are business stocks and housebuilding. Housebuilding depends on the availability of building society loans, and these depend on the amount of money which the public deposits with the building societies. When other interest rates rise building society deposits become less attractive.

When there is a squeeze on bank advances and borrowers have to resort to other sources of credit, the cost of borrowing is usually more expensive. But this need not be a deterrent to borrowing, as interest payments normally form only a small part of business costs. Most business capital expenditure is not sensitive to the rate of interest. Expenditure on stocks and on housebuilding are the two sorts of expenditure likely to be influenced by interest charges. But housebuilding is made less sensitive by the fact that when the rate of interest rises, it is the repayment period for the mortgage, and not the annual interest charge, which is usually increased.

It was the Government's intention in introducing the 1971 arrangements that there should be both greater control over credit and greater competition among the different financial institutions. The eligible reserve assets ratio was therefore imposed not only on the clearing banks but on all banks; and also on other finance houses with eligible liabilities exceeding £5 million, for whom the minimum ratio would be 10 per cent. The scheme for the calling of special deposits was also extended to these other financial institutions.

The Stock Exchange.

The banks through their advances are the main providers of short-term credit; but most long-term credit is provided through the Stock Exchange. In 1970 the total market value of all securities traded on the Stock Exchange was £120,000 million, of which £100,000 million represented stocks or shares in public companies. There are three main types. *Debenture Stock* is simply a fixed-interest loan. *Preference Stock* is a fixed-interest loan, with provisions for waiving the interest if the company fails to earn profits. Preference shareholders cannot get a company declared bankrupt if it does not pay them a dividend; but Debenture holders can. The third type—and much the most important—is *Ordinary Shares*. Nominally the owner of an Ordinary Share is a part-owner of the company concerned, with most of the rights of ownership. He has no right to any particular dividend or interest payment, but only the right to participate in net profits if there are any. In addition to stocks or shares in public companies, British Government gilt-edged securities worth £17,000 million were quoted on the Stock Exchange.

The Return on Financial Assets.

Each type of holding has obvious advantages. The fixed-interest security brings in a guaranteed income; the Ordinary Shareholder has no such

guarantee, though in practice during much of the post-war period the risk of a decline in dividend was small. In a time of inflation the risks attached to holding fixed-interest securities are in some ways greater than those attached to holding Ordinary Shares; for, while Ordinary Shares appreciate in market value when there is inflation, fixed-interest securities tend to fall in market value, because the Government is forced to increase interest rates as an anti-inflationary measure. Furthermore, in the long run the growth of the economy tends, even without inflation, to raise the value of Ordinary Shares by increasing the value of companies. And, lastly, for investors who pay tax at heavy rates on their incomes—and most large personal investors in the Stock Exchange are rich people—capital gains are worth more than income in dividends. So for private investors the Ordinary Share was a much better bet in the 1950s; and because Ordinary Shares were so popular, the yield on such shares—the ratio of dividends to market value fell below the yield obtainable on Government securities (*see* table).

PERCENTAGE YIELD ON FINANCIAL ASSETS

	Bank Rate. (range during year)	Treasury bill rate.	Irredeemable government bond rate.	Ordinary Share rate.
1950 . .	2	0·5	3·5	5·3
1955 . .	3–4·5	3·6	4·2	5·4
1960 . .	4–6	4·9	5·4	4·6
1965 . .	6–7	5·9	6·4	5·5
1970 . .	7–8	7·0	9·2	4·5
1973 . .	7·5–11·5	9·5	10·8	4·1

Most Ordinary Shares are held by private individuals, some indirectly through Unit Trusts; but increasingly in recent years holdings by insurance companies and pension funds have become more important, because of the growth of private superannuation schemes. Insurance companies and pension funds cannot afford to take risks, so the main bulk of their funds is still invested in fixed-interest securities; but they have shown a growing tendency to increase the proportion of their funds invested in Ordinary Shares. This switch, by lowering the demand for gilt-edged securities relative to Ordinary Shares, contributed to the downward pressure on the prices of gilt-edged securities.

The more rapid rate of inflation in the late 1960s and early 1970s reduced the attractiveness of gilt-edged and paper assets of fixed value, and increased the attractiveness of assets likely to appreciate in value. However, the accompanying recession in the economy, giving rise to pessimistic profit expectations, acted to discourage shareholding. Land and housing were much in demand as a good hedge against inflation, and consequently their price rose rapidly (*see* G26).

Monetary Policy.

Monetary policy in Britain in the post-war period has been subject to waves of fashion: it has undergone periods of popularity and of disfavour.

(i) Cheap Money Policy.

The post-war Labour Government pursued a *cheap money policy*. There was no major use of monetary policy as an economic regulator: Bank Rate, for instance, was kept at 2 per cent throughout, and the rate on Treasury Bills was only ½ per cent. Instead the Government relied on controls and on fiscal measures to keep inflation in check. For this neglect of monetary controls there was, in fact, a very good case: the pent-up demand for goods was so strong, and the funds available to companies and individuals so large, that monetary restrictions would not have made very much difference.

(ii) Revival of Monetary Policy.

The Conservative Government reintroduced ctive monetary policy in 1951. Bank Rate was raised—reaching a peak of 7 per cent in 1957—and manipulated in an attempt to control demand. In addition to influencing the cost of credit by manipulating interest rates, the Government influenced the availability of certain sorts of credit through the credit-squeeze. At times it made it more difficult for the banks to extend their lending by operating on the banks' liquidity position, and it also issued more or less strongly-worded "requests" that banks should restrict the growth of, or secure a reduction in, their advances.

A form of monetary control which was particularly important after 1950 was the control or hire-purchase. By raising or lowering the proportion of the price which has to be paid as a down-payment, and by shortening or lengthening the time over which repayments can be made, the Government was able greatly to influence the volume of hire-purchase transactions, and therefore the use of this particular form of credit. These controls, of course, only affect the rather narrow class of goods—cars, furniture, washing machines, television sets, etc.—for which a substantial proportion of sales are on hire-purchase terms. In consequence, the output of those industries concerned with the manufacture of these goods fluctuated widely.

(iii) The Radcliffe Report.

In 1959 the Report of the Radcliffe Committee on the working of the monetary system was published. It is complicated, because the monetary system is complicated; but it is written in terms which can be understood by the layman. Running through the Report is a scepticism concerning the likely general effectiveness of monetary policy, both as an anti-deflationary and as an anti-inflationary weapon of control. In the former case, it is clearly difficult to encourage spending by making credit more easily available, if business prospects are so poor that no investment looks profitable. On the use of monetary policy to counter inflation in the 1950s, the Committee felt that, because only some of the channels of finance had been obstructed, monetary restrictions had little effect on the pressure of total demand but did create financial inefficiency. The more conventional instruments (*e.g.*, Bank Rate) failed to keep the economy in balance; and when high pressure of demand, through its effect on inflation or the balance of payments, drove the Government to take quick action, it concentrated on hire-purchase restrictions and on public sector investment cuts. There was no smooth adjustment of the economy to monetary policy; rather there were vicious and harmful effects on the sectors singled out in this way. However, Radcliffe recognised that monetary measures do influence confidence in sterling.

(iv) The New Monetarism.

From 1964 onwards Britain has, with only brief respite, been hampered by severe balance-of-payments difficulties. Interest rate policy was used in times of sterling crises to stem speculative outflows of capital. A rise in interest rates increases the attractiveness of holding sterling balances, and stern monetary measures may be taken as indicative of the Government's determination to solve its problems without recourse to devaluation. Bank Rate reached a new peak of 8 per cent late in 1967. In the 1960s the monetary authorities did not attempt to regulate the money supply. Rather, they were concerned to control and to stabilise the structure of interest rates in

THE COST OF PUBLIC SERVICES

Total expenditure	9,400	21,564	129	100·0

order to protect sterling and to manage the financing of the National Debt. It was apparently thought that a stable interest rate—and therefore price—of government securities would boost the demand for these securities and so reduce the cost of servicing the National Debt.

After 1968 the monetary authorities became increasingly concerned with control of the money supply. Partly this reflected the influence of Britain's creditor, the International Monetary Fund (*see* G9); and partly the emergence of a school of "Monetarist" economists. The new monetarism, of which Professor Milton Friedman of Chicago is the leading exponent, attributes great powers to the money supply in influencing the level of activity and the rate of inflation in the economy (*see* G20). These claims have been vigorously disputed: many economists regard them as far too simple an explanation of the working of the economy. Moreover, the empirical support for the theory is ambiguous, *e.g.*, the mere fact that the money supply and the price level rise together does not necessarily mean that it is the growth of the money supply which causes the inflation, rather than that the inflation induces the banking system and the monetary authorities to expand the money supply. Nor do all monetarists claim that monetary policy is the best short-run regulator of the economy. Friedman acknowledges that the size and timing of the effects of monetary policy are unpredictable, and himself advocates a slow but steady growth of the money supply.

Through its 1971 reforms the British Government intended in future to concentrate more on the money supply and the availability of credit, and less on stabilising interest rates in the pursuit of its debt policy.

5. ECONOMIC ASPECTS OF THE PUBLIC SERVICES

The Cost of Public Services.

In 1970 total public expenditure was no less than £21,600 million, about £390 per head. Of this total the central government spent about two-thirds, the local authorities about a quarter, and the public corporations' investment programme was responsible for the remaining one-twelfth. Total public expenditure more than doubled between 1960 and 1970; and rose as a proportion of the national income from 45 to 55 per cent.

The Government collects in revenue considerably more than it spends itself, but transfers funds to the local authorities, to the National Insurance Fund, and to the nationalised industries. The expenditure of the public sector as a whole generally exceeds its revenue, and the difference is met by net borrowing.

A breakdown of public expenditure is shown in the table. Not all categories of expenditure expanded at the same rate: expenditure on industry and trade (mainly the investment of public corporations and capital grants to the private sector), environmental services (water, sewerage, public health, parks, etc.), police and prisons, social security benefits, education, libraries, museums and arts, and local welfare services and child care increased faster than the total; and expenditure on defence, external relations, the agricultural subsidy, school meals, milk and welfare foods, and debt interest fell behind the total. Nevertheless, defence expenditure accounted for over 11 per cent of the total (*i.e.*, 6·4 per cent of national income) in 1970.

Public Housing.

Expenditure on public housing amounted to 5·6 per cent of public expenditure in 1970. Housing expenditure consists of two quite different items. There is the capital cost of building new council houses. This is financed out of borrowing by local authorities, both from the Government and from the market. There is also a recurrent cost, in the form of subsidies on council housing. This represents the difference between the cost of housing, including the cost of borrowing, and rents received on council housing. In 1970 costs exceeded the rents of £1,005 million by £323 million, so that the average council house tenant was paying 75p in the £ of the cost of accommodation.

Up to 1957 the Government contracted to pay a flat subsidy per year on every council house built. From 1957, government subsidies were no longer paid on ordinary new council houses, but in 1961 were reintroduced, in a form intended to encourage councils to charge higher rents on their existing houses. The Labour Government substantially increased the subsidy in 1967: it being calculated as the difference between interest payable on new housing at current interest rates and at 4 per cent.

In 1971 the Conservative Government made proposals for a drastic reform of council housing finance. It announced a scheme whereby councils should in future charge "fair rents"—the likely market rent for a dwelling if supply and demand for rented accommodation were in balance in the area concerned. The Government was also prepared to finance a rent rebate scheme whereby people in need, both council tenants and private tenants, could claim a rebate according to a formula based on family size and income. A slum clearance subsidy was also to be paid to councils and—to encourage housebuilding—a "rising costs" subsidy whereby the additional costs resulting from council house building were to be subsidised (*see also* D52-3).

The Housing Market.

Government housing policy must be seen in terms of the housing market as a whole. In 1970 there were some 19·1 million dwellings in the

United Kingdom, 49 per cent being owner-occupied, 30 per cent being council houses, and the remaining 21 per cent privately rented. The importance of owner-occupation has grown and that of private renting has declined: 10 years previously they had accounted for 42 per cent and 32 per cent of the total respectively.

This switch is largely the result of Government policy. Rent controls have meant that there is little incentive to build houses for renting, nor even to maintain existing rented houses: in 1971 over half the dwellings which had been declared "unfit" in England and Wales were privately rented. On the other hand, Government has given considerable tax advantages to owner-occupiers. Owner-occupied houses are exempt from the capital gains tax introduced in 1964 (*see* G49), and owner-occupiers can obtain tax relief on mortgage-interest payments. Since the abolition of the Schedule A tax in 1961—whereby owner-occupiers paid tax on the rental income imputed to their houses—this tax relief on interest payments must be justified as an inducement to home-ownership; but it is also a considerable subsidy to owner-occupiers, who tend to be the relatively well-off. In the tax-year 1970/71 the British Government gave tax-relief of £300 million to house-mortgagees; averaging £61 for each of the 5 million owner-occupiers benefiting. This total was only slightly less than the whole of the public subsidy on council housing in 1970.

The year 1953 was a peak for public sector housebuilding in the United Kingdom, when 262,000 council dwellings were completed. There was a trough in 1961 (122,000), a peak in 1967 (211,000) and a subsequent fall to 168,000 in 1971. On the other hand, the number of private dwellings completed rose steadily from 65,000 in 1953 to a peak of 226,000 in 1968. This was also the peak year for the total number of dwellings completed (426,000); the total falling to 364,000 in 1971. Over the 15 years 1955–70 the rate of inflation in the price of modern existing houses averaged 5 per cent per annum: somewhat faster than the rise in the cost of living. After 1970 there was a great surge in house prices: between December 1970 and December 1972 the average rise was no less than 30 per cent per annum. There are various reasons for this remarkable inflation. Partly it reflected the acceleration of general inflation (*see* G45); in such times it is sensible to hold one's wealth in the form of assets which will appreciate in value. It also reflected the decline in housebuilding after 1968, and a slowing-down in the rate at which building land became available. The precise timing of the inflation resulted from the sudden and large increase in the availability of building society mortgages. And as the inflation grew, so optimistic expectations helped to raise house prices still further. Any Government policy to ease the housing shortage and curb house-price inflation must expand house-building, whether the emphasis be placed on council housing or on the private sector.

Education.

Educational expenditure rose by no less than 183 per cent between 1960 and 1970, and accounted for 12 per cent of public expenditure in 1970. Over the decade enrolment in all schools in the United Kingdom increased by 15 per cent. In addition, expenditure rose because the more expensive types of education—secondary schools and universities—expanded more rapidly. University enrolment slightly more than doubled over the decade, reaching 220,000 in 1970. In that year there were also about the same number of people enrolled for advanced courses at polytechnics and other institutions of further education. More children stayed on at school after reaching the school-leaving age of 15. For instance, the number of children aged 15 and over at school in England and Wales rose from 14 per cent of the age-group 15–19 in 1960 to 24 per cent in 1970. This percentage increased again with the raising of the school-leaving age to 16 in 1972.

In December 1972 the Conservative Government published a White Paper setting out plans for the expansion of education over the next decade. More emphasis was to be placed on nursery schooling for the 3- and 4-year-olds: within 10 years it would be available to all children whose parents want them to attend. There would be a school building programme to replace the bad old school buildings. Teacher training would be expanded to reduce pupil-teacher ratios further. In 1970 there were on average 27 pupils per teacher in primary schools and 18 in secondary schools in England and Wales; but these averages covered a wide dispersion. Higher education would be expanded less rapidly than in the previous decade, and the emphasis would be placed on polytechnics and other non-university colleges. *See also* **Guide to Education, Section R.**

It is increasingly recognised that education can be an economic investment for the future just as much as capital formation in, say, machinery or roads. There is a "private return" on "investment in education", which takes the form of higher earnings over the lifetime of the person educated; and there is a "social return" on public resources devoted to education, being the greater contribution to the national product which trained and educated people can make.

Social Security.

There are two forms of social security: *National Insurance* and *supplementary benefits.*

(i) National Insurance.

Under this scheme employees receive rights to unemployment benefit, sickness benefit, retirement pensions, widows' benefits, injury and disablement benefits, etc. For instance, in 1972 370 thousand persons received unemployment benefit, 1·0 million received sickness benefit, there were 7·6 million retirement pensioners and 570 thousand receiving widows' benefits. Weekly rates are laid down for each benefit, *e.g.*, in 1974 a weekly rate of £8·60 was paid to a single person receiving unemployment benefit or sickness benefit. The basic rate was increased according to the number of dependants: £5·30 for one adult, so much for the first child, etc. In 1966 an earnings-related supplement was introduced for benefits paid to persons between 18 and 65 (men) or 60 (women); the supplement in 1974 being one-third of average weekly earnings between £10 and £30, and 15 per cent of any earnings lying between £30 and £48, and a maximum total benefit, including increases for dependants, of 85 per cent of earnings.

By far the most important benefit is the retirement pension, paid as of right to contributors on retirement. Individuals may increase their rate of pension by staying on at work after the minimum retiring age of 65 for men and 60 for women. In his 1974 Budget the Chancellor raised retirement pensions to £10 per week for single persons and to £16 for couples, as from July 1974.

(ii) The Financing of National Insurance.

The main source of finance for National Insurance payments is the National Insurance and Industrial Injury Funds; accounting for some £2,500 million in 1970. These funds are built up largely from the compulsory weekly National Insurance contributions which most of the adult population have to pay. For employees, both employer and employee pay a contribution. The self-employed also pay contributions of smaller size than the sum of the employer's and employee's contribution, but they are not entitled to unemployment benefit and one or two other benefits. Most non-employed persons, other than married women and the retired, have to pay still lower contributions and are entitled to even fewer benefits. Weekly contributions include a contribution to the cost of the National Health Service. Both ordinary and contracted-out workers pay a graduated contribution on their earnings between £9 and £54 per week to meet the cost of the earnings-related supplements introduced in 1966.

The National Insurance Scheme is an odd mixture of insurance and tax. The levels of contributions, when the scheme started in 1948, were fixed on the actuarial principle that contributions by or on behalf of an individual plus a specified State contribution should on average suffice to pay for the benefits to which he was entitled. But

the scheme did not allow for inflation and a rising standard of living, and a succession of increases granted in the rate of pensions has put an end to this actuarial probity. Instead the principle became established that the rate of contributions in each year, together with a minor transfer from the Government, should equal the total benefits paid out in that year.

(iii) Reform of Pensions.

A scheme for graduated pensions was introduced for employees in 1961. Under the scheme there are two kinds of employees—*ordinary* and *contracted-out*. In the case of contracted-out workers, their employer (on whom the decision whether to contract out rests) must institute a private superannuation scheme that gives at least as favourable terms as the new State scheme, including the provision that rights under the scheme should be transferable up to the limits of the State scheme. Transferability is the guarantee that the individual does not lose his pension rights when he changes his job. For ordinary workers the contribution now depends on earnings. Those earning less than £9 a week pay a flat-rate contribution, which is lower than that paid by contracted-out workers. Those earning more than £9 pay in addition a percentage of the amount by which earnings exceed £9 up to a limit of £54 and in return receive the right to an increased pension on retirement.

In 1969 the Labour Government made proposals in a White Paper to replace the National Insurance Scheme by a new scheme of superannuation and social insurance, in which both contributions and benefits would be related to the earnings of the individual. It argued that the existing scheme failed to provide security in old age. The new earnings-related contributions would be mostly higher than contributions under the existing scheme, especially among higher earners; and in return higher pensions and other benefits would be paid. Twenty years of new scheme contributions would be required before the first pensions at the full rates were paid.

An important feature of the proposed scheme was that benefits were to take into account both changes in prices and in general living standards. Thus, for instance, a contributor who received earnings equal to the national average throughout his working life would receive a pension calculated on the national average earnings at the time he reached pension age, not on the money he received over his working like. Some two-thirds of employed men were contracted out, *i.e.*, in occupational pension schemes, in 1970. The Government intended that these schemes should continue to exist together with the State scheme, and it proposed to allow for partial contracting out of the State scheme.

These plans lapsed with the change of Government in 1970. The Conservative Government announced its proposals for reform in a White Paper published in 1971. It considered that the costs of earnings-related benefits would be too great; instead it favoured earnings-related contributions for basically flat-rate pensions. In addition it wished to encourage contracting out, so that almost all employees would also be members of a private occupational pension scheme, in which pensions would be related to past contributions. The Government recognised that it would have to ensure that occupational pension rights were transferable between jobs. Like the previous Government, it envisaged a legal guarantee that State pensions would be revised every two years. It also envisaged that the share which the State provides from taxation for National Insurance—about 18 per cent of contributions in 1970—would be maintained.

(iv) Poverty in Britain.

Despite the existence of National Insurance there are many people in Britain whose income falls below that which the Government regards as adequate. These people are supported from Government revenues by means of *supplementary benefits*, before 1966 known as *National Assistance*. It is a fault of the National Insurance Scheme that so many have required this assistance. In 1970 there were no less than 2·7 million recipients of supplementary benefits, of whom over two-thirds —1·9 million—were persons over pension age. Another 320 thousand were sick and disabled, 240 thousand unemployed and 190 thousand women with dependent children. Including dependants, no less than 4·2 million people benefited. Just over a quarter of those on National Insurance retirement pensions also received supplementary benefits.

Supplementary benefits ensure that a certain minimum weekly income is maintained: in 1970, in the case of a single pensioner £5·70, a pensioner couple £9·50, and an unemployed man with wife and children aged 4 and 7, £11·80. In addition an allowance for housing expenditure is paid. The operation of social security is illustrated in the following example, utilising the data and regulations in force in 1970. Take a worker earning the average weekly gross earnings for adult male manual workers in manufacturing in 1970: £28·05. Assume that he has a wife and two children aged under 11. While he is working his gross income is reduced by National Insurance contributions and income tax, and supplemented by family allowance; his net income being £23·19. If he becomes unemployed or sick, he receives National Insurance benefit, including an earnings-related supplement, and family allowance; his net income being £16·85. But after 6 months the earnings-related supplement lapses: he receives only £11·20 in National Insurance benefits, and is eligible for supplementary benefits to raise his income to £11·80 plus an allowance for housing expenditure.

Public Revenue.

We see from the table that, of the sources of revenue, personal income tax, National Insurance contributions and taxes on capital were the most buoyant over the decade. Not less than 47 per cent of the total public revenue in 1970 came from taxes on income; more than half of this being personal income tax. Taxation of profits amounted to only 5 per cent of total public revenue. Taxes on expenditure accounted for 30 per cent of the total. It is interesting to note the growing importance of *direct taxation* (taxes on income) relative to *indirect taxation* (taxes on expenditure on goods and services) over the decade.

Two commodities in particular were heavily taxed: alcoholic drink and tobacco. Together they accounted for almost 10 per cent of public revenue. These commodities are singled out partly for social reasons and partly because—in economists' jargon—the demand for them is *inelastic*; *i.e.*, the public reduces its consumption of drink and tobacco only slightly in response to a rise in their price. Indirect taxation—taking the form of excise duties and purchase taxes—was spread unevenly over the different sorts of expenditure. In 1970 taxation increased the price of cigarettes by 203 per cent; drink by 69 per cent; consumer durables such as cars by 26 per cent; the running of cars (*e.g.*, petrol) by 93 per cent: clothing by 10 per cent; and food hardly at all. For goods and services in general, tax raised prices by 23 per cent on average. The introduction of Value Added Tax in 1973 tended to even out the incidence of indirect taxes on different goods and services (*see* G50).

The Budget.

Each year in April the Chancellor of the Exchequer announces his Budget for the coming fiscal year. The most important and most difficult task in drawing up the Budget is to decide on the size of deficit to aim for. The deficit is the excess of public expenditure over public revenue; and it has to be financed by borrowing from the private sector. A large deficit is reflationary: sometimes that may be required to get the economy out of recession. A small deficit—and even more a surplus—is deflationary, and is a means of holding a demand-pull inflation in check (*see* G20).

The calculation of the precise deficit or surplus needed is a chancy business; for the level that is required depends on the amount of saving and on the amount of spending out of credit that people intend to do—and this is not easily predictable. It also depends on the change in the foreign

SOURCES OF PUBLIC REVENUE

Total expenditure	9,400	21,564		

balance. Nor can the Chancellor be sure his figures are right: estimating next year's revenue, and even next year's expenditure, by the Government is difficult enough, but he needs to estimate also the likely trends of private income and expenditure, without really reliable information as to what they were in the past year.

Nevertheless, fiscal policy—running large deficits when economic activity is low, and small ones when it seems to be excessively high—is the most important action through which the economy can be kept on an even keel. Monetary policy may help; but the Budget decision of the Chancellor on changes in taxation and public expenditure is the key one.

6. SOURCES OF STATISTICS, AND SOME SUGGESTIONS FOR FURTHER READING

The non-specialist will find that most of the statistics he needs are given in the *Annual Abstract of Statistics*, published every year by Her Majesty's Stationery Office. This comprehensive document includes figures on population, social conditions, education, labour, production, trade and balance of payments, national income and expenditure, wages and prices, and many other topics. For more up-to-date information, reference should be made to the *Monthly Digest of Statistics* which has a similar coverage and gives month-by-month figures. A selection of the more important series, presented in a manner which can more easily be understood by the layman, is given in another Stationery Office publication, *Economic Trends*, also issued monthly.

Even greater detail is given in various other Government publications, e.g. in the Blue Book on *National Income and Expenditure*, published annually; and the *Balance of Payments* White Paper, published twice a year. Fuller information on labour problems is given in the *Employment and Productivity Gazette*, on trade in *Trade and Industry*, and on financial matters in the *Bank of England Quarterly Bulletin*. These three periodicals include discussions on the statistics presented. An important new Government annual publication in 1970 was *Social Trends*, containing articles and detailed statistics on social and economic conditions in Britain.

For an analysis of developments in the economy see the official *Economic Report*, published just before the Budget by the Treasury, and the *Economic Review*, a private publication issued by the National Institute for Economic and Social Research. To explain economic events and policy the Treasury publishes a monthly *Economic Progress Report*, available free of charge to the public.

For a scholarly critique of Government economic policy see J. C. R. Dow, *Management of the British Economy* 1945–60 (Cambridge University Press). An excellent, North American, survey of the British economy is found in the Brookings Institution Report, *Britain's Economic Prospects*, edited by Richard E. Caves (George Allen and Unwin). Easier to read than these books is S. Brittan, *Steering the Economy* (Penguin).

An entertaining account of economic ideas and their application is found in Michael Stewart, *Keynes and After* (Penguin Books). Other Pelicans include Joan Robinson, *Economic Philosophy*, and J. Pen, *Modern Economics*. A thorough explanation of international monetary affairs is given in Fred Hirsch, *Money International* (Allen Lane). E. J. Mishan in *Growth: The Price We Pay* (Staples Press) produces an interesting criticism of economists' and politicians' "obsession" with economic growth and affluence.

Readers with an appetite for economic theory may wish to try the introductory books *Economic Theory* by G. B. Richardson (Hutchinson University Library) and *Introduction to Positive Economics* by R. G. Lipsey (Weidenfeld and Nicolson).

III. THE UNDERDEVELOPED ECONOMIES

Income Levels.

Two-thirds of the world's population live in dire poverty—a poverty which can scarcely be imagined by those accustomed to the standards of living attained in the relatively few developed countries of the world. The orders of world inequality may be seen from the table comparing annual income per capita by region, converted into pounds sterling at official exchange rates. These figures are only very approximate because exchange rates are misleading indicators of purchasing power and because the averages conceal considerable income inequalities within some regions and countries. Nevertheless, it is clear that poverty is widespread in the world. The alleviation of this poverty is widely recognised as the most important economic—and indeed political—task of the second half of the twentieth century.

Peasant Agriculture.

"Underdeveloped" (or "developing" or "less developed" or "poor") countries have predominantly agricultural economies, and peasant *subsistence agriculture* is widespread. In

subsistence agriculture the primary object is to produce the food for your own family. Primitive tools and techniques of cultivation are used, and the margin between what can be produced and what is required to support life is narrow: the failure of crops because of drought, or the destruction of crops by floods or pests, can lead to famine unless food is quickly supplied from outside the area affected.

Agricultural production may be kept down by a shortage of land, or by a lack of farming knowledge and skills, or by a lack of funds for investment in land improvements or machinery, or by an unjust system of land tenure which deprives the farmer of incentive to raise his production. In many underdeveloped countries there is considerable potential for increasing agricultural output; but before such increases can be achieved new skills

NATIONAL INCOME PER CAPITA BY REGION, 1968.

	(£ p. a.)
North America	1,440
Oceania	655
Europe	600
Latin America	155
Middle East	120
Africa	55
Asia (excl. Japan)	40

have to be mastered and different techniques of production introduced, investment funds have to be provided, and—in some countries—there must be land reform. If power lies in the hands of landlords and money-lenders who favour the *status quo*, political change must come first.

The Population Problem.

In many underdeveloped countries there is population pressure on the land and much underemployment in the sense that people have insufficient work to keep them occupied for more than part of the day or year. With the application of modern methods of disease control—*e.g.*, the eradication of malaria through DDT spraying—death rates have tended to fall, while birth rates have remained high. Birth rates are kept up by such factors as tradition, social prestige, religion, the need for security in old age, and a lack of facilities for family planning. In consequence, many underdeveloped countries are experiencing an unprecedented population explosion: annual rates of increase of between 2 and 3 per cent, which double population in as little as 35 and 24 years respectively, have been recorded.

POPULATION SIZE, GROWTH AND DENSITY BY REGION

	Population 1970 (m).	Growth rate 1963–70 (% p.a.).	Density 1970 (per sq. kilo).
North America	228	1·3	11
Europe	462	0·8	94
U.S.S.R.	243	1·1	11
Oceania	19	2·1	2
Africa	344	2·5	11
Latin America	283	2·9	14
Asia	2,056	2·3	75
World Total	*3,632*	*2·0*	*27*

The table indicates that over half of the world's population lives in Asia, and that the developed regions account for under a third of the total. Apart from Australasia (into which immigration is high) the developed regions show slower rates of population growth than Africa, Latin America, and Asia. The figures of population density may easily be misinterpreted, since they take no account of the nature of the area, *e.g.*, deserts and lakes are included. But it is clear that Asia is more densely populated than Africa or Latin America. Population density is a hindrance only in agricultural economies: because it is industrialised and has accumulated much capital, Europe can support at a high standard of living a population more concentrated even than that of Asia.

As a result of rapid population growth the pressure of population on the land has increased, particularly in Asia. Less productive land has been brought into cultivation, and erosion and loss of fertility have become major problems. A substantial increase in output is required to prevent a fall in per capita income as population grows, and an even greater increase is required if living standards are to be improved. Between 1960 and 1970 food production in the developing countries as a group increased by 31 per cent. but per capita food production rose by only 2 per cent. Even in those countries with plenty of land a rapid increase in population diverts scarce investment resources away from directly productive investments such as factories and irrigation projects so as to meet the needs of the expanding population for more schools, hospitals, housing, cities, and other public services.

International Trade.

Almost all underdeveloped countries export primary products (foodstuffs, industrial raw materials, and minerals) and import manufactured goods, especially the capital goods (plant, machinery, and vehicles) required for development. This international division of labour has recently operated to the disadvantage of the underdeveloped countries. The world demand for their primary products has increased only very slowly. This is because people spend just a small part of their additional income on food (*e.g.*, tea, coffee, cocoa), because synthetic substitutes have been developed for many raw materials (*e.g.*, rubber, cotton, jute), because developed countries protect their own agriculture (*e.g.*, sugar) and because demand in the developed countries has moved towards commodities with low raw material content (*e.g.*, from heavy industries to services). In consequence, the general trend has been for the prices of primary products to fall. This was an important cause of the improvement in Britain's terms of trade (*see* G6). The reverse of the coin was a deterioration in the terms of trade of many underdeveloped countries, *i.e.*, they could now buy fewer imports for a given quantity of exports. Primary commodities exported by developing countries decreased in price on average by 12 per cent over the period 1957–62, and increased by only 2 per cent between 1962 and 1970. Over the period 1953–70 their terms of trade worsened by 12 per cent. This contributed to the shortage of foreign exchange which restricts investment expenditures in many underdeveloped countries. Most poor countries benefited from the soaring prices of various commodities in world markets during 1972 and 1973. However, many such as India, were net losers as a result of their dependence on imported oil (*see* G36).

The prices of various primary products tend to fluctuate violently from one year to another. Many underdeveloped economies depend heavily on the exports of one or two commodities. For instance, coffee is the most important product in Brazil, cotton in Egypt, copper in Zambia, sugar in Cuba, cocoa in Ghana, and rice in Burma. Fluctuations in the world price of its main export cause instability in the export revenues of a country, and this in turn can produce fluctuations in income throughout its domestic economy.

Industrialisation.

In those underdeveloped countries where there is population pressure on the land, alternative employment has to be created in industry or services. Even in countries with a surplus of land, if there is heavy dependence on one or two primary products, industrialisation provides a means of diversifying the economy.

But industrialisation is not an easy course. Because the margin between agricultural production and food consumption is narrow, the surplus from the agricultural sector exchangeable for the products of other sectors—*e.g.*, industry

and services— is small; *i.e.*, the demand for the goods and services produced by other sectors is low. A second constraint on industrialisation is imposed by competition from abroad; new industries in an underdeveloped country have to compete with established industries in developed countries, which have the advantage of experience, a trained labour force, and markets big enough for them to reap all the potential economies of large-scale production. On the other hand, underdeveloped countries with their relatively cheap labour may have an advantage in the production of simple labour-intensive products: witness the success of Hong Kong in exporting textiles and plastic products to the developed countries.

Underdeveloped countries can of course take advantage of the technical advances made in the developed countries. But this is not without its drawbacks. Even in countries with cheap labour the most profitable techniques of production in industry are normally highly capital-intensive, so that the amount of investment funds required to equip a worker is often enormous and the amount of employment provided in meeting the local demand for a manufactured product is often small. Hence the argument for developing an *intermediate technology* which is both profitable and suited to the needs of the underdeveloped countries.

Educated Manpower.

Many underdeveloped countries are faced with the dual problem of unskilled labour surpluses and scarcities of skilled and educated manpower. The problem is particularly acute in some of the recently independent countries of Africa. To give an extreme example: at the time of its independence in 1964, Zambia had only 100 Zambian university graduates and 1,200 secondary school graduates in a population of 3·5 million. In such countries the great shortage of educated and skilled people enables them to earn high incomes—with the result that there is a very unequal distribution of income. And even in countries where surpluses have developed, the existence of an international market for professional people like doctors and engineers helps to keep up their earnings: these countries suffer from a "brain drain" to the developed world.

Because teachers are educated people, education in underdeveloped countries can be very expensive. In Uganda in 1965 only 45 per cent of the children in the relevant age-group were at primary school and only 2 per cent were at secondary school. Yet the salary bill paid to their teachers exceeded 2 per cent of the gross domestic product. In such circumstances it is difficult to meet the demands for universal primary education; especially if the sort of primary education provided does not enable children to become better farmers.

Economic development is not just a matter of capital accumulation: it requires also an increase in educated manpower. Not only more knowledge but also new habits and attitudes—*e.g.*, attitudes towards risk-taking, hard work, and thrift. Education—of the right sort and with suitable content—is generally acknowledged to be important for development, although the benefits of education cannot be quantified at all satisfactorily.

Economic Aid.

The gap between living standards in the underdeveloped areas of the world and in the areas already developed has tended to widen in recent years. In the 1950s real income per capita rose in the developed countries by 2·7 per cent per annum on average, and in the underdeveloped countries by 2·3 per cent per annum. It was through a growing world recognition of this situation that the 1960s were designated "The United Nations Development Decade." But between 1960 and 1970 these rates of growth widened to 3·8 and 3·0 per cent per annum respectively. World inequalities increased despite a larger flow of economic assistance from the richer to the poorer nations. The total net flow of economic assistance from Western industrial countries to the developing world was over £6,500 million in 1970. Roughly £3,200 million of this was net private investment, and £3,300 million official Government aid. But whereas total aid increased rapidly in the 1950s, the increase was not so rapid in the 1960s: indeed, in real terms total aid in 1966 was lower than the estimate for 1961. Almost half of the official Government aid in 1970 was contributed by the United States: the other principal donors were France, West Germany, Japan and Britain, in that order.

Aid to underdeveloped countries takes many forms, it serves many purposes, and it is given for many reasons. Underdeveloped countries need aid to provide finance for development projects; to provide foreign exchange with which imports for development purposes can be bought; and to provide the trained manpower and technical knowledge which they lack. The motives of the donor are not always humanitarian. "Aid" can take a military form; it can be used to prop up an incompetent or unjust government, or to buy support in the cold war. Nor is aid always beneficial to the recipient country. It may be wasted on ill-conceived or prestige projects, or cause the Government simply to relax its own efforts. Sometimes schools or hospitals are built with aid but there is a lack of local revenues with which to staff and run these institutions. Concern over donors' motives and instances of waste has led some people to react against aid-giving. However, the correct remedy is not to cut off aid but rather to prevent its misuse.

Donor governments may finance specific projects, or they may contribute to the general pool of funds available for expenditure by the governments of underdeveloped countries. But financial aid is not always enough. Most underdeveloped countries need technical assistance in planning their development, to ensure that development possibilities are exploited and that scarce resources are used to best advantage. Hence the many schemes for providing experts by individual countries and by the technical agencies of the United Nations, such as the Food and Agriculture Organisation (FAO), the World Health Organisation (WHO), the International Labour Organization (ILO), the United Nations Educational, Scientific, and Cultural Organisation (UNESCO), the Technical Assistance Board (UNTAB) and so on. Hence also the schemes for educating and training people from the developing countries in universities and colleges in the developed countries.

Foreign Private Investment.

One possible form of aid is private investment by firms from developed countries. These investments—setting up branch factories, for example—are concentrated in those projects which appear profitable to the investor. However, it is a characteristic of underdevelopment that there are few openings for profitable investment. Most of the U.K. private investment overseas, for example, has been concentrated in relatively highly developed countries of the sterling area. Private investment cannot be relied upon to provide an adequate flow of aid.

Indeed, it has been questioned whether private investment constitutes aid to less developed countries at all. Its opponents argue that the benefits are often small or even negative: foreign-owned firms repatriate high profits and avoid tax by means of royalty payments to the parent company or unrealistic pricing of their transactions with the parent company; and these firms deter local enterprise. Supporters of foreign investment point to the high political risks which necessitate high profits in order to attract investors to developing countries, and question whether resources are available for any alternative path to development.

The International Bank.

The International Bank for Reconstruction and Development (IBRD) known as the *International Bank* or as the *World Bank*, is an agency of the United Nations established in 1945. It has the primary function of making funds available to assist underdeveloped countries. Member nations agree to subscribe quotas—fixed in much the same way as the quotas for the IMF—to the Bank. In fact, only a small proportion of the quotas has been called up by the Bank; the major part of the

Fund's resources are borrowed—on the security of the remainder of the quotas—in financial centres: particularly in New York, but also in London and elsewhere.

Usually, loans are made to finance specific projects of investment in underdeveloped countries; and the Bank will normally make a loan only if it is satisfied that the investment will yield a revenue sufficient to enable the payment of interest on the loan, and the repayment of the sum lent. In 1970 the Bank made loans to the value of about £700 million. Thus a sizeable amount of lending is channelled through the Bank, but it is clear that some projects of great value to underdeveloped countries cannot be financed in this way, because they would not yield returns quickly or large enough to meet the Bank's stringent requirements for interest and repayment. Accordingly a new institution, the *International Development Association*, was set up in 1960 with the power to make loans at low rates of interest and with more recent years. It was fairly constant before 1957/8 but more than tripled to £213 million in the decade following 1957/8. Aid *per capita* of the British population nearly tripled, and amounted to £4·20 per head in 1970/1. However, when aid is expressed as a percentage of the gross national product (GNP), we see that the percentage rose from 0·33 of 1 per cent in 1957/8 to 0·65 of 1 per cent in 1960/1, remained at that level until 1966/7 and then fell. To be just 1 per cent of GNP, aid would have to be raised by about £200 million. Aid may be divided into multilateral aid and bilateral aid. Multilateral aid is given through the medium of the international institutions such as the IBRD and the IDA; bilateral aid is given directly to the developing countries. Multilateral aid was still only £42 million in 1972/3. The increase in aid since 1957/8 has taken place in bilateral aid. Whereas loans were fairly negligible in 1957/8, they increased rapidly, and exceeded grants from 1964/5.

BRITISH GOVERNMENT AID, 1957/8 TO 1972/73.

Fiscal year	Total aid			Multi-lateral aid £m.	Bilateral Aid		
	£m.	per capita £	as per-centage of GNP		Total £m.	Grants £m.	Loans £m.
1957/8	65	1·3	0·33	3	62	50	12

1972/3	293	5·2	0·50	42	251	111	140

generous repayment conditions. The IDA contributes (but only on a limited scale) towards the development of education and agriculture.

Unctad.

In 1964 the United Nations Conference on Trade and Development (UNCTAD) was held. For the first time the poorer nations of the world—77 were represented—came together to act as a pressure group on trading matters. The Conference made the following recommendations. Developing countries should be given freer access to world markets for their manufactures and semi-manufactures by the elimination of quotas and tariffs. International commodity agreements should be made for each major primary commodity in world trade, to stabilise commodity prices. Compensation schemes—whereby countries are compensated for the declining prices of their primary products—were recommended for consideration. The conference also resolved that the developed countries should aim to provide at least 1 per cent of their national income as aid for the underdeveloped countries.

Nothing concrete resulted from the 1964 Session: no significant trade measures in favour of the developing countries were taken, and the international transfer of financial resources diminished in relation to the income of the developed countries. A second Session of the Conference was held in 1968. Again, no action resulted from the Session; but the developed countries did accept more firmly the principle of discrimination in favour of developing countries in trade and shipping, and the 1 per cent target for aid. Progress was subsequently made in introducing tariff preferences on poor countries' exports of some manufactures to rich countries.

UNCTAD III, held in Chile in 1972, appeared to be more a political tournament than a constructive Conference. Perhaps the most promising outcome was the greater likelihood of a future *Link* between SDRs and international aid; *i.e.* the issue of the new international paper currency to less developed countries—so easing the problems both of international liquidity and of development (*see* G37).

British Aid.

The table shows how British Government aid to underdeveloped countries has increased in

It must be remembered in deciding the terms on which Government aid is provided, that the foreign indebtedness of the developing countries is increasing sharply. Over 80 per cent of British loans are made available for 20 years or more. Sometimes the British Government charges a rate of interest on its loans equal to the rate at which it can borrow on the capital market. Interest was normally charged in the early 1960s, but no less than 70 per cent of the loans made in 1972 were interest-free. About a third of expenditure on aid is formally tied to the purchase of British goods and services. Other aid is not tied formally, and may be used directly to finance local expenditure; but when it is used to finance imports directly, it has to be spent on British goods if these are available on competitive terms. Multilateral aid is untied. The tying of aid tends to raise the costs to developing countries; but it also onables countries with precarious foreign balances—such as Britain—to be more generous.

Aid takes the form not only of financial but also of technical assistance. To co-ordinate and promote technical assistance the Department of Technical Co-operation (DTC) was set up in 1961. British Government expenditure on technical assistance amounted to £60 million in 1972. At the end of 1972 British technical assistance personnel overseas totalled altogether 11,500 (excluding volunteers recruited by voluntary societies); over 1,000 administrators, 5,300 teachers, 1,100 agricultural advisers, 2,200 industrial and communications advisers, and 800 doctors and medical workers.

In 1964 the Labour Government established an Overseas Development Ministry (ODM), through which all British aid was channelled and co-ordinated; in 1970 the Conservative Government absorbed the ODM into the Foreign Office, but it was re-established by the incoming Labour Government of 1974. The amount of aid which ought to be provided has become a political issue in some countries such as the United States: thankfully a strong anti-aid lobby has not emerged in Britain.

Some Suggestions for Further Reading.

For an introduction to the subject the reader is referred to Jagdish Bhagwati, *The Economics*

of Underdeveloped Countries (World University Library). A recent book concerned with international disparities, and addressed to the general reader, is *Development in a Divided World*, edited by Seers and Joy (Pelican). An interesting account of life in rural India is found in Kusum Nair, *Blossoms in the Dust* (Duckworth). On Asia the reader may wish to dip into the three volumes of Gunnar Myrdal entitled *Asian Drama: An Enquiry into the Poverty of Nations* (Alan Lane, The Penguin Press). A helpful introduction to African problems is found in Andrew M. Kamarck, *The Economics of African Development* (Praeger). On South America there is Celso Furtado, *Economic Development of Latin America* (Cambridge University Press).

The Overseas Development Institute has published a number of pamphlets on aid topics, including *World Development Handbook*, *British Development Policies*, and *Volunteers in Development*. The Ministry of Overseas Development has compiled a handbook of *British Aid Statistics* (H.M.S.O.). The Report of the Commission on International Development, *Partners in Development*, (the Pearson Report 1969) reviews the problems of the less developed countries and makes recommendations for their solution by means of aid policies. The Organisation for Economic Co-operation and Development, comprising all the major non-communist developed countries, publishes an Annual Review of aid and development entitled *Development Assistance* (O.E.C.D.).

IV. RECENT DEVELOPMENTS IN THE BRITISH ECONOMY

1. INTERNATIONAL DEVELOPMENTS

The Balance of Payments.

The balance of payments problem has dominated events in the British economy since 1960. It is therefore important to analyse the balance of payments in some detail, to understand the circumstances which led to the devaluation of the pound in 1967, the improvement in the balance of payments after 1968, and its subsequent deterioration despite further devaluation; and to understand the effects of these movements on economic policy. The balance of payments and its components are explained in detail on G6–8. The balance of payments in each year since 1960 is shown in the table below.

Developments up to 1964.

There was a rapid deterioration in the current balance of payments between 1959 and 1960. The main cause was an upsurge in demand, which affected imports in three main ways: higher incomes meant higher demands for imported goods; stocks of imported goods were run down in 1959 and replenished in 1960; and when productive capacity at home became strained, some goods were imported to supplement home supplies. No doubt imports will increase as the economy expands; but it can be argued that sudden and very rapid bursts of expansion, as in 1959–60, will have a much greater effect on imports than would a steadier and more sustained growth.

In the following two years imports were steady at about the 1960 level: the internal economy was relatively stagnant, partly because restrictive measures had been adopted to curb demand at home and to protect the balance of payments. Imports were sharply up by over £250 million in 1963 with the rapid expansion of national expenditure, but there was a slightly larger increase in the value of exports.

There was a fairly steady official long-term capital outflow in the 1960s and a less steady net private investment abroad. Most volatile were the monetary movements. For instance, there would have been a large deficit in the currency flow in 1960 had it not been for a substantial inflow of short-term funds (*i.e.*, additions to our short-term liabilities). The sterling balances rose by an unprecedented amount, largely as a result of speculation against the dollar, based on fears that it might be devalued. So great was the inflow that there was a curious combination of a very large *deficit* on current account and a substantial *rise* in our reserves of gold and convertible currencies.

The dangers inherent in the financing of deficits through additions to short-term liabilities were vividly demonstrated the following year. Much of the funds which moved in during 1960 was moved out again before July 1961 in a wave of speculation against sterling. The outflow was financed partly by running down reserves of gold and convertible currencies between end-1960 and July 1961, and partly through the Basle agree-

* A plus sign denotes a rise in liabilities or a fall in assets, and a minus sign a fall in liabilities or a

ment under which European central banks undertook to build up short-term holdings in centres (London in this case) from which funds were being withdrawn. The rapid drain on the reserves had to be stopped; and the European central banks were not prepared to see their sterling holdings rise much higher. So in July 1961 a series of crisis measures—including the raising of Bank Rate to 7 per cent—were taken, primarily to protect sterling. In addition, arrangements were made to withdraw over £500 million from the IMF with provision for further credits if necessary (*see* G9 and 10). In 1962, speculative movements of funds were much less violent. Aided by a substantial improvement in the current balance of payments, Britain was able to complete repayments of its IMF drawing. These repayments did, however, involve a drain on the reserves; and this explains the substantial fall in the reserves over the year.

The 1964 Crisis.

Imports in 1964 were some £640 million higher than in 1963, whereas exports were up by less than £200 million. The remarkable increase in the value of imports cannot be explained simply as a rise in import prices: imports increased by 15 per cent in value and by 11 per cent in volume. Nor can it be seen merely as a response to the expansion of the economy: if imports had done no more than rise in line with output, they would have increased in volume only by about 4 per cent. Part of the explanation lies in the fact that importers were stockbuilding after the depletion of raw material stocks during the boom of 1963. More important, however, is the fact that imports of manufactured goods rose by 28 per cent, or two-thirds of the total rise in import value. This leads us to the conclusion that home producers were losing ground in the British market to foreign competitors. In the same way, the disappointing performance of exports was due, not to lack of overseas demand—world trade in manufactures rose by about 15 per cent in 1964—but to the diminishing competitiveness of British products.

(i) Remedial Measures.

The timing of Government action on the balance of payments position was influenced by the General Election of mid-October. The out-going Government had been concerned with the impending Election, and argued that the deficit was abnormal and could be expected to improve without remedial action. On taking office, the new Government decided that immediate remedial action was necessary. Three courses were possible. It could devalue the poun and so improve the competitive position of British exports and import-substitutes (*see* G8). But a devaluation was seen to have disadvantages. The price of necessary imports would be increased and this would lower the British standard of living; the ensuing wage demands would make it more difficult to implement an Incomes Policy—which is an alternative method of improving the British competitive position in world markets (*see* G46–9). Furthermore, the devaluation of the pound might have necessitated the devaluation of other currencies including the dollar: this would have defeated the purpose of the devaluation. These real arguments against devaluation are not to be confused with the spurious argument that devaluation is somehow morally wrong. A second possible course of action was to reduce imports to a satisfactory level by the deflation of the economy. However, national income would have to fall by a multiple of the required cut in imports. Deflation was rejected because it would cause unemployment and because it was considered to provide only a short-term solution to Britain's economic problems: somehow the foreign imbalance had to be corrected without impeding the growth of output and productivity. A third course of action was to impose import controls or tariffs and export subsidies. Import controls were rejected: for one reason, it would take time to set up the necessary administrative machinery. So it was that the Government decided upon an additional import tariff and an export subsidy.

Within two weeks of coming to power, the Government announced its measures (which had in fact been investigated by the previous Chancellor). There was to be an immediate but temporary surcharge of 15 per cent on all imports of manufactures and semi-manufactures: the more necessary imports such as foodstuffs and basic raw materials were excluded. A new system of export rebates was introduced, representing the indirect taxes paid in Britain by British exporters, mainly duties on oil, petrol, and vehicle licences. The value of the rebate averaged 1½ per cent of the value of exports. The import surcharge was critically received by the other EFTA members; it clashed with their objective of eliminating all tariffs by the end of 1966. The Government defended its action to the GATT Council in terms of an article in the Treaty which allows parties in balance of payments difficulties to resort to tariff restriction (*see* G8). Regrettably, the GATT Council declared the import surcharge a violation of the Treaty.

(ii) Speculation Against Sterilng.

The large deficit in non-monetary capital flows in 1964 of £350 million was as remarkable as the deficit on current account. The outflow was due to an increase in private investment abroad; there

1960–73 (£ MILLION)

rise in assets.

was no increase in net Government lending. Part of the net private capital outflow in the first half of the year may have been abnormal and part in the second half of 1964 may have been related to the growing current account deficit: portfolio investment in this country was not an attractive proposition, and foreign firms tended to repatriate any funds available.

There was a net monetary capital inflow in the first half of 1964, which financed the growing overall deficit. The crisis arose in the second half of the year, when an outflow of short-term capital —a "flight of hot money"—took place in expectation that a British devaluation would be necessary to cure the worsening imbalance. To protect the reserves, the IMF granted Britain a stand-by credit of £330 million. However, once the feeling developed that the pound would have to be devalued, the process became cumulative: the greater the outflow the more likely it seemed that Britain would be forced to devalue. A great deal of sterling was offered for sale by speculators holding pounds—the "Gnomes of Zurich"—and by British and foreign importers and exporters. In order to prevent the price of sterling from falling below the official minimum limit to the exchange rate of £1 = $2·78 (*i.e.*, to "support sterling") the Bank of England was itself forced to buy pounds. To do this the Bank had to draw on the country's reserves of gold and foreign exchange. The vast drain on the reserves could not be allowed to continue, and in late November, Bank Rate was raised by 2 per cent to 7 per cent. The aim of this measure was to lure back short-term capital funds with the high rate of interest, and also to convince speculators that the pound would not be devalued. Speculators were not convinced, however, and the crisis continued. Two days later it was announced that an enormous loan totalling £1,070 million would be made available to Britain from all the leading Western central banks. This news was sufficient to slow down the speculative outflow, and by the close of 1964 the selling had come to an end.

Events Leading to Devaluation.

Imports increased a good deal more slowly than output in 1965; rising by only 1 per cent. This was partly because the stockbuilding of 1964 had come to an end, and partly because the import surcharge held back imports of manufactured consumer goods. The value of exports was 7 per cent higher in 1965 than in 1964, and their volume 5 per cent higher. Thus the current deficit was more than halved, from the record of £400 million in 1964 to just over £100 million in 1965. The deficit on capital account was also cut considerably. Nevertheless, an overall deficit in total currency flow amounting to £350 million in 1965 had to be financed by monetary movements.

The trade balance showed little improvement by mid-1965, and in the third quarter fear of devaluation led to yet another run on sterling, probably as severe as that of November 1964. The Government was again forced to draw on the IMF and to borrow from the United States Federal Reserve Bank. This time, however, the extent of speculation against the pound was successfully concealed. When the trade balance improved rapidly in the second half of 1965, the speculation died away.

However, this progress did not continue into 1966, and confidence in the pound was further upset by the seamen's strike in May and June. Yet another flight of short-term capital occurred; and this led the Government in panic to introduce a policy of deflation, in a package-deal known as the "July measures" (*see* **G41**). Only two measures improved the balance of payments directly: a reduction of the personal travel allowance outside the sterling area to £50 per annum and a proposed cut in Government overseas spending. The fall in demand resulting from the deflationary policy, together with a wage-freeze introduced at the same time (*see* **G47**), improved the trade balance and actually turned it into a surplus at the end of 1966. But it should be remembered that this improvement was achieved only at the cost of some unemployment of men and machinery and a slower rate of economic growth.

Imports rose in value by over 6 per cent and exports fell in value by nearly 2 per cent between 1966 and 1967. Thus the trade gap which had almost closed in 1966 widened to a record level in 1967. The rise in imports cannot be explained simply by the rise in demand, as incomes rose by only 1 per cent between the two years: the "July measures" were taking effect. One reason for the surge in imports was the removal of the temporary import surcharge in the preceding November, which caused a postponement of purchases until 1967, and reduced the price of imported goods competing with British products. Other reasons were the building up of imported stocks which had been depleted, and the Middle East war in June, which raised the price of essential oil imports. The main reason for the fall in exports was the exceptionally slow growth of world production in 1967: demand in the countries importing British goods was fairly stagnant. Exports were also hit by the dock strikes in September. The deficit in total currency flow over the year was £670 million, of which perhaps £200–400 million was due to speculation. With the trade returns deteriorating, sterling came under almost unremitting speculative pressure from the end of May onwards, reaching a climax in November.

Devaluation of the Pound, 1967.

The Government recognised that action would have to be taken to improve the balance of payments, and to obtain further foreign loans to protect the depleted reserves. The same alternatives were open as in 1964: deflation, import controls, tariffs and devaluation (*see* **G33**). Simple deflation to reduce imports was ruled out politically as the economy was now already in recession. Import controls and tariffs would meet with resistance from Britain's competitors and the GATT, and tariffs had been tried in 1964 without success. The Government decided to devalue the pound.

The case for devaluation is a mixed one (*see* **G8** and **33**). It makes imports more expensive relative to home-produced goods, and so demand for manufactured goods shifts away from imports; but in the case of food and raw materials, Britain must continue to import these essentials at the higher price because there are no domestic substitutes. It is possible, therefore, that devaluation will actually raise the import bill. However, export receipts should be increased by a greater amount: Britain exports its products in a highly competitive market, so that the reduced price of British goods in terms of foreign currencies should lead to a considerable increase in the amount of exports.

This improvement in the trade balance depends on Britain being able to retain at least part of the price advantage gained by devaluation. However, since devaluation raises the price of imported goods, it raises the cost of living both directly and indirectly, *e.g.*, imported raw materials rise in price, so increasing production costs, which are passed on as higher prices. The trade unions react to this cut in the standard of living by demanding wage increases. In this way a spiralling inflation can occur which entirely neutralises the gain from devaluation. Devaluation makes an incomes policy both more difficult and more important (*see* **G46–9**).

On November 18, 1967, the pound was devalued by 14·3 per cent, from $2.8 to $2.4 to the £. Devaluation was anticipated by speculators, and on the day before, there was a run on the pound said to be greater than any previously experienced. The devaluation was unfortunately delayed by the need to achieve international co-operation so as to prevent a flurry of competitive devaluations. As it was, only a few minor currencies—including those of Denmark, Hong Kong, Ireland, Jamaica, New Zealand, and Spain—were devalued with sterling. It was also agreed among central bankers that Britain should be given credits of up to $3,000 million, including $1,400 million standby credit from the IMF (*see* **G9** and **10**). This credit protected the reserves against speculation; but it would have to be paid back out of balance of payments surpluses over the next few years.

Devaluation increases the demand for domestically produced goods and services: imports are replaced by local substitutes and foreign demand for British goods increases. This switch in demand

requires also a switch in scarce resources—labour and capital—into the exporting and import substituting industries, if the new demand is to be met. To release resources for these industries it is necessary to reduce the demand for resources elsewhere in the economy. Accordingly, the devaluation was accompanied by a series of deflationary measures (*see* G41).

Improvement after Devaluation.

In his Letter of Intent to the IMF immediately after devaluation the Chancellor stated the Government's aim to improve the balance of payments by at least £500 million a year. However, progress after devaluation was disappointing and fell far short of official expectations. The current account showed a deficit for 1968 of £319 million: no improvement on the deficit for 1967 of £312 million. Moreover, this improvement came on the invisible and long-term capital accounts: the trade gap actually widened considerably. The value of exports rose by 20 per cent between 1967 and 1968, 8 per cent in price and 12 per cent in volume. But less than half of the increase in volume was due to devaluation, since world trade was growing rapidly. Despite the devaluation the volume of imports rose by no less than 7 per cent, outstripping the growth of output, and largely because of devaluation import prices rose by 11 per cent; so that imports increased in value by by 18 per cent.

The balance of payments was transformed in 1969, improving strongly throughout the year. One reason for the improvement was a statistical correction: the discovery that exports had been systematically under-recorded for some years and that this had reached a level of over £100 million by 1969. But this does not mean that our much discussed balance of payments difficulties could be dismissed as a statistical illusion. The volume of exports grew by no less than 8 per cent between 1968 and 1969, mainly owing to the rapid increase in world trade. However, the British share of world exports fell by an unusually small amount. Imports rose in volume by only 2 per cent, being held back in part by the slackening of output growth and a decline in stock-building. Another contributary factor may have been the *import deposit* scheme, introduced by the Government in November 1968, by which importers were required to deposit with H.M. Customs for a period of six months money equal to half (later 40 and then 30 per cent) of the value of certain imports. The improvement in the balance of payments enabled the Government at the start of 1970 to abolish the restrictions on expenditure by British residents on travel outside the Sterling Area, and at the end of 1970 to abolish the import deposit scheme. Between 1969 and 1970 exports grew in volume by 5·5 per cent and in value by 12 per cent; but this was slower than the growth of world exports as a whole. British imports also grew rapidly; the increase in volume (7 per cent) being far greater than the increase in the real income of the economy (1·5 per cent). Exports did remarkably well in 1971, rising by 13 per cent in value terms and by 5 per cent in volume terms. For the first time in many years the British share of world exports of manufactures rose. On the other hand, the growth of imports was constrained by the stagnation of the economy. Most unusual for Britain, the visible trade balance showed a large surplus in 1971.

The surplus on current account was no less than £440 million in 1969, £610 m. in 1970 and £950 m. in 1971. This improvement occurred both in visibles and invisibles. Between 1968 and 1971 the trade balance improved by over £900 m. and the invisible balance by over £300 m.; its most improved components being private services (*e.g.*, financial, insurance and travel services) and net income from abroad. The total currency flow was transformed from an enormous deficit in 1968 (when the authorities were forced to borrow £1,300 m.) to surpluses of £740 m. in 1969, £1,420 m. in 1970 and no less than £3,350 m. in 1971, some of which represented short-term capital flight from the dollar.

Was the improvement in the balance of payments after 1968 an indication that the policy of devaluation had eventually succeeded? The efficacy of devaluation can only be judged after a few years, and then with difficulty since we need to know what would have happened in the absence of devaluation. Economists have not produced a unanimous answer. The National Institute for Economic Research has suggested that the current account surplus of £600 million in 1970 might have been over £400 m. smaller (£300 m. less on invisible trade) had it not been for devaluation. Undoubtedly the balance of payments was aided by the depressed state of the economy.

Renewed Balance of Payments Problems.

The competitive position of the United Kingdom was weakened after 1970 by an inflation more rapid than in other countries (*see* G45) and by the dollar devaluation of 1971 (*see* G38). These developments contributed to the sharp deterioration in the balance of payments which occurred in 1972. Compared with 1971, exports were up in volume by less than 2 per cent and in value by only 5 per cent, despite an increase in the volume of world trade by 9 per cent. But imports rose by 9 per cent in volume and by no less than 15 per cent in value. There were sharp increases in demand for such consumer goods as cars and colour television sets—no doubt set off by the abolition of hire-purchase restrictions in 1971 (*see* G42)—and the inability of domestic producers to expand their production correspondingly both constrained exports and accelerated imports. The import bill was also up on account of a rapid increase in the world prices of a number of primary products, especially of such foodstuffs as beef, wheat, sugar and coffee. The trade balance deteriorated from a surplus of over £300 million in 1971 to a record deficit of almost £700 million in 1972; and the current account was just in balance. A large private capital net outflow occurred, so that there was a deficit of over £1,100m in the total currency flow.

Floating of the Pound.

The deterioration in the balance of payments contributed to a large outflow of short-term funds in mid-1972, which culminated in a sterling crisis and a floating of the pound on 23 June. This was the first time that sterling had been allowed to float since a period in the 1930s, and it represented a contravention of the increasingly criticised I.M.F. system (*see* G38). The pound floated downwards after June, from about $2·60 = £1 to a value of roughly $2·40 during 1973, and to $2·30 in early 1974. Sterling depreciated even further in relation to such currencies as the mark, the franc and the yen, as the dollar was itself devalued early in 1973.

The falling value of the pound was of no immediate assistance to the balance of payments: experience suggests that the improvement occurs only after a lag of a year or two. In the meantime the devaluation pushed up the domestic price of imports of raw materials and foodstuffs, so raising both the costs of production and the cost of living. The devaluation made a counter-inflation policy both more difficult and more important (*see* G47-8).

Inflation in Commodity Markets.

The current account of the balance of payments deteriorated sharply in 1973, to reach the unprecedented deficit of £1,470 million. Exports did reasonably well, rising by 28 per cent in terms of value and by 14 per cent in terms of volume. However, the import bill soared, increasing by no less than 42 per cent. Import volume increased by 16 per cent, reflecting the rapid upsurge of the economy during 1972, and the emergence of shortages and a need for stockbuilding during 1973. More important was the higher price of imports: up by an average of 28 per cent between 1972 and 1973. This period witnessed a remarkable inflation in the prices of various primary products in world markets. To give some examples, between the first quarter of 1972 and the last quarter of 1973 average price increases in major world markets were as follows: cocoa 173 per cent, copper 115 per cent, cotton 127 per cent, rubber 123 per cent, wool 138 per cent and zinc 308 per cent.

This unprecedented jump in primary commodity

prices stemmed from the sharp and well-synchronised expansion of the major industrial economies during 1972 and 1973, and it was assisted by some speculative buying as a hedge against inflation. No doubt the price trend would be halted and indeed be reversed if the world economy were to move into recession in the aftermath of the oil crisis. But in the meantime the balance of payments and the pace of inflation in Britain were seriously affected by the higher cost of importing foodstuffs and raw materials.

The Oil Crisis.

An event of great importance to Britain and to other industrial countries was the decision of the Arab oil-producing states, taken in October 1973, to restrict oil supplied and to raise oil prices. The restriction of supplies was initiated as a short-run political weapon in the Arab–Israeli conflict; but it revealed a potential for obtaining higher prices which had not previously been exploited by the Organisation of Petroleum Exporting Countries (OPEC). In the past the world demand for oil has grown very rapidly – by about 8 per cent per annum between 1960 and 1973 – but it has been successfully met by expansion of production. A slower growth of oil supply in relation to demand produces scarcity and a rocketing of price. Alternative sources of energy cannot be developed – and thus the demand for oil cannot be curtailed or even its growth retarded – for many years: little can be done about the prices charged by OPEC until the 1980s. However, the maintenance of high prices depends on the ability of the OPEC group to restrict oil supplies to the market despite the incentive of each individual country to take advantage of the high prices by expanding its sales.

It seemed initially that the oil restrictions would produce physical shortages in the economy which would harm production and require rationing and direct controls. By February it appeared that demand would be met, but only at a much higher price. Between September 1973 and January 1974 the oil-producing governments raised their "take" on a barrel of crude oil from $1·75 to $7·00, and the import price was increased from $3·45 to $8·70 a barrel, *i.e.*, an increase of 150 per cent. It was estimated that the British annual import bill for oil might increase by some £2,000m, from £1,500m in 1973 to £3,700m in 1974. The prospects for the British balance of payments, already in deficit on current account by nearly £1,500m in 1973, were stark indeed.

Britain's Debt Repayments.

At the end of 1968 the British Government had short- and medium-term debts outstanding to central banks and the IMF of no less than £3,360 million. This represented about 10 per cent of the national income in 1968 and compared with gold and foreign exchange reserves of only £1,010 million. In 1969, however the surplus on the current account, the inflow of short-term funds and a large positive "balancing item" reflecting unrecorded transactions (*see* table on G32–3) enabled the Government to reduce its indebtedness by £700 million. The continued improvement in the balance of payments and the first allocation of Special Drawing Rights (*see below*) enabled the Chancellor to announce in his April 1970 budget that the outstanding debts were down to £1,650 million while the reserves stood at £1,130 million.

The vast balance of payments surplus of 1971 eliminated almost all of these debts, and indeed the Bank of England lent to foreign monetary authorities under the "swap arrangement" among central banks. The British reserves rose to the record level of over £2,700 million early in 1972. By the end of 1972 the official short- and medium-term indebtedness was nil. However, the 1972 deficit was financed by the return of the loans made to other central banks and a depletion of the reserves.

The large current account deficit of 1973 was entirely financed by a capital inflow, so that reserves actually rose by £210 million to a level of £2,240m at the end of the year. Of these reserves £300m were held in gold, £250m in Special Drawing Rights and the vast majority in dollars. Capital inflow during 1973 took the form mainly of borrowing by the public sector, *e.g.*, the nationalised industries. Just over £1,000m was borrowed in this way under an *exchange cover scheme* whereby the loans were guaranteed against sterling depreciation. In the March 1974 budget the incoming Labour Government announced that the clearing banks had arranged a $2,500m ten-year loan to Britain in the Eurodollar market, to help finance the deficit which was expected for 1974. It was said to be the largest loan ever raised in international capital markets. In this way Britain was able to postpone in part the necessary ad ustments to the new oil situation.

Overseas Investment.

At the end of 1972 the total stock of private long-term investment by the United Kingdom overseas was estimated at £18,520 million and investment by overseas companies in the United Kingdom at £9,505 million. In that year the United Kingdom received income of £1,585 million from its overseas investments and paid out £1,129 million on foreign investments in the United Kingdom, *i.e.*, the net income from interest, dividends and profits was £456 million. Investment abroad takes the form of portfolio investment (on foreign stocks or bonds) or direct investment (by British companies in their overseas affiliates). Well over half of this direct investment now takes the form of profits not remitted by affiliates.

The table indicates that United Kingdom investment abroad rose sharply in the second half of the 1960s despite the policy of requiring "voluntary restraint" on investment in the developed sterling area countries. However, foreign investment in the U.K. also rose rapidly: there was actually a net inflow of investment in 1971. At the same time interest, profits and dividends from British-owned private capital overseas also increased, partly as a result of devaluation raising their sterling value; net private income from abroad exceeding £600 million after 1968.

Should the British Government encourage or discourage private investment abroad? In 1967 and 1968 Professor Reddaway published his Reports on this subject, prepared for the Confederation of British Industry. He concluded that for every £100 of British direct private investment overseas, British exports would immediately increase by about £11, *i.e.*, there would be an initial drain on the balance of payments of £89. The average rate of profit on capital after overseas tax would thereafter be about £8 per annum, or

* Annual averages.

only £5 if capital appreciation was allowed for. In arriving at a policy for foreign investment the short-term balance of payments loss must be weighed against the long-term gain. The importance of the short-term considerations depends on the state of the balance of payments, *e.g.*, if more investment overseas at a time of deficit causes the Government to take deflationary measures, the national cost is great.

Reform of the International Monetary System.

The international monetary system and international liquidity are explained on G9 and 10. There is an increasing shortage of international liquidity, which gives a deflationary twist to the world economy and threatens the continuation of free trade. What means are available to increase international liquidity?

(i) Methods of Increasing International Liquidity.

There are three main alternatives: greater flexibility in exchange rates, a rise in the price of gold in terms of all currencies, and the creation of an international paper money.

The advocates of greater flexibility in exchange rates (*see* G8) argue that greater flexibility would reduce the need for international liquidity: the size and duration of deficits in the balance of payments would be smaller and therefore the reserves required to tide over deficits would be smaller. The critics of greater flexibility point to the possibility of instability in the exchange markets resulting from speculation, and to the danger of a cumulative spiral of devaluation and inflation occurring in some countries.

A rise in the gold price would increase international liquidity; first, by increasing the money value of existing and future gold reserves, and second, by encouraging gold production. However, there are certain disadvantages. It helps those countries most which need help least—those with large gold reserves; it represents a victory for the gold speculators and so acts as a stimulus to further hoarding and speculation in the future; it helps in particular the gold-producing countries Russia and South Africa; and finally, it represents a sheer waste of economic resources: gold has little value except as a means of international payment.

The domestic currency of the United Kingdom is not backed by gold: on a one pound note the Governor of the Bank of England promises to pay the bearer on demand the sum of one pound—another pound note! Yet, within Britain, there is complete confidence in the currency, because it is generally acceptable and so convertible into goods and services. Just as gold no longer backs the domestic currency, there is no need for gold in settlement of international payments. All we need is a generally acceptable international currency, *i.e.*, one in which all countries have confidence.

Such a currency could be created by an international authority constituted for this purpose; and it could be made available to deficit countries, which could then pay their creditors in the new currency. In this way the current shortage of international liquidity could be made good, and indeed gold—Keynes' "barbarous relic"—could be supplanted. There are various difficulties in such a scheme. It would involve some loss of national autonomy and the vesting of considerable power in the international authority issuing the paper currency. Decisions would have to be made as to which countries should receive the new currency, and in what quantities. And there is a fear that it would enable reckless governments to pursue inflationary policies without the discipline imposed by shortage of reserves, and that their inflation would be infectious. Many variations on this basic scheme have been devised in an attempt to surmount these—largely political—objections.

(ii) Special Drawing Rights.

In the past the IMF has merely provided deficit countries with loans, to be repaid over a certain period (*see* G9 and 10). However, the amount of these credit facilities has been increased over time. In 1959 the quotas paid by members to the IMF were raised by 50 per cent, in 1964 by 25 per cent, and in 1970 by about 35 per cent. Moreover, in order to increase the resources available to neutralise the massive movements of short-term funds which had so disrupted balance of payments in 1960 and 1961, the IMF initiated a scheme for a "lenders' club". In December 1961 the main trading countries—the *Group of Ten*—undertook (subject to some control by lending countries over the use of the funds) to make available loans totalling over £2,000 million to the IMF for relending to countries of the Group suffering an outflow of short-term funds.

In 1967 the members of the IMF agreed in principle to a scheme according *special drawing rights* (SDRs) to member countries, and in 1970 the scheme came into operation. SDRs are distributed annually to all members in proportion to their quotas with the IMF. They have a fixed value in terms of gold, and like gold, are generally accepted as a means of payment. Thus a deficit country can use its SDRs to buy the currency of the countries with which it has a deficit, and the surplus countries, in accumulating SDRs, earn a rate of interest on them. This is a movement towards an international paper currency, since the SDRs, unlike IMF loans, do not have to be repaid: they are a permanent addition to international reserves. The first allocation—totalling $3,414 million, of which Britain received $410 million—was made in 1970, and further allocations were agreed for 1971 and 1972. The scheme was launched on a scale which is small in relation to the size of the problem; but it is a step in the right direction.

(iii) The Gold Crisis 1968.

The United States has run a large and persistent payments deficit in the 1950s and 1960s. This was initially financed through the willingness of foreigners to run up dollar balances. However, distrust of the dollar has grown, and between 1960 and 1967 U.S. gold reserves were run down, from $19,500 million to $12,100 million. After the devaluation of sterling in November 1967, the interest of speculators transferred from the pound to the dollar. Since many speculators expected the devaluation of the dollar in terms of gold to be followed by a corresponding devaluation of other currencies, there was a growing demand for gold.

After 1961 the central banks of the major trading nations operated a *gold pool* in the London market, whereby they agreed to exchange gold for currencies at existing official exchange rates. But with the growing speculation against the dollar, the system could not be continued without endangering the U.S. gold reserves. The central bankers gathered for a crisis meeting in Washington on 17 March, and decided to terminate the gold pool. They introduced two markets for gold, with private transactions taking place in the free market at a price determined by supply and demand, and transactions among central banks taking place in the official market at the official gold price. The United States was now prepared to convert dollars into gold only for central banks, *i.e.*, to finance a deficit only on its current plus long-term capital account. In this way speculation against the dollar could be controlled; but the problem of the U.S. deficit on current and long-term capital account was still to be solved.

The further monetary crisis of November 1968, produced by speculation against the franc and towards the mark, the possibility that the incoming Nixon Administration would raise the dollar price of gold, and the limited sales on the free market by gold producers all helped to keep up the speculative demand for gold and its price in the free market. In the first year after the gold crisis the free market price averaged about $40 compared with the official price of $35 a fine ounce.

There was further currency speculation in 1969 in expectation of a realignment of European exchange rates. In August France, with a weak balance of payments, devalued the franc by 11·1 per cent, and in October West Germany, with a persistent surplus, revalued the deutschemark upwards by 9·3 per cent. Thereafter tension in the foreign exchange markets was relaxed, and dishoarding and a fall in speculative demand for gold coincided with large sales by producers, so that the free market price for gold fell to $35 a

fine ounce. The IMF reached an agreement with South Africa to buy South African gold in certain circumstances, *e.g.*, when the gold price is $35 or below. This meant that newly-mined gold could now enter official reserves and that the free market price would be unlikely to fall below the official price.

(iv) The Dollar Crisis 1971.

In 1970 the deficit in the United States balance of payments rose to a record level. This was financed by creditor countries increasing their dollar balances. They had little choice: a large-scale conversion of dollar balances would force the United States to renounce its obligation to supply gold to central banks at $35 per ounce. It became increasingly clear that if the United States failed to reduce its deficit, *e.g.*, by restricting capital outflows or military expenditures abroad, the creditor countries would either have to go on financing American deficits by accumulating dollars or allow their currencies to appreciate in terms of the dollar.

In May 1971, in response to speculative capital movements mainly from the United States to West Germany, the deutschemark was allowed to float upwards, *i.e.*, the authorities allowed its price to rise above the official ceiling. But massive speculation against the dollar continued and in August the United States Government imposed a surcharge on imports and suspended the convertibility of dollars into gold. Currencies of the major trading countries were then allowed to float upwards against the dollar by varying amounts.

(v) Adjustment of Exchange Rates.

The Smithsonian Agreement of 19 December 1971 set the seal on the biggest realignment or exchange rates for nearly a quarter of a century. After negotiations among the Group of Ten it was agreed that the United States would withdraw its surcharge and devalue the dollar against gold if other countries would revalue upwards or at least not devalue. In terms of gold Japan revalued by 8 per cent, West Germany by 5 per cent, 44 countries including the United Kingdom and France did not alter their exchange rates, and 44 countries, all underdeveloped, followed the United States in devaluing by 8 per cent. It was also agreed that there should be a period of greater flexibility in exchange rates, with countries being allowed to alter their exchange rates by 2¼ per cent from the par value in each direction.

The year 1972 saw a rise in the free market price of gold to almost $70 per fine ounce—well above the new official rate of $38. This development reflected the doubts of speculators that the new exchange rates would be permanent. The pound came under speculative pressure in June; and this, combined with a deteriorating balance of payments and the imminence of accession to the EEC., led the British Government to float the pound downwards (*see* G35). Various countries—including Britain, West Germany, Italy, Switzerland and Japan—took measures to try to control speculative capital flows. Partly to prevent speculative capital outflows, interest rates were raised competitively by various governments during the year. For instance, between January 1972 and January 1973, the Treasury Bill rate rose from 3·3 to 5·8 per cent in the U.S. and from 4·4 to 8 3 per cent in the U.K.

Despite the devaluation of the dollar in December 1971 the U.S. balance of payments on current account actually deteriorated in 1972. Speculation against the dollar broke out early in 1973: the West German central bank was believed to have taken in no less than $6 billion in ten days despite its capital controls. The chief foreign exchange markets were closed and on 13 February the dollar was devalued by 10 per cent and the Japanese yen—the strongest currency—was allowed to float upwards. In March the EEC countries agreed that their currencies would float jointly against the dollar, but with the currencies of Britain, Ireland and Italy—then in balance of payments difficulties—temporarily floating independently. The international monetary system had entered a new era of flexible exchange rates.

(vi) Oil and the International Balance of Payments.

In 1973 the oil-producing countries exported oil worth $27 billion, and their surplus on current account was $13 billion. Predictions for 1974 suggested that their export proceeds would amount to $85b. and their current account surplus to some $60b. This surplus would involve a corresponding deficit for the oil-importing countries as a group. Such a transformation in the international balance of payments is unprecedented in its scale and speed. It raises the important question: how is the imbalance to be financed?

The oil-producing countries will no doubt invest their surplus funds abroad, so that there will be a corresponding surplus on the capital account of the oil-importing group of countries. But it is unlikely, without international agreement and co-ordination, that the current account deficit of each individual country will be offset by a corresponding capital inflow. There is a danger that each country will take undesirable and self-defeating measures, *e.g.*, deflation and import controls, to improve its current account. It was therefore agreed by the major industrial countries in January 1974 that capital transfers among countries should be the means of overcoming individual imbalances.

(vii) Prospects for Further Reform.

The system of correcting international imbalances operating in the post-war period under the articles of the International Monetary Fund became increasingly unsatisfactory in the 1960s. The attempts to maintain stable exchange rates in the face of rapid change in the competitiveness of different countries, increasingly inadequate international liquidity and more massive speculative capital movements produced a series of foreign exchange crises and deflationary internal policies.

The movements in the 1970s towards greater control of "hot money" flows, greater flexibility of exchange rates, and increased international liquidity would help to correct international imbalances. But there were various reasons for believing that they would not provide a permanent solution. International companies, with structures that span exchange control barriers, have accumulated vast sums which they move about in search of security and profit. This development, together with the growth of the Eurodollar market (*see* G10), makes control of short-term capital flows very difficult and gives rise to the possibility of exaggerated and destabilising movements in international exchange rates. Recent experience of exchange rate adjustments suggests that the balance of payments takes a long time—perhaps two or three years—to adjust to a devaluation. In the meantime there might be wage increases to compensate for the increase in the cost-of-living brought about by devaluation, which in turn tend to neutralise the devaluation. International liquidity grew very rapidly in the years 1971–1973, mainly because the United States deficit was financed by other countries accumulating dollars. But the fact that official dollar holdings were not in general convertible meant that the apparent increase in liquidity was to a large extent illusory.

The severe imbalance in international payments resulting from the oil crisis made it all the more important that there be international monetary reform to help in the correction of such imbalances without sacrificing full employment, trade and economic growth. The institution charged with bringing about reform was the *Committee of Twenty* nations, set up by the IMF in 1972.

The European Economic Community.

The *European Economic Community* (EEC), otherwise known as the Common Market, was set up by the Treaty of Rome, ratified in 1958. It consisted of six full members—Belgium, France, Holland, Italy, Luxembourg, and Western Germany. Britain had participated in the negotiations which led up to its formation, and had argued in favour of a looser "free trade area" without a common external tariff, and excluding

trade in agricultural products. No compromise acceptable to the Six was found, and Britain joined with six other European countries—Austria, Denmark, Norway, Portugal, Sweden, and Switzerland—in forming the *European Free Trade Area* (EFTA).

(i) Unsuccessful Negotiations.

In 1961, after the EEC was seen to be highly successful in terms of the growth of production and trade, the British Government decided to apply for membership. There were three main problems to be resolved in the negotiations. The first two—the trading links with Commonwealth countries and the position of British agriculture—were those which had influenced the British attitude at the time of the formation of the EEC. Now Britain also had obligations to her EFTA partners. The Common Market countries welcomed the British application, but made it clear that negotiations must take place within the framework of the Treaty.

In the course of prolonged negotiations, considerable progress towards an agreement was made, until in January 1963 the stage was set for a final round of bargaining. It therefore came as a surprise when, despite opposition from the other five, a French veto was imposed on the British application. Perhaps the fundamental reason for the breakdown can be inferred from a statement attributed to General de Gaulle: "The Europe I prefer is the Europe of the Six". In 1967 the Labour Government began discussing with the EEC countries the possibility of British membership, but in December France vetoed the opening of negotiations. With the resignation of General de Gaulle in 1969 the Common Market issue became live again, and negotiations on the British application opened in 1970.

(ii) The 1970 White Paper.

In February 1970 the Labour Government published a White Paper assessing the economic consequences of entry for the United Kingdom. The report recognised disadvantages as well as advantages. Britain would have to adopt the common agricultural policy and make a net contribution to the financing of that policy. Food prices would rise in Britain through the imposition of levies on imports from non-Community sources and the payment of Community prices for imports from other members. The maximum increase likely to occur in retail food prices was estimated to be in the range 18–26 per cent spread over a period of years. The dismantling of tariffs on trade with the Community would reduce industrial prices.

The tariff cuts and the response of wages and prices to the increased cost of living would directly affect both industrial imports and exports; it being suggested that the balance of payments might be worsened by £125–275 million per annum on this account. But there would also be longer-run, dynamic and less predictable effects, through the stimulus to British industry of being in a market of 300 million inhabitants and growing more rapidly than our own. The White Paper concluded that the balance of economic advantage was uncertain and that the precise conditions negotiated for entry would be important.

(iii) The Werner Plan.

In 1970 the Commission of the European Economic Community published the Werner Plan, a report on the establishment of economic and monetary union of the EEC. The plan aimed at transferring within a decade the principal economic decisions from the national to the Community level, and at establishing within the Community complete freedom of movement of goods, services, persons and capital, with fixed and constant rates of exchange between national currencies or, preferably, a common currency. A centre of decision for economic policy would be established and made responsible to a European parliament. There was to be a common system of value-added taxation (*see* G50), and other taxes would be brought into line. The member countries have agreed to the initial stages of the Plan, *e.g.*, to more co-operation in international currency arrangements.

These proposals have ar-reaching economic and political implications, since they involve a considerable reduction of national sovereignty. For instance, the loss of power to correct balance of payments deficits by means of trade controls or variation in the exchange rate implies either that the deficit country's currency should be generally acceptable to its creditors (so that the country within the Community—like a region within a country—simply cannot have a balance of payments problem), or the country must resort to deflation. And even if there is a common currency, it is very likely that resources will concentrate in some regions of the Community to the neglect of other regions, possibly those far from the main centres of production and consumption. Complete mobility of resources is likely to produce a regional problem within the Community just as it can produce a regional problem within a country. But the Community may not, to the same extent as a country, possess the political power and determination required to remedy the problem.

(iv) The Successful Negotiations.

In 1970 the incoming Conservative Government continued with its predecessor's application. In July 1971 the negotiations were successfully concluded.

The conditions of entry were published in a White Paper. The EEC's Common External Tariff (CET) was accepted with minor qualifications. Tariffs on trade between Britain and the Community were to be eliminated by stages and there was to be a gradual application of the CET to British imports currently duty-free (*e.g.*, imports from EFTA and Commonwealth countries). The interim period would last 5 years.

The Common Agricultural Policy (CAP) was also accepted subject to transitional and special arrangements. The CAP is maintained by a system of variable import levies setting *threshold prices* on imports of agricultural products from outside the Community, and by means of *intervention prices* at which agricultural products of the Community are purchased. The intervention price is slightly higher than the threshold price of a product. Britain agreed to introduce this system in the first year of membership and gradually to raise both intervention and threshold prices over a period of 5 years. In the interim period, to ensure that prices to producers were equated, levies and compensation payments would be made on agricultural trade between Britain and the rest of the Community. According to the White Paper, food prices in Britain would rise annually by about 2·5 per cent more rapidly during the period of transition.

The Community has a large Budget required mainly for supporting the CAP, *i.e.*, for subsidising Common Market farmers. It was agreed that Britain should contribute to the Community Budget roughly according to our share of the total GNP of the Community. Thus Britain would contribute about 20 per cent of the total. However, during the five-year interim period, the share would gradually be raised from an initial contribution of under 9 per cent.

The Government negotiated as far as possible to protect the interests of those countries which depend heavily on their trade with Britain. For instance, New Zealand is highly dependent on exports of dairy products and lamb to the British market. It was agreed that New Zealand would be able to export minimum guaranteed quantities of butter to Britain (the minimum falling to 80 per cent of the present levels by 1977) at a guaranteed price equal to the average of prices in our market during the period 1969–72. The arrangement for the period after 1977 would be subject to review. The New Zealand Government was satisfied with this and other concessions negotiated on its behalf. The Commonwealth Sugar Agreement, under which sugar-producing developing countries —many of them with mono-crop economies— export sugar to Britain at high prices, was to continue until the end of 1974; and thereafter these countries were to be given either Associate status or trade agreements. Their governments expressed satisfaction at the Community's assurances that it would safeguard their interests.

It was agreed that the non-Asian developing countries of the Commonwealth would be offered

a choice of either Association with the Community —involving aid from the EEC and preferential trade agreements—or commercial agreements to expand and facilitate trade with the Community. The current trading arrangements between the United Kingdom and these countries would continue until 1975. The Asian Commonwealth countries would fall within a Generalised Preference Scheme for developing countries and would benefit from the suspension of the Community tariff on imports of tea. Australia and Canada would suffer only a little as many of the industrial raw materials which they export already enter the Community duty-free (*e.g.*, wool and some metals), and certain other industrial materials important to Britain (*e.g.*, newsprint and woodpulp) would become more or less duty-free.

British entry involved free movement of both capital and labour between the United Kingdom and the rest of the Community. The Government proposed to proceed by stages towards complete mobility of capital, starting with direct investment. Entry also involved some fiscal harmonisation: Britain had to follow all the EEC countries in introducing a *value added tax* (*see* G50). However, the high British customs duties on oil alcoholic beverages and tobacco could be effectively retained and yet avoid contravention of the Treaty of Rome by becoming internal taxes.

(v) Accession to the Community 1973.

The United Kingdom acceded as a full member of the EEC on 1 January 1973. Two of Britain's EFTA partners—Ireland and Denmark—joined on the same date, so forming an expanded Community of nine countries. The other EFTA partners hoped to reach individual trading arrangements with the EEC. The economic ties with the Sterling Area were weakened and those with the Community strengthened. For instance in 1972 the Government relaxed restrictions on direct investment by British firms in the EEC and introduced controls on capital transactions with the Overseas Sterling Area. In 1972 trade with the original six members of the EEC accounted for about 23 per cent of total British trade, trade with the EFTA partners about 13 per cent, and with the Commonwealth 19 per cent (*see* K188). After accession, trade with the EEC was expected to expand sharply and the proportion of trade with the former EFTA countries and the Commonwealth to fall.

It was on the issue of monetary union that the first major economic problem for Britain arose after entry. In conformity with the Werner Plan (*see above*), the Community agreed in March 1973 to fix the exchange rates between member currencies and to float them together against the dollar (*see* G38). Britain and Italy—then in balance of payments difficulties—insisted that they be permitted temporarily to float independently. There is a danger that the right to vary exchange rates be withdrawn from member countries without there being uniformity in other policies. If there is to be a monetary union, there should also be conformity in industrial relations and incomes policies. For if inflation is more rapid in Britain than in her partner countries, and if Britain is prevented from adjusting the exchange rate or imposing import restrictions against her partners to correct the ensuing balance of payments deficit, the Government might see no alternative but to deflate the economy: stagnation could ensue.

(vi) Labour Government Policy.

The Labour Party in opposition had criticised the terms of British entry to the EEC negotiated by the Conservative Government. In April 1974 the incoming Labour Government published a White Paper explaining its policy of renegotiating these terms. The Government wanted major changes in the CAP to allow low-cost producers access to the British market, a fairer method of financing the Community budget in relation to the benefits received, the retention by Parliament of powers to pursue effective regional, industrial and fiscal policies, and better safeguards of the interests of Commonwealth and developing countries; and it was against the current programme for a monetary union by 1980. The Government intended to allow the British electorate to vote on the renegotiated terms or, if the negotiations failed, on its proposals to withdraw from the EEC.

2. INTERNAL DEVELOPMENTS

Economic Fluctuations and Government Policies.

We begin with an account of fluctuations in economic activity and of Government attempts to control them.

Government Budgetary Policies.

There is probably no country in the world which has made fuller use than Britain of budgetary policy as a means of stabilising the economy. Since 1941, almost all adjustments to the total level of taxation have been made with the object of reducing the excess in total demand or of repairing a deficit. British Governments have accepted Keynesian principles—first laid down by Lord Keynes—for managing the economy by adjusting the level of taxation and private saving relative to public expenditure and private investment. This does not mean to say that British policies have always been successful. Apart from the difficulty of deciding when demand is excessive or deficient, there are the difficulties that data are available only with a serious time-lag, and may be inaccurate; that economic events cannot be predicted with any certainty; and that the quantitative effects of Government measures are not easy to estimate.

Economic Fluctuations.

That Governments were unable to eliminate fluctuations in the economy is made clear in the table below. Indeed, some commentators have argued that Governments, concerned to hold General Elections in times of boom and misjudging movements in the economy, have tended to do " too much too late " and so have actually accentuated the " stop-go ". Whether this conclusion is justified or not, it is certainly true that General Elections have tended to coincide with periods of temporary prosperity! The table shows that the period 1959–60 was one of reflation and boom, 1961–62 recession, 1963–65 upswing and boom, 1966–67 stagnation, 1968 slight reflation, 1969–71 recession and growing unemployment and 1972–73 sharp upswing. Industrial production was more unstable than GDP and investment more unstable still.

Recession 1961–62.

Restrictive measures to curb the boom and improve the worsening balance of payments

ECONOMIC FLUCTUATIONS IN THE BRITISH ECONOMY 1960–73

	Percentage change over previous year in:			
	GDP*	Industrial Production *	Investment *	Number unemployed **
1960	5·7	7·0	9·8	−20·5
1961	2·6	1·3	9·7	7·2
1962	1·2	1·0	−0·4	40·1
1963	3·8	3·4	1·7	−7·8
1964	5·7	8·3	16·5	−24·8
1965	2·8	3·1	4·1	−6·6
1966	1·7	1·3	2·6	34·2
1967	1·6	0·6	6·7	27·0
1968	3·6	5·2	5·0	−0·9
1969	2·0	2·8	−1·0	1·7
1970	1·6	0·1	2·0	5·8
1971	1·4	0·5	0·5	41·7
1972	2·7	1·6	1·3	−9·8
1973	5·4	7·7	4·3	−34·1

* At constant prices.
** Number unemployed in fourth quarter.

position were first taken in 1960. Bank rate was raised, restrictions on hire purchase were imposed, and the April Budget was restrictive. To exert pressure on the banks' liquidity positions, and so help to curb bank advances, the banks were called upon to place special deposits (*see* G23) with the Bank of England.

The 1961 Budget was sternly deflationary: profits tax and some indirect taxes were increased; but there was a major reduction in surtax. In addition the Chancellor was granted powers to introduce, if he considered it necessary, an economic "regulator": a surcharge on, or rebate of, indirect taxes by up to 10 per cent. This power provides greater scope for using fiscal measures to influence the economy in the periods between Budgets. In July 1961 the Chancellor introduced a collection of restrictive measures. These measures were primarily intended to ease the critical foreign exchange situation but they were not without effect on the domestic economy. Bank Rate was raised to 7 per cent. To restrict the growth in demand, the Chancellor imposed a 10 per cent surcharge in indirect taxation and called the banks to increase their special deposits at the Bank of England. Furthermore, the Chancellor announced that he aimed to restrict the increase in government spending. Not only was the outflow of funds stopped, but it was actually reversed. These measures were all too successful in restricting demand at home: there was a fall in industrial production in the second half of 1961. However, the 1962 Budget was no less restrictive in intention than the 1961 Budget.

Boom 1963–65.

From the summer of 1962 onwards, monetary and fiscal policies were designed to stimulate economic activity. Bank Rate was reduced to 4 per cent, all special deposits held by the Bank of England were released, qualitative restraints on bank lending were abolished, some post-war credits were released, investment allowances for industry were increased, and the purchase tax on cars reduced.

January 1963 saw further reduction in purchase taxes, and a very considerable increase in social payments. The estimated overall Budget deficit for 1963–64 was more than £600 million greater than that of the previous year. Tax reliefs were announced and, to stimulate investment spending by companies, depreciation allowances were increased for tax purposes. In early 1963 there was substantial under-utilisation of capacity in many branches of industry. Labour resources for expansion were available, in that unemployment—at over 3 per cent—was higher than in any period since the war. Consequently the economy could respond to the expansionary April Budget: national output rose by more than 5 per cent over the year.

By 1964 the economy was beginning to show signs of strain, and the trade figures revealed a rapid deterioration in the balance of visible trade. The Chancellor's objective in his April budget was to slow down the rate of growth without producing deflation. He planned a large budget deficit, but provided for additional taxation by increasing the duties on tobacco and alcoholic drinks by about 10 per cent.

Both consumption expenditure and industrial production jumped sharply towards the end of 1964, and there were reports of a growing labour shortage. The balance of payments was heavily in deficit throughout the year. Nothing was done about it, however, until after the General Election in October. In November the new, Labour Government presented a "little budget." An additional 6*d*. in the £ was placed on the standard rate of income tax, and there were increases in petrol duties, in National Insurance contributions and payments. But old-age pensions were increased. During the sterling crisis of November (*see* G34) Bank Rate was raised to 7 per cent to stem the outflow of funds, but this was not accompanied by a "credit squeeze" to restrict productive investments, as in the crisis of 1961. Unlike some of his predecessors, the Chancellor had not opted for deflation as the cure for the balance of payments deficit. Instead, reliance was placed on an import surcharge and an export rebate. However, the British policy came under fire from some European Governments, who called for a deflation of the British economy.

The 1965 Budget was not deflationary: the Government's overall deficit for 1965–66 was estimated at £720 million. In July, because the balance of payments had shown no sign of rapid improvement, the Chancellor found it necessary to introduce further measures: tighter controls on foreign exchange and on the terms of hire-purchase foreign exchange and on the terms of hire-purchase, and a postponement of public expenditure programmes. But this action was not sufficient to produce deflation, and at the end of the year unemployment was still very low.

The 1966 Budget was somewhat deflationary; but its impact was delayed until September when the new *selective employment tax* (SET) came into force (*see* G49). Up to mid-1966 the Labour Government's policy can be summarised as follows: to restrict the growth of demand somewhat but not as drastically as in the past, to take direct action on the immediate balance of payments, and to strengthen the long-run balance by means of productivity policy and incomes policy. Full employment was maintained between early 1964 and early 1966.

Stagnation 1966–71.

Balance of payments difficulties eventually produced a deflation of the economy. In mid-1966, during yet another run on the pound, the Government panicked. In its "July measures" the Government raised indirect taxation 10 per cent by means of its "regulator", placed a 10 per cent surcharge on surtax, tightened building controls, cut public investment for 1967/8, increased hire-purchase restrictions, and raised Bank Rate to 7 per cent. As a result of these measures the economy went into recession in the second half of 1966. Employers now began to lay off workers, and unemployment rose from 1·2 per cent of the labour force in early 1966 to average 2·2 per cent in 1967.

1967.

Despite growing unemployment the Chancellor produced a "no-change" April Budget, with an estimated surplus of £640 million. The balance of payments prevented him from taking reflationary measures. In mid-year the Government gave some stimulus to consumer expenditure by relaxing hire purchase terms and increasing family allowances. But the balance of payments deteriorated, and, since further deflation was politically unacceptable, the Government devalued the pound. Devaluation was itself strongly reflationary—increasing demand for exports and for import-substitute goods—and had to be accompanied by measures to release resources for these industries. Bank Rate was raised to the unprecedented height of 8 per cent, bank advances were limited to all but priority borrowers, *e.g.*, exporters, hire purchase on cars was tightened, corporation tax was raised to 42·5 per cent, and the SET premium was to be withdrawn except for Development Areas.

There were also to be cuts in defence, other public spending and nationalised industries' investment. Further cuts in government spending were announced in December, and again in January, when future defence spending was considerably reduced because of the decision to withdraw forces from East of Suez, and the planned rise in the school-leaving age from 15 to 16 was put off until 1972. Despite these several blows of the axe, public expenditure was still likely to rise in 1968/9 by nearly 4 per cent in real terms; but the rise in 1969/70 was estimated to be no more than 1 per cent.

1968.

The April budget was highly deflationary. The Chancellor increased taxation to yield an additional £920 million per annum. Most of this came from indirect taxation, with purchase tax and taxes on spirits, wines, and tobacco all raised. Motorists were particularly hit by the increased vehicle and petrol taxes—perhaps not unfairly in view of the heavy social costs caused by road congestion. SET was to be raised 50 per cent, and betting duties were put up. Partly to gain

support for the incomes policy, the Chancellor raised family allowances and placed a heavy "special levy" for one year on unearned income above £3,000 per annum. In deflating the economy the Chancellor was attempting to reduce private consumer demand so as to free resources for the export market and for replacing imports. Without such a transfer of resources the advantage gained from devaluation would be lost. His strategy was to produce an overall balance of payments surplus of the order of £500 million before resuming growth, and in this way to break the vicious circle of "stop-go".

There was a stronger recovery of consumer demand and output and a weaker improvement in the balance of payments in 1968 than the Chancellor had expected, and further restrictive measures were taken during the year. In May bank lending restrictions were tightened selectively, and in November hire purchase terms were tightened and the "regulator" used to raise indirect taxes by 10 per cent.

1969.

In February Bank Rate was raised to the high level of 8 per cent, partly to help reduce bank lending and partly to retain short-term funds in London: owing to the shortage of international liquidity (*see* G37) central banks compete for short-term capital by raising their discount rates.

The April Budget was somewhat restrictive; an additional £350 million per annum being raised in taxation. This was achieved mainly by increasing corporation tax to 45 per cent, and SET. In an attempt to encourage saving the Chancellor introduced a contractual savings scheme (Save As You Earn) offering attractive tax-free interest payments after a five-or seven-year period. Perhaps as a result of pressures from Britain's creditor, the IMF, the Chancellor emphasised the importance he would give to monetary policy (*see* G24). The Budget continued the strategy of improving the balance of payments at the expense of consumption.

In June the Chancellor published a Letter of Intent to the IMF stating his intention to limit the annual increase in real public expenditure to 1 per cent, and the increase in *domestic credit expansion* to £400 million. Domestic credit expansion is defined as the increase in the money supply adjusted for changes resulting from external transactions. In fact domestic credit expansion turned out to be negative in the financial year 1969/70: credit was extremely tight except for the manufacturing sector. The growth of the economy in 1969 was slight, output being about 2 per cent up on 1968. Investment and consumption stagnated, and the main impetus for expansion came from exports.

1970.

Early in the year there was some slack in the economy, which could be taken up by a policy of reflation. With the balance of payments improved and an election not far ahead, the Chancellor therefore reduced taxation by £220 million. Even then, because expenditure was to be restrained and income tax receipts rise with the inflation, he expected a Government budget surplus of £620 million. It could not be claimed that this was an electioneering budget: output was planned to rise by 3·5 per cent in the next year. But the period of severe restraint on private consumption was over, the expected increase being 3·9 per cent. Tax relief came largely in the form of increased personal allowances, but these were so arranged that people with lower incomes benefited most. Private investment was helped by the removal of quantitative controls on bank advances, and by increasing initial tax allowances on industrial building. The strength of the balance of payments enabled the Government to reduce Bank Rate to 7 per cent in the Budget.

In October the new Conservative Government announced cuts in both public expenditure and taxation, taking effect from April 1971. There was to be a 6d. cut in the standard rate of income tax and a cut in corporation tax. Also investment grants were to be replaced by a system of 60 per cent initial allowances. Prescription charges and dental charges were increased, the subsidy on welfare milk was ended, the price of school meals was raised, and the system of import levies on farm produce was extended. These changes involved a redistribution of income away from the poor. However, a *family income supplement* (FIS) was introduced to provide a cash benefit for poor families with children.

Although real output grew by only 1¼ per cent in 1970, the Chancellor did not take any measures which would have an immediate reflationary effect. Monetary restrictions, *e.g.*, requirements of increased *special deposits* (*see* G23), were applied during the year.

1971.

With business profits and liquidity down and business confidence weak, private investment was low and the economy continued to stagnate. There was a need for a reflationary policy in 1971. The April budget was somewhat reflationary with tax reductions of £550 million in the financial year 1971–72 and £680 million in a full year, inclusive of the reductions previously announced. The Chancellor claimed as his objective an increase in output of about 3 per cent per annum. The main budget changes for 1971 were a further cut in corporation tax to 40 per cent, a halving of SET, an increase by £40 per child in the tax allowances for children, a reduction in surtax particularly for very high income earners, and a general increase in national insurance benefits and contributions.

The economy did not appear to respond to the Budget measures, and further but minor reflationary action was taken during the year. In July purchase tax rates were reduced by two-elevenths and in November the Government announced additional capital expenditure by the public authorities and by the nationalised industries.

1971 was also a year of important monetary changes. The Bank of England abolished the ceiling for lending by banks and repaid outstanding special deposits. Associated with the large inflow of short-term funds from abroad, the money supply expanded rapidly and Bank Rate fell from 7 per cent to 5 per cent. Many interest rates were thus below the rate of price inflation, so that the effective rate of interest incurred on borrowing could actually be negative! In September the Bank of England introduced new techniques of monetary control which are outlined on G23. Also the Government removed all restrictions on hire-purchase, credit sale and rental agreements.

Reflation 1972–73.

By January 1972 the economy showed little sign of reflation and total unemployment in the United Kingdom exceeded one million. How was the Government's inaction to be explained? Part of the explanation may be that the Chancellor underestimated the degree of recession in 1971 and the delay before his reflationary measures would take effect: when demand increases stocks are first run down before production is expanded, and employment tends to lag behind movements in production. There is the possibility that the economy was not as depressed as the unemployment figures would suggest: given higher unemployment benefits, workers were choosing to remain unemployed in search of the right job longer than in the past. It is also likely that the Government was purposely timid in its reflationary policy in order to stem the rapid inflation of prices. Nevertheless, the conclusion cannot be avoided that the Government had acted too little and too late.

1972.

The March Budget was highly reflationary: in aiming for an annual growth rate of 5 per cent the Chancellor reduced taxation in 1972/3 by an estimated £1,380 million. The main tax reduction (£960 m.) took the form of increased personal allowances (deducted from income before assessment of income tax). This meant that all taxpayers would pay £1 a week less in tax. Old age pensions and other National Insurance benefits were to be raised in the autumn, but National Insurance contributions on earnings between £18 and £48 a week were raised to finance this. Rates of purchase tax of 30 and 45 per cent were reduced to 25 per cent in anticipation of its abolition and replacement by a *value added tax* (*see* G50). To

encourage private investment the Chancellor introduced free depreciation—*i.e.*. an allowance of 100 per cent of investment expenditure against income liable to tax in the year of the investment—for all investment in plant and machinery, and an initial allowance of 40 per cent for expenditure on industrial buildings (*see* G13).

The reflationary Budget had an effect primarily on consumption. Between 1971 and 1972 private consumption grew in real terms by 6 per cent. Expenditure on consumer durables—encouraged by the ready availability of credit and the abolition of restrictions on hire-purchase—increased by no less than 25 per cent. The money supply grew rapidly until mid-1972, and this kept interest rates down. Despite the low interest rates and the Budget incentives, gross investment did not pick up significantly. However, surveys of businessmen's investment intentions suggested that confidence was gradually being restored, and investment could be expected to grow rapidly in 1973. The danger of a " consumption led ", rather than " export led ", reflation of the sort initiated in 1972 is that it may impair the balance of payments. Indeed, a remarkable expansion of imports of consumer goods and in particular consumer durables did take place in 1972 (*see* G35).

1973.

Although unemployment was falling sharply and production growing rapidly, in early 1973 there was still plenty of plant capacity and labour in reserve: unemployment stood at over 700,000. Measures were urgently needed to improve the deteriorating balance of payments, but there was no case for restraining the economy, since idle resources were available to produce additional exports and import substitutes. The Chancellor in his March Budget stated his objective to be sustained economic growth, maintained at an annual rate of 5 per cent over the following year. To this end he presented a fairly neutral budget: although it contained important tax reforms (*see* G50), no significant change was expected in aggregate taxation.

The money supply had expanded very rapidly until mid-1972, and the Chancellor proposed to continue the monetary restraint imposed in the second half of 1972. Probably this had as much to do with the need to raise interest rates so as to prevent a capital movement out of sterling as with domestic policy. To meet the public sector borrowing requirement without increasing the money supply, he proposed, *e.g.*, to issue new Government stocks and new British Savings Bonds and to increase the number of prizes on Premium Bonds. These measures notwithstanding, it seemed that, in order to finance the public sector borrowing requirement which was expected to be no less than £4,400 million in the financial year 1973/4, the Government would have to accept rapid increases either in the money supply or in interest rates. In the event, both occurred.

The most immediate economic problem facing the British Government in 1973 was the rapid inflation of costs and prices. It could be said, therefore, that the most important test of the Budget could be its success or failure in gaining public support for the Government's pay and prices policy (*see* G48). Here the Chancellor could have done more. He decided to raise pensions by 15 per cent in October, to provide financial help for ratepayers who suffered more than a 10 per cent increase in rates owing to revaluations, to reduce value added tax on sweets and children's clothing and footwear, and to impose a Land Hoarding Charge on delays in developing land with planning permission for housing. However, he was not willing to increase family allowances, nor to subsidise the foods which had risen sharply in price, nor to withdraw the £300 million a year tax concession for surtax payers and those receiving investment income which he had announced in his 1972 Budget to take effect in 1973 (*see* above).

Growth in the economy slowed down during 1973, coming almost to a halt by the end of the year. Although unemployment did not drop below 500,000, unfilled vacancies rose to the record level of 360,000 in the fourth quarter. Production was increasingly held back by supply bottlenecks, owing to shortages of labour in certain places and with certain skills, and of materials and components. The startling rise in the price of oil and of other imports acted to deflate the economy, *i.e.*, these higher prices meant lower real incomes and therefore a fall in the demand for other goods and services. But the oil shortage also curtailed production. To prevent the growth of excess demand in the economy, the Chancellor introduced a December budget. His most important measure was to cut public spending, particularly on capital projects, beginning in 1974 and amounting to £1,200m, in the financial year 1974–75. Severe hire-purchase and other credit controls were also re-established. However, the Chancellor missed his opportunity to redistribute income from the rich to the poor and so to strengthen support for the Government's incomes policy at this difficult time of falling real incomes.

1974.

Production in the first quarter of 1974 was badly affected by the three-day working week, imposed by the Government in response to the overtime ban and subsequent strike in the coal mining industry (*see* G48). Shortage of coal was now the problem: indeed, the restrictions on exports of oil to Britain had been relaxed. With the fall in production there was a running down of stocks, a diversion of exports to the home market and a sharp increase in imports. The trade deficit increased to unprecendented levels: over £400m. in the month of February. The miners' strike was settled and full-time working was restored by the incoming Labour Government in March.

Three weeks after taking office the new Chancellor presented his first budget. Overall, the effect of the budget was deflationary: taxation was to be raised by £1,400m. and Government expenditure by only £700m., and the public sector borrowing requirement would be down to £2,700m. The main forms of additional expenditure were higher retirement pensions, a subsidy on basic foodstuffs, *e.g.*, milk, which was expected to reduce the increase in food prices during 1974 by 6 per cent, and provision for an expanded local authority housing programme. The main increases in taxation were as follows. The standard rate of income tax was raised by 3p to 33p in the pound and the income at which higher rates were to be paid was lowered, but personal tax allowances and child allowances were increased; excise taxes on alcoholic drinks and cigarettes were raised, and VAT was introduced on petrol, sweets, soft drinks and ice cream. The Chancellor announced very large increases in the prices of coal, electricity, steel, postage and rail fares, in order to reduce the growing need for State subsidisation of these nationalised industries. Corporation tax was raised to 52 per cent, and employers were to pay a higher flat rate contribution to finance the higher National Insurance benefits announced in the budget (*see* G26). The Chancellor announced various measures to reduce tax avoidance, *e.g.*, by making income from work or company directorships abroad liable to income tax; payment to managers in the form of shares under *share option* schemes would also be liable, and children's investment income would be aggregated with their parents' for tax purposes. Tax relief on interest payments would apply only to the interest on a mortgage of up to £25,000 in respect of an owner-occupier's main house. A new tax on lifetime gifts would be introduced to close the loophole by which estate duty could be avoided (*see* G50). To equalise the distribution of wealth the Government intended to levy an annual wealth tax on the rich; a Green Paper would be issued to get public discussion of proposals for the tax.

By redistributing incomes the Chancellor made it easier for the Government to gain the support of the trade union movement for whatever measures it introduced to control inflation. On the other hand, the higher prices of coal, electricity, steel, petrol, cigarettes, etc., and the National Insurance contributions of employers would raise costs and prices generally and so activate the *threshold agreements* negotiated under Stage Three of the Conservatives' counter-inflation policy (*see* G48). The Chancellor estimated that output at the end of 1974 would

be 2·5 per cent higher than a year previously. The danger was that the budget, in offering no incentives to private investment or to exports, would fail to prevent the economy from moving into recession during 1974.

Planning for Faster Growth.

There has not only been dissatisfaction with the uneven way in which the economy has grown. There has also been increasing dissatisfaction with the rate of growth achieved in the economy over the past decade or so. The economies of most other industrial countries have expanded at a much faster rate (*see* G12).

(i) The National Economic Development Council.

To stimulate a more systematic study of the problems involved in securing a faster and more even rate of growth in the British economy, the Conservative Government established the *National Economic Development Council* (NEDC or "Neddy"). The two-tier organisation was similar to that of the corresponding planning council in France. The Council itself consisted of representatives from the T.U.C. and employers' organisations, Government ministers and independent members, and it was served by a group of experts. This group undertook research into the problems of securing a faster rate of growth, into the means of overcoming obstacles to growth, and into the economic policies which could be most conducive to faster growth.

In its first report, in 1963, the Council made a projection for the economy. It adopted a target rate of growth of output over the period 1961–66, equal to 4 per cent per annum, which was substantially faster than the rate of growth actually achieved in previous years. It attempted to predict how investment, exports, imports, consumption, and the output of each industry would have to grow if the target rate of growth was to be achieved. The merit of this exercise was twofold; it helped to focus Government attention on the long-term, by showing that policies designed to solve short-term difficulties might intensify the problem of raising long-term economic growth; and, by bolstering expectations, it encouraged firms to invest.

A particularly interesting feature of the work of the NEDC is its study of individual industries. Seventeen major industries were surveyed in detail to assess the changes in output, employment, productivity, investment, and exports which were feasible in each industry. Economic Development Committees (EDCs)—which have come to be known as "little Neddies"—were established as part of the NEDC machinery to report on the problems of individual industries. It is impossible for an individual firm or industry to make correct decisions on future expansion without knowing how the rest of the economy will behave; by relating planning at the national level and planning at the level of individual industries the NEDC did valuable work.

(ii) The Department of Economic Affairs.

In October 1964 the Labour Government established a new *Department of Economic Affairs* (DEA). While short-term measures to regulate the economy or the balance of payments remained the responsibility of the Treasury, the DEA took over from the Treasury the responsibility for long-term economic policy. The DEA was charged with the task of preparing and implementing a realistic plan for economic expansion, a prices and incomes policy and an industrial and regional policy. The NEDC, now reconstituted, became a consultative and advisory body; a link between the Government and the economic community. However, the EDCs continue to function and have produced a great many reports. The division between short- and long-term planning proved unsatisfactory, and in 1969 the DEA was abolished and its functions reverted to the Treasury.

(iii) The National Plan.

The *National Plan* for the British economy over the period 1964–70 was published by the Government in 1965. The Plan was based on the assumption that output would rise by 3·8 per cent per annum over the period. Since the labour force was expected to grow at 0·4 per cent per annum, this meant an annual growth in productivity of 3·5 per cent—considerably higher than the 2·7 per cent average over the period 1960–64. The Plan specified the changes in investment, consumption, and public expenditure required to achieve this target.

In many ways, the crucial assumptions were those concerned with the balance of payments. The Plan supposed that exports would grow more rapidly than imports so that the balance of payments would improve steadily. But if the steady improvement did not occur, the whole Plan could be jeopardised, in that the balance of payments difficulties might, as in the past, appear to justify policies to restrict the growth in domestic output. Indeed, this is precisely what happened. The tardy improvement in the balance of payments led the Government eventually in July 1966 to deflate the economy. The ensuing stagnation meant that the Plan's targets for 1970 could no longer be achieved. However, it should not be concluded that planning is necessarily an academic exercise; planning has a valuable sight-setting function; it can bolster firms' expectations and hence their investment; and it can help to co-ordinate their decisions. Rather, we should recognise that planning is worthless unless combined with Government policies which enable the planned targets to be reached.

(iv) "The Task Ahead".

In the uncertain economic climate after the July measures there was little point in long-range planning. However, early in 1969 the Government published as a Green Paper a new planning document *The Task Ahead: an Economic Assessment to 1972*. It was neither a plan nor a forecast but "part of the consultative planning process". Implementation was to take the form of consultation with the EDC or other representatives of each industry. The document was flexible in that new developments could be accommodated without requiring the whole assessment to be rewritten. There are three sets of projections—lower, "basic" and higher—on the assumptions of a growth rate in real output of 3, 3¼ and 4 per cent per annum respectively. These projections compare with an actual growth rate of 3·3 per cent per annum between 1960 and 1966.

In fact, the outcome again proved to be well below expectations. Between the first quarter of 1969 and the first quarter of 1972 real output rose only by about 2 per cent per annum. But this time the balance of payments could not be blamed for the shortfall. Instead it appeared that the stagnation was due to a loss of confidence by private investors, and to the monetary and fiscal policies of successive Governments concerned about the acceleration of inflation.

(v) A Stop to Growth?

Like many other oil-importing countries both developed and less developed, the United Kingdom faced a major threat to her continued economic growth as a result of the oil crisis and subsequent rocketing in the price of oil. Estimates made early in 1974 suggested that real gross domestic product was unlikely to rise by more than 2·5 per cent between end-1973 and end-1974, and might well fall; and that, because of the increased oil price and the need for additional taxation, real personal disposable income would fall by between 4 and 7 per cent. Nor did the prospects for business investment, and therefore for future growth of production, appear good. The economic situation should improve greatly in the late 1970s and 1980s as oil production in British waters increases. In the meantime, the economy could be hampered by its vast balance of payments deficit should the Government prove unable to borrow in order to finance a continued deficit.

Regional Planning.

Much publicity has been given since the early 1960s to the varying degrees of prosperity and levels of unemployment in the United Kingdom (*see* G11–12). Government measures are necessary

to reduce disparities and probably even to prevent them from growing.

There are essentially two ways of tackling the problem of regional imbalances: taking jobs to the people or bringing people to the jobs. In so far as the latter alternative is chosen, the Government should encourage the mobility of labour, *e.g.*, through retraining schemes or a rehousing subsidy. However, the migration of population may damage community life in the denuded areas, and cause congestion, housing shortages, and overcrowding in the booming regions. The Government can create employment opportunities in the relatively depressed regions in various ways. It can try to induce expanding industries to set up new plants in these regions by offering tax incentives; it can authorise additional expenditure on public works —*e.g.*, by accelerating road-building programmes —to provide additional employment; it can place orders for the goods it needs—*e.g.* defence contracts—where work is required.

(i) Labour's Policy.

On taking office in October 1964, the Labour Government made regional planning the responsibility of its Department of Economic Affairs. Britain was divided into eight regions, with the intention of producing a plan for each region. The Government also established two kinds of planning body: regional economic planning Councils and Boards to advise on and co-ordinate the planning of each region.

Labour Government policy to cure regional unemployment took the following forms. Various measures to defer public construction programmes excluded the *Development Areas*. Fiscal incentives to locate industry in the depressed regions were given, *e.g.*, the cash grants provided in 1966 for new plants and machinery in manufacturing were at twice the national rate in the Development Areas. By contrast, office building in the main conurbations, London and Birmingham, was strictly limited. To encourage the mobility of labour, the Government introduced redundancy compensation and achieved some expansion in both public and private training facilities. In 1967 regional differentials in the selective employment tax were introduced (*see* **G49**). Under this scheme manufacturers in Development Areas were paid £1·50 per week for each full-time adult male employee and lower amounts in respect of other workers; so giving the Development Areas a wage cost advantage in manufacturing of 5–10 per cent.

In 1965/6 special assistance to industry in the Development Areas was only £29 million. The estimate for the financial year 1970/1 was £309 million; taking the form mainly of the Regional Employment Premium and investment grants.

(ii) Conservative Policy.

In 1970 the incentive to invest in the Development Areas was affected by the Conservative Government's replacement of cash grants by a system of initial allowances against tax. Whereas cash grants had been 40 per cent of investment in plant and machinery in Development Areas and 20 per cent in other areas, there was now to be free depreciation in Development Areas and 60 per cent initial allowances in other areas.

Early in 1972, with the national unemployment rate no less than 3·7 per cent, unemployment rates in Northern Ireland, Scotland, Wales and Northern England had reached appalling levels. At the time of the Budget the Government produced a White Paper on regional development. In the Budget the Chancellor had introduced free depreciation throughout the country on all investment in plant and machinery (*see* **G42–3**): the previous preferential treatment of investment in Development Areas was therefore ended. Instead *regional development grants*, in the form of cash payments towards investment in plant, machinery and buildings, were introduced. These were to be made by *regional industrial development boards*, at rates equal to 22 per cent of investment expenditure in Special Development Areas and 20 per cent in Development Areas and Intermediate Areas. The Government also proposed in four years to triple expenditure on retraining facilities, and to pay a worker who had undergone retraining a rehousing grant of £600 if he moved house to take a new job; and also £400 to any worker in an assisted area who moved house to take a new job. It should be remembered, however, that strong measures were necessary merely to replace the Labour Government's system of cash grants, and the Regional Employment Premium which was to be phased out beginning in 1974.

In January 1974, when unemployment in the United Kingdom averaged 2·8 per cent, it was as low as 1·6 per cent in the South East Region and no less than 4·7 per cent in the North, 4·5 per cent in Scotland and 6·0 per cent in Northern Ireland. In his March budget the incoming Labour Chancellor of the Exchequer announced that the Regional Employment Premium would be continued.

Inflation.

(i) Wages and Prices.

Retail prices continued to edge upwards in the 1960s (*see* **G19–20**). In 1973 they were 72 per cent higher than in 1963. Very little of this increase can be attributed to an increase in import prices. To explain the inflation we must look at

AVERAGE RETAIL PRICES, WEEKLY EARNINGS, REAL WEEKLY EARNINGS AND REAL DISPOSABLE INCOMES
1963 = 100

	Retail prices	Weekly earnings	Real weekly earnings	Real disposable incomes
1958	89·6	78·4	87·5	81·5
1963	100·0	100·0	100·0	100·0
1964	103·3	107·1	103·7	104·2
1965	108·2	115·1	106·4	106·4
1966	112·5	122·5	108·9	108·5
1967	115·3	126·2	109·5	110·0
1968	120·7	136·8	113·3	112·1
1969	127·2	147·5	115·9	112·5
1970	135·3	165·1	122·1	116·5
1971	148·1	182·7	123·4	118·2
1972	158·6	205·1	129·3	126·6
1973	171·6	233·5	136·1	133·9

the behaviour of labour costs. Between 1963 and 1973 the nationally negotiated weekly wage rates rose by 112 per cent, and weekly earnings—including overtime payments and payments negotiated on the factory floor—by 133 per cent. Since the increase in productivity during this period was slow, income from employment per unit of output (indicating labour costs per unit of output) rose by 73 per cent. These increased costs were passed on to the public in the form of increased prices, so that real earnings rose by only 36 per cent. The table shows annual average prices, earnings, real earnings, and also real disposable incomes (*i.e.*, the purchasing power of total personal incomes after income tax), all as indexes with 1963=100.

(ii) The Growing Inflation.

A disturbing feature of the table is the growth in the rate of inflation in Britain after 1967. Between 1968 and 1969 retail prices rose by 5·5 per cent, between 1969 and 1970 by 6·5 per cent. between 1970 and 1971 by 9·5 per cent, between 1971 and 1972 by 7·1 per cent and between 1972 and 1973 by 9·2 per cent. The increase in average weekly earnings rose also.

Why has there been this acceleration in the rate of inflation? In 1968 and 1969, it resulted partly from the increase in import prices consequent upon the devaluation of the pound in November 1967 (*see* **G34**), partly from the increase in indirect taxes introduced after devaluation in order to free resources for exports (*see* **G41**), and partly from the spurt in money wages when the Government's incomes policy weakened (*see* **G47**). But in 1970 the blame could be placed squarely on the " wage explosion ". Normally money wages rise more rapidly the greater the pressure of demand in the labour market (*see* **G20**). But with unemployment high in 1970, pressure of demand for labour could not be the explanation. Rather, the wage explosion appeared to reflect a general increase in

militancy by trade unionists angered by the near-stagnation of real earnings and real disposable incomes after 1967 and possibly influenced by events in other countries (*see* below) Once begun it was maintained by the growth of expectations that prices would continue to rise rapidly.

In 1970 there was a sharp increase in real earnings (by 5 per cent), implying a decline in the share of profits. This share (gross trading profits as a proportion of domestic income) is normally low during a recession, but the share in 1970 dropped to 10 per cent compared with 14 per cent in the recession of 1962. The share rose in 1971 when the increase in labour costs had a delayed effect on prices: retail prices were up by no less than 9 per cent on 1970. There was a danger that this in turn might set off further wage demands and so maintain, or even accelerate, a vicious spiral of inflation. Indeed, that is what happened in 1972 Both wage and price increases accelerated, and the Government was forced to intervene in November by introducing a pay and price standstill (*see* G48). The inflation of 1972 was caused mainly by increased wage payments, although the effective devaluation of the pound in June and the rising world prices of food and raw materials also contributed, both directly to prices and indirectly through their effects on wage demands. The rising price of imports—particularly of food which accounted for half of the 10 per cent increase in the cost of living between end-1972 and end-1973—was mainly responsible for the inflation during 1973, but labour costs also rose markedly.

(iii) International Inflation.

The acceleration of inflation in Britain coincided with similar trends in other countries, including the United States, Japan, W. Germany, France, and Italy, as the table shows. It is also apparent that inflation has generally been more rapid in the United Kingdom than in the other countries since 1968.

Was this the result of a series of coincidences; did the inflations have a common cause; or were they "contagious"? Both France and Italy had major strikes and subsequent "wage explosions"; Britain's inflation too was "cost-push" not "demand pull" in character (*see* G4); Japan and W. Germany experienced strong demand pressures; and in the United States the price increases could be explained as a lagged reaction to the demand pressure of 1966–69. Nevertheless, it is likely that inflation was to some extent transmitted from one country to another—particularly from the United States and particularly to small, trading countries—through its effects on the prices of imports and exports, and possibly through its effects on workers' expectations. In all countries, whatever the initial impetus to the inflation, expectations came to play an important rôle in sustaining it.

Policies against inflation were also similar. Heartened by the apparent success of the statutory wages and prices policies introduced in the United States in August 1971, a growing number of European countries, including the United Kingdom, introduced or tightened direct controls on pay and prices. But these policies did not prevent inflation from accelerating. The sharp increase in inflation experienced by all the major economies in 1973 reflected the rising prices of primary products in world markets. World inflation could be expected to accelerate further during 1974 as the increased oil price had its full effect on costs and prices in the industrial countries.

Incomes Policy.

Britain's competitive position in world trade has deteriorated relative to that of her main rivals the United States, West Germany, and France; hence her balance of payments difficulties. The British share in total world exports of manufactures fell from 17·7 per cent to 12·3 per cent between 1959 and 1967; and further, to 9·3 per cent, between 1967 and 1973. There are essentially two methods of remedying this situation. We must secure either a relative fall in the external value of the pound, or a relative rise in its internal value. In other words, either there must be a devaluation of the pound in terms of other currencies, or we must have a policy to limit the increase in the British price-level. Up to 1967 the Government concentrated on the latter alternative; and attempts were made to introduce some form of *incomes policy*. In 1967 and 1972 the Government opted for devaluation; but incomes policy was still necessary if the devaluation was to be successful.

Other harmful effects of inflation, giving rise to the need for some form of incomes policy, are discussed on G20–1.

(i) The Pay Pause.

In July 1961 the Chancellor of the Exchequer called for a "pause" in wages, salaries, and dividend payments. Exhortations for restraint have been a familiar feature of ministerial statements for many years, but on this occasion the Government soon made it clear that it intended to use such power as it has to influence the amount and timing of wage and salary awards. It has power to decide when the pay awards recommended by the Wages Councils—which fix minimum wages for 3½ million workers—shall be implemented. The Government's power is strongest over workers which it directly or indirectly employs, *e.g.*, civil servants, teachers, and Post Office workers. Their pay awards were cut back. The Government also had a limited influence on awards made in nationalised industries.

The "pay pause" came to an end in April 1962. It was envisaged as a temporary policy, and its effects are difficult to assess. It certainly postponed some wage awards which would otherwise have been made in that period, and it may have contributed to a stiffening of resistance to wage claims. But because the pause affected some groups of people more severely than others, this form of incomes policy was seen to be discriminatory.

(ii) The National Incomes Commission.

In February 1962 the Government issued a White Paper which outlined its incomes policy for the period after the pause. It stated that "the objective must be to keep the rate of increase in incomes within the long-term rate of growth of national production. . . . In recent years national production has risen by about 2 to 2½ per cent a year. . . . It is accordingly necessary that the increase of wages and salaries, as of other incomes, should be kept within this figure during the next phase." The Government stressed that most of the arguments which had in the past been advanced in justification of wage and salary claims—*e.g.*, increases in the cost of living, trends in productivity or profits in particular industries, and comparisons with levels or trends in other employments—should be given less weight; and that "general economic considerations"—*i.e.*, the

RISE IN CONSUMER PRICES

*Annual average.

increases which the economy can afford given the prospective rate of increase in national production —should be given more weight.

Late in 1962 the Government set up the *National Incomes Commission* (NIC). However, the powers of this body were limited. It could not participate in, nor comment upon, wage claims while negotiations were in progress unless the parties involved consented; and as the T.U.C. did not intend to co-operate with the Commission, such consent was unlikely. It could be asked to report on inflationary settlements which had been reached (unless the settlement was reached by arbitration); but it had no power to cancel or modify an agreement. NIC produced only 4 reports, and was wound up after the change in Government.

(iii) The National Board for Prices and Incomes.

In October 1964 the Labour Government's new Department of Economic Affairs was made responsible for achieving an incomes policy. The lessons of the past had been learned; the Government recognised that a successful incomes policy would require the support of both sides of industry. Its first objective was to achieve a "Joint Statement of Intent on Productivity, Prices and Incomes"; this was signed in December 1964. In this document the T.U.C. and the employers' organisations undertook to co-operate with the Government in producing an effective machinery for the implementing of an incomes policy.

It was Government policy that growth in earnings per employee should equal the planned growth in national output per employee of 3–3½ per cent per annum. Thus, in those industries (*e.g.*, engineering) in which productivity growth exceeds this "norm", earnings should rise less rapidly than productivity, and in those industries (*e.g.*, railways) in which productivity growth falls short of the norm, earnings could rise more rapidly than productivity. Moreover, prices would be expected to fall in industries such as engineering, and permitted to rise in industries such as railways. Growth in earnings per employee should exceed the norm only in exceptional cases; *i.e.*, as a reward for increasing productivity by eliminating restrictive working practices; if necessary to transfer labour from one industry to another; if earnings are too low to maintain a reasonable standard of living; or if a group of workers have fallen seriously out of line with earnings for similar work.

To make specific recommendations on the basis of this policy, the Government set up a *National Board for Prices and Incomes*. It consisted of an independent Chairman, a number of independent experts, a businessman and a trade unionist. The Prices Review Division of the Board could investigate the price of any goods in the economy, and the Incomes Review Division had power to investigate all claims and settlements relating to wages, salaries, and other incomes. In less than 5 years of operation the Board had produced over 150 reports on prices and earnings.

There was no statutory authority to enforce the recommendations of the Board: reliance was placed on voluntary methods and the power of persuasion and public opinion. However, in late 1965 the Government introduced a compulsory "Early Warning" system, where by it was notified in advance of any intended increase in incomes or in certain prices. As a result, the Government and the Board had time to consider increases before they were put into effect.

(iv) The Prices and Incomes Standstill.

A voluntary incomes policy is very difficult to implement, since it depends on co-operation among Government, workers, and employers; moreover, co-operation among representatives at the top may be undermined by "wage-drift" at the factory level. Thus the annual average of weekly wage-rates rose by no less than 6 percentage points between 1965 and 1966. In fact all of this increase took place in the period before July 1966. Clearly the voluntary incomes policy was meeting with little success.

Therefore, as part of the July measures taken to deal with the balance of payments problem, the Government introduced a "prices and incomes standstill." Increases in prices and incomes were as far as possible avoided altogether until the end of 1966. The only exceptions in the case of incomes were pay increases resulting directly from increases in output (*e.g.*, piece-work or overtime earnings) and from genuine promotion or regular increments on a predetermined scale. Increases already negotiated but not yet implemented were deferred for 6 months. The first half of 1967 was a period of "severe restraint." Any price increases were carefully examined, and the norm for income increases was zero. Any increase in earnings had to be justified by one of the four conditions for exception, referred to above. To enforce its "freeze" the Government took the unprecedented step of asking Parliament for reserve powers, which were to be used only if the need should arise. These powers—including penalties for offenders—were contained in the new Part IV of the Prices and Incomes Act. For the most part, there was a voluntary observation of the standstill; but from October 1966 the Government found it necessary to exercise its power of compulsion in a few cases, *e.g.*, laundry and dry cleaning charges, and a wage agreement in the electrical engineering industry. The power of compulsion lapsed in August 1967.

The period of compulsion was followed by a year in which there was to be a "nil norm" except where increases in incomes could be justified by one of the four criteria listed above. The Government could no longer legally enforce its policy, but it did retain the power to delay price and pay increases, through reference to the Board, by up to 7 months. Whereas the Government succeeded in almost stabilising wages and prices during the year in which it took compulsory powers, in the second half of 1967 weekly wage rates rose by 6 per cent. The advantage gained from the previous restraint was reduced but not entirely lost.

(v) Incomes Policy after Devaluation.

Incomes policy was made both more difficult and more important by the devaluation of the pound: more difficult in that devaluation involved a cut in the standard of living, and more important in that the trading benefit from devaluation should not be neutralised by inflation.

In April 1968 the Government published a White Paper outlining its policy for the period until the end of 1969. Wage increases had still to be justified by the four criteria, and there was a "ceiling" to increases in income of 3½ per cent per annum except for "productivity agreements" and low-paid workers in certain cases. Price increases were permitted only as a result of unavoidable increases in cost per unit of output, and price reductions were required when costs fell. Dividend increases were also subject to the ceiling of 3½ per cent per annum, and home rent increases restricted. The Government intended to rely on the voluntary co-operation of unions and employers over pay; but it decided to lengthen its delaying powers for pay and price increases up to 12 months, and take powers to enforce price reductions recommended by the Board.

Between November 1967 and November 1968 the retail price index rose by 5·2 per cent, mainly due to the effect of devaluation on import prices. In the face of this rise in the cost of living the incomes policy met with firm resistance. In practice the nominal ceiling of 3½ per cent per annum rapidly became the normal increase. In the first year after devaluation basic wage rates rose by 6·0 per cent and average earnings by 7·5 per cent. Workers were able to protect themselves against the inflation and to increase slightly their real incomes.

During 1969 the process of wage and price inflation accelerated. Between November 1968 and November 1969 average earnings rose by 8·0 per cent and retail prices by 5·4 per cent. In December the Government published a White Paper on its incomes policy for the period after 1969. It laid down a norm for wage increases of 2·5 to 4·5 per cent per annum: increases should exceed the upper limit only in exceptional circumstances, *e.g.*, in productivity agreements, in cases where an inappropriate pay structure is rationalised *e.g.* by means of job evaluation, in the case of low-paid workers, and in the achievement of equal pay for women. Comparisons with other workers should not be used, except in the case of public servants

(*e.g.*, teachers and nurses) whose productivity cannot be measured and whose pay tends to fall behind that of the private sector. The limit on the increase in company dividends of 3·5 per cent per annum was ended and the Government powers to delay the implementation of proposed wage and price increases were reduced. However, the incomes policy laid down in the White Paper was tempered by the imminence of a General Election and the recent cost of living increases; and it did not prevent a "wage explosion" occurring in 1970.

(vi) Conservative Policy.

On taking office in June 1970 the Conservative Government eschewed its predecessor's approach to incomes policy and disbanded the National Board for Prices and Incomes. To curb the inflation it maintained the economy in recession and squeezed company liquidity, hoping in this way to weaken wage pressures and strengthen the resistances of employers. In addition it attempted to resist demands for wage increases in the public sector, at the cost of prolonging strikes, *e.g.*, in electricity supply, postal services and coal mining. In the former two cases it met with some success; in the case of the coal miners' strike early in 1972 the Government was unable to enforce its policy. In any case this form of incomes policy—like the "pay pause" of 1961—was both partial and discriminatory. The Government also intervened to curb price rises in the nationalised industries, *e.g.*, postal charges and steel prices. The main initiative on prices came from the Confederation of British Industry (CBI): in July 1971, it asked its members to avoid price increases over the next twelve months or to limit them to 5 per cent or less in unavoidable increases. Over 170 leading British companies agreed to comply.

The Government measures were by no means a sure remedy for the inflation spiral. Moreover, even its apparent strategy of deterring wage demands by maintaining high unemployment was dropped in the reflationary budget of 1972 (*see* G42). The Government appeared to be placing its faith in its Act for the Reform of Industrial Relations to solve the problem of wage inflation in the long run.

(vii) The Pay and Price Standstill.

In 1972 wage demands became more difficult to contain because of the increase in the cost-of-living resulting from the effective devaluation of the pound in June and the rise in world food prices during the year. There was a marked increase in the number and seriousness of strikes (*see* G18). This was fairly widespread, although the national miners' strike accounted for 10·8 million of the 23·9 million working days lost in 1972. Nevertheless, on average only very slightly more than one working day was lost per employee during the year. The principal cause of the rise in disputes was a sharp rise in disagreements over pay claims: this increase being both cause and effect of the rapid inflation. In the six months between the first and third quarters of 1972 average weekly earnings rose by no less than 8 per cent. It was inevitable that the Government should intervene. The expectation of an impending freeze now encouraged further wage and price increases, especially after the CBI's period of voluntary restraint had elapsed.

The Government first tried to achieve a tripartite voluntary agreement with the CBI and the TUC to combat inflation. After this attempt had failed, on 6 November the Conservative Government reversed its previous policy on inflation and introduced a Statutory Prices and Pay Standstill. In effect there was a standstill on all prices of goods and services other than imports and fresh foods, a standstill on rents, on dividends, and on all negotiated wages and salaries including those previously negotiated but not yet in operation. The freeze was to last for 90 days, and possibly for a further 60 days. Offenders were liable to be fined.

(viii) The Price Commission and the Pay Board.

In early 1973 the Government formulated its policy for after the standstill in a series of documents, culminating in a Price and Pay Code. An Act of Parliament established two new agencies: a *Price Commission* and a *Pay Board*. Their function was to regulate prices, pay, dividends and rent in accordance with the Price and Pay Code.

In Stage Two of the policy—lasting from the end of the pay standstill on 31 March until the autumn—the following criteria on pay were to apply. The total annual pay increase for any group of employees should not exceed £1 a week plus 4 per cent of the current pay excluding overtime. There was flexibility for negotiation of increases within a group: emphasis was to be on the lower paid and the maximum allowable increase was £250 a year. Exceptions to the limit were made for, *e.g.*, movement towards equal pay between the sexes, reduction in standard hours worked to not less than 40 hours a week, increased annual holidays up to a three week maximum, personal increments and promotion, and some improved pension benefits. The Pay Board had to be notified of all settlements involving less than 1,000 employees but settlements involving more than 1,000 employees required its prior approval. It became an offence to strike or threaten to strike to force an employer to contravene an order of the Pay Board.

Prices in Stage Two could be increased only to take account of *allowable* cost increases, and were to reflect only the percentage increases in these costs per unit of output since 1 October 1972. Moreover, to allow for productivity growth, firms were permitted to pass on as price increases only a fraction of the increase in the wage costs allowed by the Code. Prices were also limited by the requirement that net profit margins should not exceed the average percentage level of the best two of the last five years. Exceptions were made for companies which could show that without higher profits their investment would be held back. Large firms had to give prior notice of price increases to the Price Commission, medium firms had to report regularly on prices, and small firms had to keep price records. Imports, fresh foods, auctioned goods, secondhand goods and interest charges were among the exemptions from the price controls. Dividends could not be raised by more than 5 per cent over the previous year. The standstill on business rents was extended into Stage Two.

One of the problems facing the price policy was the continued sharp rise in world food prices after the standstill was declared. This made public acceptance of the Government policy more difficult to achieve.

(ix) Stage Three.

Stage Three of the counter-inflation policy was announced in October 1973. Price controls were similar to those under Stage Two. Wage increases negotiated for any group of workers would be statutorily limited to an average of either £2·25 a week per head, or if preferred, 7 per cent per head, with a limit of £350 a year on the amount to be received by any one individual. However further increases were permitted beyond these limits, to deal with certain specific matters: changes in pay structures, better use of manpower, efficiency schemes, "unsocial" hours, and progress towards equal pay for women. A novel aspect of the pay policy was the *threshold agreement* to safeguard against increases in the cost of living. It was possible for wage negotiators to bargain for a pay increase of up to 40p a week, payable if the retail price index reached 7 per cent above its level at the beginning of Stage Three, with up to another 40p a week for each percentage point it rose thereafter until the end of Stage Three in November 1974.

(x) The Miners' Strike.

An increasing number of settlements were made under the Stage Three conditions; the number of workers covered rising to over 6 million by the end of February 1974. The National Union of Mineworkers, however, feeling strongly that their relative pay had fallen and recognising their new bargaining powers resulting from the oil crisis, refused to settle under Stage Three. A national overtime ban was begun in November, which in January 1974 became a national strike. In November the Government declared a State of

Emergency and in January introduced a three-day week for industry, in order to conserve coal and electricity (which depended on coal). It was unwilling to waive the Stage Three legislation in the miners' case, despite a declaration by the Trade Union Congress that its member unions would not invoke a settlement of the miners' dispute in support of their own claims. By using the maximum flexibility permitted in the legislation, *e.g.*, on payment for unsocial hours, the National Coal Board had been able to offer an average increase of some 17 per cent within the Stage Three rules. The Government referred the NUM claim to the Pay Board, for the Board to determine whether the miners constituted a special case which justified a further increase in their relative pay. The Government then called a General Election. The Pay Board reported just after the election, and recommended that an additional increase be paid, on the grounds that the long-run contraction of the industry would in future be reversed and that higher relative pay would be necessary to recruit and retain sufficient mineworkers. The recommendations were immediately accepted by the incoming Labour Government.

(xi) Incomes Policy under Labour.

The Labour Party came to power pledged to deal firmly with prices but to abandon statutory wage controls. It took early action on house rents and food prices, by means of controls and subsidies, but did not give priority to ending the Stage Three legislation. Owing to the sharp increase in import prices in the first few months of Stage Three, the threshold agreements negotiated under Stage Three would soon be activated. Through the unfortunate timing of their introduction, it seemed that these agreements, intended to moderate wage claims by offering workers security against inflation, would in fact accelerate the inflation.

Whether the Labour Government could responsibly abandon statutory controls on pay would depend very much on the "social contract" announced between the TUC and the Labour Party during the February election campaign. It remained to be seen whether, in return for repeal of the Industrial Relations Act and various measures for the redistribution of income from the rich to the poor (*see* G43), the TUC would be able to persuade its member unions to accept voluntary restraint in their wage claims during a year of probably declining real incomes.

(xii) Relativities.

In January 1974 the Pay Board produced an important advisory report entitled *Problems of Pay Relativities*. Pay relationships between groups of employees—relativities—lie at the heart of pay determination. Relativities are influenced by bargaining strength and market conditions: often they conflict with people's views of fairness. A successful incomes policy must allow for some flexibility in relativities without setting off a process of leapfrogging wage increases intended to restore relativities.

The Pay Board proposed a procedure for considering special claims by particular groups for an improvement in their relative positions. The cases possibly eligible for special treatment should be selected by the Government in consultation with the Confederation of British Industry (CBI) and Trade Union Congress (TUC), based on criteria to be worked out by the parties. There should then be a detailed public examination of each case, at which the views of all affected parties could be heard. It was hoped that a sufficient degree of public consensus would be achieved in this way for any resultant decision to be generally accepted as a valid exception to the incomes policy rules.

Tax Reforms.

(i) Capital Gains Tax.

The first move in this direction was the introduction of a tax on short term gains in 1962. But a more comprehensive innovation was the *capital gains tax* of 1965. This tax is levied on the gain realised on an asset between its purchase and sale, provided this does not exceed the gain between 6 April 1965 and sale. It applies to all assets, with limited exceptions: the most important being owner-occupied houses, and goods and chattels realised for less than £1,000. Gains realised by companies over any period are taxed at corporation tax rates. Gains by individuals on assets held for more than a year are taxed at a flat rate of 30 per cent. Gains realised within a period of one year were treated as ordinary income and taxed accordingly. However, in his 1971 Budget the Chancellor made these gains also subject to the 30 per cent flat rate. He also exempted individuals' capital gains where the assets sold during the year were valued at less than £500, and taxed individuals at their personal income tax rate on only half their gains up to £5,000. The 1972 Budget effectively eliminated double taxation on unit trust capital gains.

There are many administrative difficulties in implementing such a tax. Nevertheless, it is an important attempt to remedy the inequality in the taxation of earned and unearned incomes (*see* G16).

(ii) Corporation Tax.

In 1965 the Labour Government also introduced a *corporation tax*, to replace the existing company income tax and profits tax. This tax, at a rate of 40 per cent, was imposed on distributed as well as undistributed profits, so as to encourage the retention of profits for the financing of business expansion. The tax rate was subsequently raised to 42·5 per cent and then to 45 per cent.

In 1970 the incoming Conservative Government reduced the rate of tax to 42·5 per cent and in 1971 to 40 per cent. It was also announced that the Government intended to remove the discrimination in favour of retained and against distributed profits, by decreasing the rate on distributed profits so that the burden of corporation tax and income tax together would be equal to the corporation tax alone on retained profits. This would have the effects of reducing profit retentions, which would discourage investment, and of easing share issue, which would encourage investment. The new corporation tax was introduced in 1973, and there was preferential treatment for small companies with profits of less than £25,000 a year. In the March 1974 budget the Chancellor set corporation tax for 1973–74 at a rate of 52 per cent.

(iii) Selective Employment Tax.

The *selective employment tax* (SET) was introduced in the 1966 Budget (*see* G41), became partly an instrument of regional policy in 1967, and was raised in both the 1968 and 1969 Budgets. At its height the tax per full-time adult male was £2·40 per week. In 1970 the Labour Chancellor announced that it would become related to earnings rather than to numbers employed as from 1972. However, the Conservative Chancellor announced that SET would be halved as from July 1971 and abolished when VAT was introduced in 1973.

All employers were required to pay this tax, at different weekly rates for men, women and boys and girls; but manufacturing firms and the public sector received a refund. It was a selective tax on services and construction. The tax therefore discriminated against those industries which are labour-intensive, export little, and whose output bears little indirect taxation. The SET was therefore a rough and ready means of forcing employers to release hoarded labour, of subsidising exports, and of evening up the incidence of indirect taxation.

In 1970 Professor Reddaway having been asked by the Treasury to investigate the effects of SET, produced the first of his Reports. This covered the distributive trades which account for no less than 2·8 million workers. The Report used statistical analysis to show that the growth in productivity in the distributive trades after 1965 was well above the rate expected in the absence of SET, and that profit margins and prices were lower than expected. The discrepancy could not be attributed entirely to SET, however, because other abnormal factors, *e.g.*, the progressive abolition of resale price maintenance (*see* G14), operated during that period. On the whole the Report was favourable to SET.

(iv) Value Added Tax.

In his 1971 Budget the Chancellor of the Exchequer announced that SET and purchase tax would be replaced by a *value added tax* (VAT) in April 1973. A value added tax was seen to have certain advantages: it could be applied evenly to almost all goods and services unlike purchase tax which was imposed on only a limited range of goods; without infringing international rules exports could be exempted from the tax and so encouraged; and it would be in line with practice in the Common Market countries.

The tax is levied as a certain percentage of *value added* at each stage of production (*see* G12). Here is a simple example on the assumption of a uniform 10 per cent rate. A producer imports raw materials valued at £100 and pays a tax of £10. He makes an intermediate product and sells it to a manufacturer for £200. The producer's value added is £100, so he pays another £10. The manufacturer makes a final product and sells it to a retailer for £500. His value added—accruing either as wages to his workers or as profits—is therefore £300, and he pays tax of £30. The retailer sells the product to domestic consumers for £700, his value added being £200 and his tax liability £20. The sum total of tax paid is £70, *i.e.*, 10 per cent of the final product price, but it is collected at each stage of production.

VAT was initially set at 10 per cent, but the rate was subject to regulation upwards and downwards. In the interests of simplicity there was only one, uniform rate, but there were exceptions. Some activities were exempt from the tax: *e.g.*, insurance, postal services, education and health services, and small firms with turnover of less than £5,000 per annum. These do not pay tax on their sales but cannot reclaim tax on their purchases. Still more favoured were zero-rated activities which could get complete relief from the tax both on sales and on purchases. They included all food for humans, newspapers, periodicals, books, housebuilding, rents, rates, fares, domestic fuel and light, children's clothing and footwear, and of course exports. Because cars are a major source of revenue from purchase tax, there was, in addition to VAT, a separate tax on new and imported cars of 10 per cent. By introducing exceptions—*e.g.*, no tax on food and housing—the Chancellor went some way to meet the charge that the replacement of purchase tax by VAT would widen the gap in living standards between rich and poor.

(v) Income Tax and Surtax.

In the 1971 Budget the Conservative Government proposed to replace the existing income tax and surtax with a single graduated personal tax in 1973. It would have the following four principal features. The existing pattern of personal allowances would be retained, there would be a basic rate covering a broad band of income and corresponding to the standard rate less earned income relief, there would be higher rates above the basic rate applicable to the higher incomes, and the distinction between earned and unearned income would be made by way of a surcharge on investment income above a certain level of such income. The purpose of the proposals was to simplify tax assessment and collection to avoid misunderstanding as to the true marginal rates of tax, and to encourage saving.

In the 1972 Budget the Chancellor, giving further details of the 1973 innovation, announced that on the first £5,000 of annual taxable income, the personal tax would be charged at the basic rate of 30 per cent. On the slice of income between £5,000 and £6,000 it would be 40 per cent, and it would reach a maximum of 75 per cent on the slice of income in excess of £20,000. There would be a surcharge of 15 per cent on investment income only above £2,000. These changes implied a much simpler system, but one in which the rate of tax increased less rapidly with income than before, *i.e.*, it was a less *progressive* tax.

In the March 1974 Budget the Chancellor in the incoming Labour Government took measures to make income tax more progressive. The standard rate was raised to 33 per cent but personal and child allowances were increased. Additions to the standard rate begin at a taxable income of £4,500 per annum and the surcharge on investment income at £1,000 (£1,500 for the over 65s). The maximum rate of tax was raised to 83 per cent (98 per cent for investment income).

(vi) Gifts Tax.

It has been possible to avoid estate duty by making gifts some years before death. In his 1974 Budget the Chancellor announced that he would introduce a *gifts tax*, retrospective to March 1974, to close this loophole. By this means he hoped to break up the concentrations of private wealth which had been transferred from one generation to another. The gifts tax would mesh in with existing estate duty so as to cover all transmissions of personal wealth. The tax would fall on the donor rather than on the recipient.

(vii) A Tax-Credit System.

The Conservative Chancellor announced in 1972 that he was considering a radical reform of personal taxation which would integrate the systems of taxation and social security. This was a tax-credit scheme in which the various tax allowances would be abolished and replaced by a simple system of credits, payable whether or not the recipient was a taxpayer. The proposals were set out in a Green Paper in October of that year.

At present low earners not paying tax do not receive any benefit from tax allowances. The proposed tax scheme opens the possibility of *negative income tax*, *i.e.*, of low earners actually receiving a subsidy. The employer would deduct tax from the pay of each employee at the standard rate (say 30 per cent) and against this tax the employer would set the amount of credit to which the taxpayer was entitled (say £4 for a single person, £6 for a married person, and £2 for each child). If the credit exceeded the tax the difference would be paid to the employee. For those not in employment the credits would be available from a Government department. To give an example of negative income tax: a married man with 3 children earning £20 a week would pay £6 tax on the £20 but would qualify for £12 credits on our assumptions; his income after tax therefore being £26. But at present, because he pays no tax, he cannot benefit from tax allowances. The scheme would reduce reliance on supplementary benefits and family income supplements (*see* G42), and the assistance would be automatic. The extent of assistance to poor and large families would of course depend on the rates of credit finally laid down.

Means-tested Social Services

In 1972 there existed at least 45 different types of benefits or services which were provided on test of means, some of them administered by Central Government and some by Local Authorities. They included supplementary benefits, free school meals, rent and rate rebates, legal aid, free welfare milk and foods, higher education awards, dental and optical charges, and family income supplements (*see* G26–27). The selective system has grown in recent years, in three ways: an increase in the number of such benefits and in the number of families qualifying, and a restriction of benefits which were formerly universal.

Means-tested schemes have been criticised on four main grounds: it is argued that they are expensive to operate; that they reduce the incentive to work or to earn more (there are cases in which additional income is entirely neutralised by loss of selective benefits); that they are considerably under-utilised through ignorance or pride (probably only two-thirds of those eligible for supplementary benefits, only half of those eligible for free welfare milk and food, and only a third of those eligible for rate rebates actually receive them); and that they are socially divisive. A tax-credit system would be capable of reducing the need for the various means-tested benefits currently provided to alleviate poverty and of avoiding the defects to which critics have pointed; but much would depend on the precise details of the system.

THE CONTEMPORARY THEATRE

In recent years a new kind of theatre has been created under the influence of writers able to break with convention and experiment for themselves, making more imaginative use of stage and language. This section concerns the English theatre since 1950.

TABLE OF CONTENTS

I. Introduction 3–7

The Function of Dramatic Art
The therapeutic effect of drama
The Constituents of Drama
The ritual element

THE CONTEMPORARY THEATRE

This section concerns the English theatre since 1950 and since a shared experience between actors and playgoers has long been vital to the full enjoyment of drama it is limited to plays acted live to a live audience. There are four sections:

I. Introduction
II. Eminent Theatrical Groups
III. Glossary of Dramatic Terms
IV. Individual Dramatists

I. INTRODUCTION

Agatha Christie's *Mousetrap* is in its third decade and most West End theatres still show the realistic well-made play and social comedy popular between the wars, yet the most highly-valued plays of 1973 were very different. The theme of both Hampton's *Savages* and *Sizwe Bansi* by Fugard and his collaborators was glaring social and economic injustice in other continents. Shaffer's *Equus* explored the anguish of the disturbed personality. The only visual images of Beckett's *Not I* were a dimly-lit mouth and a shadowy auditor.

Such plays are more fully appreciated in the context of the many innovations in drama dating from the mid-1950s and this section is concerned with the more significant plays of this period.

The Function of Dramatic Art.

It is not the function of art to make a statement but to induce an imaginative response, and the spectator receives not an answer to a question but an experience.

Drama, like the other arts, gives expression to that subtle and elusive life of feeling that defies logical definition. By feeling is to be understood the whole experience of what it feels like to be alive—physical sensations, emotions, and even what it feels like to think.

This flux of sensibility cannot be netted down in logical discourse, but can find expression in what Clive Bell, when discussing the visual arts, called "significant form."

The contemporary philosopher, Susanne Langer, in her book, *Feeling and Form*, has developed Clive Bell's concept, arguing that all artistic form is an indirect expression of feeling. The artist, be he painter, poet, or dramatist, creates an image, a form that gives shape to his feeling, and it is for the sensitive recipient to interpret its significance.

The especial province of drama, as was pointed out by Aristotle, is to create an image, an illusion of action, that action "which springs from the past but is directed towards the future and is always great with things to come." Both tragedy and comedy depict such action and the conflict which it normally entails.

The Therapeutic Effect of Drama.

One of the achievements of serious drama is to create an image that will objectify and help to resolve deep human conflicts.

Most people have at some time or another come away from a fine play feeling in some inexplicable way exhilarated and released, and it has long been recognised that drama can have a beneficial, even a therapeutic effect.

It is easy to understand the exhilarating effect of comedy but extremely difficult to comprehend that of tragedy. In the 4th cent. B.C. Aristotle claimed that tragedy accomplishes a beneficial purgation of pity and terror (*see* The Aristotelian Play) and Helen Gardner in *Religion and Literature*, 1971, again examines the paradox as to why a dramatisation of catastrophe should give us some kind of release and satisfaction. Discussing such influential theories as those of Hegel, Bradley, Schopenhauer, Nietzsche, Unamuno and Niebuhr, she elucidates the tragic conflict as opposition between such contraries as man and fate, or man's incompatible ideals, or inner conflicts, or reason and emotion. She concludes that the power of tragedy lies in reconcilement of harshly discordant contraries—the passionate protest at inevitable suffering and its agonised acceptance—which realised together have power to console.

Helen Gardner's book is especially relevant today for she denies tragic stature to the modern serious play. Studying two of those rare periods productive of tragedy, she points out that social and religious conditions in 5th cent. Athens had a parallel in Elizabethan London. In both cultures a consciousness of guilt and sin and the need for propitiation and salvation involved a conviction that human action was profoundly significant, helping to create a climate propitious to tragedy which Helen Gardner following Aristotle defines as "the imitation of a complete action."

Today's climate she considers adverse. The contemporary metaphysical despair and sense of meaninglesness together with post-Freudian emphasis on "sickness" rather than wrong-doing have helped to erode a sense of responsibility for actions, so that today's serious play is either eventless, pathetic rather than tragic, or as in the "theatre of cruelty" (*q.v.*), preoccupied with violent event for event's sake, while the unrelieved despair inevitably lacks that conflict of protest and acceptance, which exhilarates and consoles.

Another distinguished woman critic, Muriel Bradbrook, has put forward a most interesting psychological explanation of the effect of serious drama on the audience. She suggests that in watching a mature play we are encouraged to sympathise with many different characters at one and the same time, and it may be that the imaginative effort entailed has a corresponding movement in the unconscious mind. There, at the most primitive level, is an "internal society," the petrified infantile images of father, mother, and siblings, to which we are linked by inflexible attitudes. It may be that the sympathetic response to the playwright's images of these figures helps us to relax our rigid attitudes towards them so that the internal pattern of relationships shifts, and we experience a sense of release and a new access of energy.

It is noteworthy also that drama can be fully appreciated only in a public performance, a social event demanding the co-operation and understanding between author, players, and audience. Because it can flourish only in a community, normally a city, it has been called the metropolitan art.

The Constituents of Drama.

Drama is a complex art in that it uses two very different kinds of ingredient or material, one speech, the literary constituent, the other the gesture, movement, and confrontation of actors

on an actual stage. Speech is man's most precise, subtle, and mature means of expression. Gesture and confrontation, which he shares to some degree with animals, is more primitive and some of the power of drama as an art form is its fusion of civilised speech and primitive gesture into one organic whole.

It is just possible to conduct brief scenes using only one of these media. The chorus in Shakespeare's *Henry V* is virtually confined to speech and there is in Galsworthy's *Justice*, revived in 1968, a remarkable wordless scene, showing a criminal in solitary confinement in his cell, that proved so moving that it is reputed to have led to an amendment of the penal code.

Perhaps the more primitive gesture has the greater emotional force, but it is the words made permanent in the literary script that up till now have constituted the commanding form of drama. Even the wordless mime is given permanence by the printed script.

The Ritual Element.

While speech and the confrontation of actors are essential to full drama, there is an element that has sometimes been neglected and that is ritual, perhaps the most primitive and evocative of all. The early tragedy of Greece was probably organically connected with the religious ritual of Dionysus and the matrix was song and dance. Similarly in England the origins of drama are to be found in church liturgy and ritual and civic occasion, both of which used procession, pageantry, costume, and symbolic insignia to great effect and also clowning which served as comic relief to the solemnity.

There have naturally been few dramatists who have been able to combine literary ability, a sense of stage situation and also skill in the use of ritual process. The enduring power of Shakespeare is due to his manifold genius in that he could deploy inimitable poetry, swift action, and such ritual enrichments as royal processions, crowning and dethroning, duelling and wrestling, masque and pageantry, song and dance.

The Background of Modern Drama.

The happy fusion of both literary and theatrical excellence which is to be found in Shakespeare's plays is extremely rare, for it demands not only a versatile genius but also a receptive audience and a suitable building. By the Restoration the delicate balance was already disturbed and by the middle decades of the 19th century popular taste had all but banished literature from the stage. The disorderly audiences of the time demanded only spectacular and sensational theatrical and musical effects, and in the vast monopoly theatres of Drury Lane and Covent Garden they could hardly have heard, let alone appreciated, good dialogue. The managers discouraged men of genius, so that poets like Browning, who had no practical knowledge of the theatre, produced wordy "closet dramas," which were virtually unactable, while the popular theatrical melodramas like *Maria Marten* or *Murder in the Red Barn*, are today unreadable.

With the gradual establishment of smaller theatres, catering for a sober middle-class audience, men of talent again began to write for the stage. It was the turn of literature to take command, and more popular and traditional techniques such as music and clowning were now banished to the music-hall and pantomime.

T. W. Robertson, Henry Arthur Jones and Pinero all furthered the trend towards realism but it was the genius of Ibsen, especially in such works as *Ghosts* and *The Wild Duck*, that set a high standard of excellence for the literary and realistic play of middle-class life. He expressed his profound insight into personal and social problems in finely constructed plays, written in naturalistic prose, the overtones of poetic universality being conveyed in symbolism that was usually verbal.

Able writers, like Granville Barker and Galsworthy, although they lacked the poetic power of Ibsen, firmly established in England a similar type of literary play, realistic, well-constructed, serious-minded, concerned with the middle class and almost exclusively verbal.

Some of the few exceptions to this preoccupation with the realistic and literary are to be found in Shaw. Like Shakespeare, he was not only a literary genius. He was also well acquainted with stage-production and although much too wordy in old age, in his best comedies he combined some of the wittiest dialogue to be found in English drama along with the delightful shocks and surprises of total theatre. Androcles' engaging Lion belongs to the same family as Titania's Ass and Whittington's Cat.

But Shaw in his prime was unique, and between the wars the verbal, realistic play was perpetuated by such writers as Maugham and Coward. Not over-concerned with psychological or social issues, they used it to portray the leisured classes.

By the 'forties the conventional West End play had with a few exceptions come to imitate not life but photography. Confined to the proscenium arch and realistic to the last trivial detail, it presented a prosaic picture of middle- and upper-class life, with stereotyped situation, demanding only stock responses and lacking interest in ideas, poetic intensity, and genuine wit. With the star cast and the long commercial run, theatre-going had become not an artistic experience but a social occasion.

Apart from the novel comedies of such writers as Ustinov and Rattigan and the verse plays of T. S. Eliot and Fry, it was the revivals of the classics, English and European, that were bringing genuine drama to the stage. Shakespeare could be enjoyed not only at Stratford and the Old Vic, but in the West End. It was largely due to Gielgud that Shakespeare was now a box-office draw.

Gielgud's fine histrionic sense, and his highly sensitive and poetic interpretation had earned him that rare distinction of being the Hamlet of his generation and as early as 1934 his production and performance at the New Theatre had broken all records since Irving.

As actor and producer, working with other fine artists, such as Edith Evans, Peggy Ashcroft, Olivier, Guinness and Scofield, Gielgud later confirmed his success. Enthralling interpretations of plays by Shakespeare, Webster, Otway, Congreve, Sheridan, Wilde and Chekhov demonstrated that the classics could have a wide popular appeal.

Other artists followed and in a successful season at the New Theatre, Sybil Thorndike, Olivier and Richardson played to crowded houses in *Oedipus*, *Henry IV*, *The Critic* and *Peer Gynt*.

Such achievements reminded audience and aspiring playwright that there are many other dramatic styles than that of fashionable realism and so may even have helped to further the dramatic revival that began in the 'fifties.

The Modern Revival.

Although artistic work overflows the tidy schemes of chronology, it is helpful to distinguish two main phases of contemporary drama, beginning with plays produced during the first sudden outburst of creativity.

The decade beginning 1955.

Many new playwrights first became known during an exciting decade. There were British premières of plays by continental writers such as Brecht, Ionesco, Genet, Dürrenmatt, Frisch, Vian, Hochhuth and Weiss and by the American Albee. British dramatists who soon established their reputation included Beckett, Osborne, Behan, Pinter, N. F. Simpson, Ann Jellicoe, Mortimer, Wesker, Arden, Shaffer, Saunders and

Bolt. Most of these, fortunately, still continue to write.

It is never easy to identify causes of artistic renewal but one reason was that young men like Wesker injected new vigour into the jaded realistic mode by using it to express the vital stresses of the working people they knew. Hence the settings in shabby basements and attics (*see* Neo-realism). It was in such a setting in Osborne's *Look Back in Anger* (*q.v.*) that there suddenly exploded that blast of confused and impotent anger which expressed the frustration of so many of his contemporaries.

More far-reaching was the general awareness among avant-garde playwrights that verbalism was not enough, and their readiness to experiment with the resources of "total theatre." Here the way had been shown by scholarly research into the history of the theatre which gave dramatists confidence to revive valid techniques such as song, music and clowning that the early 20th cent. had banished to the music-hall.

The most vital stimulus was the challenge of genius. Brecht's Epic Theatre (*q.v.*) offered a more free and fluid form than that of the "well-made play" (*q.v.*) and his novel uses of traditional theatrical devices (such as song, masks, extravagant costume and settings, direct address to the audience) were quickly adapted by dramatists like Arden, Bolt and Osborne.

Meanwhile Ionesco, whole-hearted devotee of the Theatre of the Absurd (*q.v.*), introduced monsters like the rhinoceros and exploited stage properties like empty chairs to satirise man's frightened and empty existence. He was soon followed by Saunders and by Simpson, whose weighing-machines symbolised the dominance of imagination by machinery. Devices recently restricted to pantomime were returning to the stage.

A pervasive and growing influence was that of Artaud's demand for a Theatre of Cruelty (*q.v.*). This is both the most novel and the most atavistic type of theatre, for it attempts to re-create in modern terms that primitive, even barbaric ritual from which drama evolved. It was clearly exemplified in 1964 in a play by Weiss (*q.v.*) and in England is still best known in translations.

Developments since 1965.

One of the most interesting aspects of recent theatre has been a fresh and topical approach to Shakespeare.

Some critics and producers have traced in his plays the bleak disenchantment of post-war Europe. As early as 1963 Peter Brook had said that his production of *King Lear*, with Paul Scofield as protagonist, owed much to the Polish critic, Jan Kott, whose book *Shakespeare, our Contemporary*, was published here in the following year.

Kott, who lived through the Nazi tyranny and the Stalinist occupation of Poland, urges that the power-politics, chicanery and violence of twentieth century Europe have their counterpart in the Wars of the Roses and the Tudor disturbances. He finds in Shakespeare's Histories and in the Tragedies, especially *Macbeth*, what he terms the "Grand Mechanism" of history, the blood-stained struggle for power with its terrible consequences, and he claims that Shakespeare "condemns war by showing up the Feudal butchery."

The series, "The Wars of the Roses," which was produced for the B.B.C. during 1965–6 by Peter Hall and John Barton with the Royal Shakespeare Company, vividly demonstrated the crime-ridden lust for power and the Feudal butchery. Meanwhile at Stratford and the Aldwych, the production of *Henry V* neglected the traditional, royal splendour and showed the king, grimy and battle-scarred, leading a tattered army, plagued by corrupt camp-followers. Played on a bare, gaunt stage, grey, metallic and cavernous, it was strikingly similar in tone and significance to Brecht's *Mother Courage*, running concurrently at the Old Vic.

Shakespearean comedy has also been approached afresh. In Clifford Williams' enchanting production for the National Theatre in 1967 of *As You Like It*, with an all-male cast, the women's parts were not being taken as in Shakespeare's time by boys with unbroken voices but by young men. Clifford Williams was aware of the unorthodox theories expressed by Kott in his *The Bitter Arcadia*. Kott observing the almost identical appearance of modern youths and girls was reminded of those Shakespearean comedies where the girl appears disguised as a youth. He argues that their theme is that of the sonnets—"the impossibility of choice between the youth and the woman, the fragile boundary between friendship and love . . . the universality of desire which cannot be contained or limited to one sex."

The sober fact remains that Shakespeare is not our contemporary. It is true that historical accuracy of presentation is comparatively recent and that the text can withstand and even be illuminated by anachronism as in Brook's production of *A Midsummer Night's Dream* with techniques borrowed from Persia. The plays can for practical purposes even be abbreviated as in most productions of *Hamlet*.

But violations such as Nahum Tate's notorious happy ending to *King Lear* and Victorian bowdlerism now appear ridiculous. Jonathan Miller, justifying his recent productions has said in interview, "The idea of being faithful to the text is lunatic naïvety" but idiosyncratic production, however unusual and arresting, can quickly appear gimmicky. Helen Gardner castigates as "outrageous arrogance" attempts to present Shakespeare as "our contemporary," an existentialist confounding "the tragic" with "the meaningless," and sacrificing poetry to spectacle and violence.

Recent perspectives.

Meanwhile there have since 1965 been diverse influences from abroad through plays by Soyinka, Duras, Jarry, Mrozek, Fugard, Feiffer, Lowell, Triana and Chayavsky. A new generation of British dramatists has become prominent including Mercer, Bond, McGrath, Storey, Terson, Nichols, Wood, Hampton and Stoppard. Some have experimented in fresh dramatic genres and techniques but generally speaking the most novel contribution of native authors and producers has been a new candour in the presentation of social problems.

Joe Orton, whose best play had been produced in 1964, popularised a peculiar brand of "black comedy" (*q.v.*).

A more serious innovation was the "theatre of fact." *The Investigation* of Peter Weiss set an example for plays which constitute a kind of "documentary" of the stage, the dramatist endeavouring to present objectively a selection and concentration of the actual events of contemporary history. But however detached, the author must by the very act of selection betray a certain bias, as indeed must the professional historian himself.

One of the most sober of such factual plays, Kipphardt's on Oppenheimer, followed Weiss in presenting a judicial enquiry, a trial scene being ripe with conflict, suspense and surprise. Hastings' *Lee Harvey Oswald* took the same pattern. Both were shown in 1966 during a season at Hampstead, the director, Roose-Evans, stressing its preoccupation with ethical problems demanding the live concern of the audience.

The R.S.C. has also carried out an experiment in a new genre, that of "Director's Theatre," and the involvement of the audience was certainly the purpose of *US*, directed by Peter Brook as a direct assault on our apathy concerning the war in Vietnam.

A refreshing candour in the approach to social

problems has been evident in plays involving biting criticism of the military mentality and recourse to war, notably McGrath's *Bofors Gun*, Vian's *The Generals' Tea Party*, and Charles Wood's *Dingo* and *" H."*

Meanwhile the pressing international problem of relations between black and white has been illuminated in plays by Fugard, Saunders, Robert Lowell and the Negro Le Roi Jones.

Illness both physical and mental is now frankly presented. Peter Nichols in 1967 used remarkable theatrical skill in revealing the effects on the parents of the incurable illness of a spastic child. His ironic *The National Health* (1969) was set in a grim hospital ward.

It is no longer unusual to see a play depicting the distressed mind. Storey's first play had as protagonist a young husband struggling through a nervous breakdown, and his touching work *Home* (1970) is set in the grounds of a mental hospital. Both he and Mercer have been concerned with the malaise of a generation educated beyond the parents, and playwrights as dissimilar as Mortimer and Triana have presented the disturbed personality.

There has steadily developed a sympathetic attitude towards sexual deviation. In 1965 *A Patriot for Me*, Osborne's uncompromising record of a homosexual, could be performed only privately, while Frank Marcus' *The Killing of Sister George* indicated a lesbian relationship only under cover of some obvious comic satire of B.B.C. serials and their credulous public. But by 1966 Charles Dyer's *The Staircase*, although serio-comic in tone, could give a direct and uncluttered picture of a homosexual partnership, and in 1968 Christopher Hampton's *Total Eclipse* was completely devoted to a sober, searching, and candid exploration of the historic relationship between Verlaine and Rimbaud.

The abolition in September 1968 of the Lord Chamberlain's powers of theatre censorship removed official taboos on the dramatist's freedom of expression, which will in future be conditioned by the public's response. There has been an increasing vogue for " permissiveness," in the use of four-letter words and in sexual reference. The revue *Oh! Calcutta!* (1970), sponsored by Tynan, included a representation of sexual intercourse and total nudity. The taboo on stage nakedness was broken. Although nudity has proved commercially successful the plays in which it is employed have been unremarkable dramatically.

Four-letter words are now a commonplace. Chaucer used them precisely and effectively and after Victorian repression they probably needed a good airing. In realistic plays such as Whitehead's they give a valid impression of the actual speech of some ignorant folk. Pinter is very conscious of the explosive force of an erotic taboo word suddenly erupting to the surface and for that very reason uses it rarely and deliberately. Lesser playwrights have used such words freely so as to shock, when they show diminishing returns, and through careless reiteration degenerate into a modish gutter slang no more meaningful than the eighteenth-century " swounds " and like false money depreciating the vocabulary.

The avant-garde Living Theatre was well represented here in 1969 by Grotowski and by Julian Beck's dedicated and disciplined company which presented *Paradise Now* and their versions of *Frankenstein* and *Antigone*. In this new genre coherent narrative sequence is discarded in favour of a series of " happenings "—disparate theatrical images, involving movement, mime, inarticulate cries, rhythmic sound and music. These are frequently violent, sometimes in a talented company surprising and beautiful, but often unintelligible. Living Theatre is often imbued with the spirit of Artaud's " Theatre of Cruelty," stressing intense suffering to convey an anarchic message. Sometimes " audience participation " is invited, actors and spectators mingling with each other both on stage and in the auditorium.

Recently much experimental work has made its appearance on the Fringe. An increasing number of enterprising companies—such as McGrath's 7.84, and little theatres working on very narrow margins financially, sometimes on club subscriptions, have presented plays in shabby makeshift quarters such as basements, disused rooms and pubs. Some were founded some time ago, such as the Unity, N.W.1, 1937, or the Traverse Theatre, Edinburgh 1963, which in 1972 presented seven main productions including three premières by the resident company. Recently there have been two successful pub theatres, the King's Head, Islington, and the Bush, W.12, which staged the première of Arden's *The Ballygombeen Bequest*. A fortunate few have good modern buildings such as the Cockpit, 1970, and the Soho Poly, the Half Moon of 1972, all in London.

Normally the more successful fringe plays go on to a wider audience in a repertory theatre or in the West End and it was disquieting that in 1972 although two-thirds of the premières were seen on the fringe none went on to a main theatre, possibly because of the increasing expense in production. But, as in Shakespeare's day, itinerant actors are going out to people who might otherwise lack opportunity.

Criteria of Judgment.

How can the value of novel and experimental plays be estimated? The ultimate test of time is obviously impossible and some of the critical principles by which traditional drama has been interpreted are no longer relevant to the revolutionary plays of Brecht and Ionesco.

The first canon of criticism is to remember that every art form determines the criteria by which it is judged, and the good dramatic critic does not approach any play with a pontifical set of rules but endeavours to keep an open mind, and so to discover its unique significance and value.

Since artistic form is an expression of human feeling, the first encounter with a work of art should be in a mood of extreme receptivity, so that by shedding preconceived notions, the recipient may be aware of the feeling implicit in the work, however novel or even bizarre the expression may be. The initial reaction to drama should be intuitive.

The nature and quality of the implicit feeling can then be considered. Is it an original and genuine response to experience, or perfunctory and stereotyped, is it intense or diffuse, profound or shallow, subtle or commonplace, reasoned or irrational?

Questioning its inherent feeling often reveals that a commercially successful piece, although " well-made," is valueless, while an unconventional work, like Pinter's *Dumb Waiter*, explores and reveals deep-seated anxieties and fears.

Drama is an especially complicated art, in that part of its material being words, it may also involve discussion of ideas. This discussion, however, should not be mistaken for a statement of the author's convictions. In a good play it is an expression of his characters' *feeling* about ideas, a very different thing.

Another enquiry concerns the appropriateness and beauty of the form in which the feeling is conveyed. Many consider that Beckett's *Waiting for Godot*, while lacking the tragic greatness of *King Lear*, conveys its implicit mood, and that each play is an image of man, disillusioned, adrift, assailed by despair in an alien universe. This recognised, the critic's task is to explore the form of the two plays. Apart from the fact that they both use a most improbable fable, they could hardly be more different. *King Lear* is a Renaissance verse tragedy of the fall of princes, with subtle presentation of character development and contrast, and with a coherent plot skilfully developed through arresting action up to the tragic climax. *Waiting for Godot* is a prose play about an abortive encounter, almost devoid of individual characterisation and story, with a static, circular structure and an ending as ambiguous and inconclusive as its beginning. Yet in

either case the form of the play has artistic significance and appropriateness and repays analysis, and here again the critic needs to be a flexible interpreter of the artist's purpose.

The most searching question to be asked of a play is whether it is life-enhancing, whether, like the finest art, it gives delight or deepens understanding.

Most difficult to estimate are those plays like *Lear* or *Godot*, which express a mood of despair. But if man's honesty and endurance are ultimately affirmed, the play is not negative in import. Lear begs forgiveness and the tramps still wait. Similarly a biting satire may be positive if it helps to clear away old wood to make room for new growth. A facile optimism may be a betrayal.

Ideally the best way to know a play is first to see it on the stage, when its theatrical qualities can be enjoyed, and later to read it at leisure, when its literary value can be appreciated.

II. EMINENT THEATRICAL GROUPS

We are greatly indebted to a few enterprising and devoted groups—chiefly repertory companies and theatre clubs—which help to keep drama alive.

Foremost are the Royal Shakespeare Company and the National Theatre, which have earned an international reputation by their superb productions of both classics and new plays. Some groups, such as the English Stage Company and the Traverse Theatre, Edinburgh, have been particularly concerned in introducing new dramatists.

Many repertory theatres are doing exciting work and a comprehensive list of these can be found in the *Stage Year Book*.

Among commercial promoters H. M. Tennent can be relied on for the high quality of their revivals of period plays.

The Royal Shakespeare Company.

When Peter Hall was appointed managing director in January 1960 his enterprising work revolutionised the R.S.C. He decided to supplement the annual season of Shakespeare at Stratford-on-Avon by a continuous repertory of classical and contemporary plays at the Aldwych, and in 1962 a special experimental season was also held at the Arts Theatre.

Under the directors, Peter Hall, Peter Brook, and Paul Scofield, a brilliant team of over 100 actors was gathered together and the imaginative direction and artistic perfection of the ensemble playing became world famous.

In the spring of 1968 there was a rearrangement among the artists and executives at the head of the R.S.C. Peter Hall gave up his post as managing director to become director with special responsibilities for R.S.C. films and for the design and building of the Company's new London theatre in the Barbican.

Each year at the Aldwych original Shakespearean productions from Stratford alternate with other classics and stimulating modern work. Between 1960 and 1965 there were productions of highly experimental plays by Beckett, Livings, Pinter, Saunders, and Whiting and by foreign writers such as Arrabal, Brecht, Dürrenmatt, Hochhuth, Tardieu, Vitrac, and Weiss.

The years 1966–7 saw new plays by Duras, Mrozek, Dürrenmatt, Triana, Feiffer, Mercer, and Dyer, and Peter Brook's much discussed *US*, as well as revivals of Gogol and Ibsen. A special American season was launched in the period 1968–9, with British premières from Albee, Chayavsky, Feiffer, and Kopit.

During the 1969–70 season there were premières of plays by Pinter, Albee, Mercer, and Günter Grass, as well as many most original interpretations of Shakespeare and a six weeks' festival in 1970 at the Roundhouse.

The 1971 season was particularly successful with revivals of both contemporary plays and classics, including an Etherege, and premières of plays by Gorky and Pinter, while The Cut was taken over for three small-scale productions.

One of the most notable recent productions was Arden's *Island of the Mighty* in the winter of 1972–3.

The annual World Theatre Season, organised between 1964 and '73 by Peter Daubney gave a unique opportunity for seeing ensembles from other countries, special apparatus for simultaneous translation having been installed.

An excellent innovation has been the mobile "Theatregoround" for young people which since 1966 has worked in collaboration with educational and municipal authorities.

A thriving R.S.C. Theatre Club produces a quarterly magazine, *Flourish*.

The National Theatre.

Sixty years after Granville Barker and William Archer had formulated plans for a National Theatre, the inaugural production of *Hamlet* took place on 22 October 1963 at its temporary home, the Old Vic.

Laurence Olivier already appointed director, the nucleus of a distinguished company was formed and soon established its high reputation for exquisite ensemble playing, guest artists also appearing on occasion.

The intention was to build up a large repertoire of classical and modern plays from all countries and the wide and varied list includes works by Euripides, Shakespeare, Ben Jonson, Webster, Congreve, Farquhar, Molière, Feydeau, Pinero, O'Neill, Strindberg, Shaw, O'Casey and Brecht. Contemporary dramatists represented are Arden, Arrabal, de Filippo, Griffiths, Miller, Nichols, Peter Shaffer, Stoppard and Wood.

The imaginative quality of production and acting has been enthusiastically acclaimed by packed houses and the scenery has often been breathtaking, especially in the designs of the Czech, Svoboda, for Ostrovsky's *The Storm* and Chekhov's *The Three Sisters*.

Gielgud made his welcome début at The National in *Tartuffe* and Seneca's *Oedipus*. Clifford's fascinating production of *As You Like It* with an all-male cast appeared.

A most attractive booklet is issued for each production and is available to the audience at a trifling cost. This supplies authoritative information about the author, the play, its sources and inner references, notable productions and critical estimates, together with photographs, reproductions, and plans.

A recent welcome development was an experimental workshop season in the spring of 1969 when three different productions were staged during three weeks at the Jeannetta Cochrane Theatre, and in 1971 there was a season at the New Theatre.

A new company, The Young Vic, was formed in 1970, with its own auditorium in The Cut. It caters for the under-25s and has already offered some lively productions and a wide choice of playwrights, including Shakespeare, Beckett and Molière.

In April 1973 Peter Hall became co-director with Olivier and in the autumn assumed full responsibility.

The English Stage Company.

Since 1956 the English Stage Company at the Royal Court has been tireless in its discovery and support of new talent. Formed to promote contemporary drama, the company acquired in 1956 a long lease of the Royal Court with George Devine (d. 1965) as director and Tony Richardson as assistant. Declaring themselves a Writers' Theatre, they were extraordinarily successful in discovering and sponsoring playwrights hitherto unknown, such as Osborne, N. F. Simpson, Ann Jellicoe, and John Arden, and in persuading the novelist Nigel Dennis to write for the stage.

An offshoot of the Company, the English Stage

Society, initiated in May 1957 the inexpensive Sunday night "Productions without Decor," which brought to light such successes as Wesker's *The Kitchen* and Owen's *Progress to the Park*.

Writers beginning to make their reputation elsewhere were welcomed. Beckett's *Endgame*, *Krapp's Last Tape*, and *Not I* had their première here. Many distinguished foreign plays were seen in Britain for the first time at the Court, including Arthur Miller's *The Crucible*, Tennessee Williams' *Orpheus Descending*, Ionesco's *The Chairs* and *Rhinoceros*, Sartre's *Nebrassov* and *Altona*, Genet's *The Blacks*, and Brecht's *The Good Person of Szechwan*, the first Brecht ever staged in London.

In October 1965 William Gaskill, who has now resigned, succeeded Devine and the autumn season 1965 saw new plays, by Jellicoe, Simpson, and Bond. There have since been revivals of both classic and modern works and several British premières of unusual plays, including Wesker's *Golden City*, Orton's *Crimes of Passion*, Charles Wood's *Dingo*, and the Nigerian Wole Soyinka's *The Lion and the Jewel*. A most interesting departure has been to stage here plays from the past hitherto ignored such as Jarry's seminal French play of 1896, *Ubu Roi*, the Russian Babel's *Marya* of 1933, and Wedekind's *Lulu*. The establishment of D. H. Lawrence as a dramatist, culminating in the special Lawrence season of 1968, was an event in theatrical history.

Similar seasons followed of three plays each by Osborne (1968), Bond (1969) and Storey (1969–70).

Lindsay Anderson and Anthony Page became co-directors with Gaskill and the year 1970 was exceptionally fruitful, with excellent revivals of the classics and five premières of plays (by Howarth, Hampton, Wedekind and two by Storey), transferring to the West End. Theatre Upstairs, opened in 1969, still encourages the latest and most promising experimental work, and in 1971 launched the new dramatist, E. A. Whitehead (*q.v.*).

In 1973 the Court scored a notable success in two productions which in the judgment of the London critics tied for first place as the "best play of the year", *Savages* by Hampton and at The Theatre Upstairs *Sizwe Bansi is Dead*, a most unusual piece by Fugard and his two black South African collaborators, Kani and Ntshona. Other premières were Beckett's *Not I*, Brenton's *Magnificence*, Storey's *The Farm* and *Cromwell* and Bond's *The Sea*. In late December there opened a season of three South African plays in all of which Fugard had a hand.

The Mermaid Theatre.

It was largely due to the efforts of Bernard Miles that in 1959 the City of London's first new theatre since Shakespeare's time was opened at Blackfriars. Commerce, industry, and the general public had generously given money, the City Corporation had granted the site at a peppercorn rent and the four-foot-thick surviving walls of a blitzed warehouse had been used as the shell for a delightful little theatre of 499 seats.

It has an open stage, based on that of Shakespeare's day, while an excellently raked auditorium, all on one tier, like a segment of a Greek amphitheatre, ensures perfect sight lines. The most modern lighting, revolving stage, and sound and film equipment are installed.

The Mermaid is now part of the City's artistic life with foyer exhibitions, films, concerts, and lectures. The enterprising "Molecule Club" for children uses ingenious theatrical means to demonstrate basic scientific principles.

The Mermaid has a fine, varied record of productions, including British premières of works by Brecht, Camus, and O'Casey. There have been revivals of Shakespeare, Ford, Dekker, Beaumont and Fletcher and Shaw, and of foreign plays by Ibsen, Pirandello, Henry James, and Lessing.

The year 1967 was notable for an imaginatively planned cycle of four dramas by Euripides concerning the Trojan War, and by the English première of the fine verse play *Benito Cereno* (*q.v.*) by the distinguished poet, Robert Lowell. 1970 was marked by Pinter's moving production of James Joyce's long neglected *Exiles* (*q.v.*).

The National Youth Theatre.

Originating in Alleyn's School and the enterprise of Michael Croft, the N.Y.T. fosters in young people an appreciation of theatre, whether as audience or performers. Since 1959 it has performed annually in the West End, and in its foreign tours has presented plays at the festivals in Paris and Berlin. In 1971 an enlightened Camden Council generously offered the National Youth Theatre fine permanent headquarters—the new Shaw Theatre, which will also be used by an offshoot of the National Youth Theatre, the professional Dolphin Group.

The National Youth Theatre has been remarkably fortunate for since 1967 Terson (*q.v.*) has written for it plays specially commissioned, admirably suited to the company and enthusiastically received.

Several young amateur actors have become professional, including Derek Jacobi and John Stride.

Theatre Workshop and Joan Littlewood.

Between 1953 and 1961 Joan Littlewood as director of Theatre Workshop at Stratford East introduced several new playwrights, including Behan and Delaney. Spontaneity, pseudo-Brechtian techniques and social commitment rather than careful construction were the hallmarks of her work, her masterpiece being *Oh What a Lovely War* (M). This paradoxically used a period piece brilliantly to satirise the tragic futility of the first world war.

In 1967 Littlewood directed *MacBird* and *Mrs. Wilson's Diary*.

MacBird (P), by Barbara Garson, is an American parody on *Macbeth* in doggerel blank verse. Described by Brustein as "brutally provocative" and "grimly amusing," it attacks the American "Establishment," under Lyndon Johnson. Unfortunately Joan Littlewood made such alterations to the text that the satirical parallel with Shakespeare was blurred.

Mrs. Wilson's Diary (M), in form a jolly pre-war musical, was described by its authors, Ingrams and Wells, as "an affectionate lampoon" on the Wilson administration.

In 1970 Joan Littlewood returned to Stratford East, where she has produced Hill's *Forward Up Your End* and Wells' *The Projector*, set in Walpole's age but suggesting parallels with the collapse of flats at Ronan Point.

III. GLOSSARY OF DRAMATIC TERMS

Absurd Drama.

The Theatre of the Absurd, originating in Paris, was introduced here through the plays of Beckett and translations of Ionesco, Vian, and Vitrac. It has had considerable impact on Pinter, N. F. Simpson, Saunders, and Stoppard, while American absurdist plays by Albee, Gelber, and Kopit and by the Swiss Frisch, have also been produced here.

The concept of the Absurd was first formulated by Camus to indicate the discrepancy between human reason and aspiration and an indifferent and hostile universe. But like Sartre he expressed his convictions through the traditional dramatic form.

Not every playwright of the Absurd is an existentialist and many are more concerned with an irrational human society than with the universe. What they have in common is a technique. All have discarded traditional realism and express

absurdity through images that are themselves absurd, including bizarre situations and objects, both sad and comic, such as aged parents consigned to dustbins.

There is in the Absurd an element of Surrealism and Dr. Bradbrook has suggested that a better term might be Theatre of Dream, for it is the unconscious dream mind that juxtaposes objects and incidents that in the waking state have no connection, such as a rhinoceros in a provincial street. Pinter seems to have an intuitive awareness of the hinterland of dream, while Simpson makes a conscious manipulation of Surrealism.

Frisch has ably demonstrated that the Absurd can be an effective vehicle for satire and many absurdist writers, such as Ionesco and Simpson, have satirised the modern prostitution of language corrupted by salesmen and politicians, and have used conversation of vapid emptiness to reveal its breakdown as a means of communication.

It is partly because of their distrust of language that they have had recourse to ludicrous objects and images, thus extending the range of total theatre.

The Aristotelian Play.

Brecht and Ionesco have disparagingly referred, somewhat inaccurately, to "Aristotelianism." Strictly speaking, this means the concept of tragedy which Aristotle first analysed in his *Poetics*, basing it primarily on the poetic tragedies of Sophocles, especially the *Oedipus Rex* (P), c. 425 B.C. The Aristotelian concept, revived since the Renaissance, has obviously been much modified, but certain basic principles can still be discerned.

Aristotle claims that poetry in general aims at that rational pleasure which is part of the good life. He defines tragedy as the imitation of an action. By imitation he does not mean the description of an actual happening but of one that is possible. Hence the poetic licence whereby the dramatist may adapt historical material to his own theme.

Aristotle stresses that the action should be complete in itself and have inner coherence. Tragedy must have an intelligible beginning, a middle necessitated by the beginning and which itself necessitates the end. "The story . . . must represent one action, a complete whole, with its several incidents so closely connected that the transposal or withdrawal of any one will disjoint and dislocate the whole."

The action should be of some magnitude, with "incidents arousing pity and fear wherewith to accomplish the purgation of such emotions." Here is Aristotle's celebrated doctrine of purgation or "catharsis" which has been variously interpreted, some considering that something like a ceremonial purification is intended, with an ethical end in view, others that bodily or psychological relief from tension is meant.

Aristotle emphasised the paramount importance of action or plot, the characters being revealed in and through the action. The kind of plot recommended is one where the hero is an eminent man, neither inordinately good nor bad, whose misfortune is brought upon him by some error of judgment.

Here is the germ of the splendid Renaissance tragedy concerned with the fall of princes and also of the modern finely constructed play, such as Ibsen's *Ghosts*. Such a play has classical symmetry, the beginning, middle, and end, becoming in modern parlance the exposition, development, and climax or dénouement. It has its own organic unity and inevitability. But although many writers, such as Sartre, still work within the classical disciplines many have discarded the traditional form.

Brecht and his followers have repudiated the whole pattern in favour of a sequence of self-contained episodes strung along a narrative thread, where ironic detachment supersedes the emotional involvement and catharsis of Greek tragedy.

In this day of the common man few are concerned with the fall of princes, and it is interesting to examine some of the more striking modern plays and to ask how far they stand up to the Aristotelian canon. Should a new concept of tragedy be evolved, that of potentiality unrealised, not a fall from greatness but a failure to rise?

Black Comedy.

Orton (*q.v.*) popularised a genre in which human suffering is presented as comic. The basic technique is the shock of violent juxtapositions both in language and incident. Death, mental illness, murder, sexual perversion, suddenly excite laughter because they are conveyed in deadpan jests and genteel terms, or are promptly succeeded by the bathos of farce. Like circus clowning, the style has some value, especially in satire, but it easily stifles compassion.

The Brechtian or Epic Play.

Many British dramatists have felt the pervasive influence of the Bavarian Brecht (*q.v.*), who developed a new kind of Epic or narrative play of debate, with a loose sequence of episodic scenes linked by commentary or songs. Discarding realism, Brecht attempted not to arouse the onlooker's emotions but to stimulate him to think about social issues and to take left-wing action. In the event his ambiguous central situation appealed to deeper levels of experience.

There have been several instances of the ambiguous protagonist, but English playwrights have tended to adopt not the political intentions but the style of the Epic genre. Esslin has said that Shaffer in *The Royal Hunt of the Sun* has joined "Bolt, Arden and John Whiting of *The Devils* in the select group of British dramatists who have genuinely benefited from the conception of epic . . . techniques in drama."

Theatre of Cruelty.

In 1938 Antonin Artaud published *The Theatre and its Double*, a collection of essays and letters, which forms the theoretic basis of the Theatre of Cruelty, his central purpose being a ritual of cruelty to exorcise fantasies.

Professor Brustein has described how Artaud hated industrial civilisation, believing, like Freud and D. H. Lawrence, that it stifled instinctual life. He claimed that the theatre, as the heart of a common culture, should enact a primitive ritual of cruelty, a sacrificial frenzy and exaltation. In this way it would bring to the surface and exorcise the spectator's latent anarchy, violence, and eroticism, serving as an "outlet for repressions."

Artaud's theories have yet to be proved. Anthropology has shown that a sacrificial blood ritual was long practised by primitive tribes without diminishing man's urge to cruelty, as is poetically conveyed in Edith Sitwell's *Gold Coast Customs* (*see* **M, Part III**). A modern dramatic enactment can certainly make us aware of repressed violent impulses but does it clear them away?

As to technique, Artaud envisaged a total theatre appealing to total man, primarily visual, where the all-important director would deploy "music, dance, plastic art, pantomime, mimicry, gesticulation, intonation, architecture, scenery and lighting" to induce a state of trance. Attacking the inadequacy of a pallid conceptual language, Artaud demanded that dramatic language should have an emotional and incantatory effect.

Genet fulfils Artaud's demands and in England the specific Theatre of Cruelty has been best represented by his plays, the *Marat-Sade* of Weiss and Triana's *The Criminals*. Its influence can be seen also in *The Architect and the Emperor of Assyria* of Arrabal. But the methods of production advocated by Artaud have had a wide and pervasive influence on the movement towards total theatre.

Expressionism.

The genre flourished in Germany after the first world war, where its chief exponents were Kaiser and Toller, and in Czechoslovakia in the plays of Capek. O'Neill and O'Casey have also occasionally experimented with Expressionism.

Reacting from Realism with its insistence on individual psychology and the detailed representation of actual life, Kaiser, Toller, and Capek deliberately rejected the particular in favour of the typical. Living at a time of social upheaval they were preoccupied with the class struggle and with man's fear of the encroaching machine. Their subject was social flux and clash and they

sought to project on to the stage the aspirations and fears of large social groups or of the generality of mankind.

Their characters are types, sometimes even symbolic figures such as the Nameless one representing the mob in Toller's *Man and the Masses*. Their décor is stylised with occasional use of film, the dialogue staccato and the brief scenes are characterised by mass movement and swift action.

Allardyce Nicoll carefully distinguishes between the aims and the methods of Expressionism. He considers that although some impressionistic plays of Strindberg and later subjective writers sometimes employ similar techniques they cannot justly be considered as expressionist because their aim is to reveal subjective feelings.

Wesker's *Golden City* and Wood's *Dingo* employ Expressionism but in England generally it is the techniques rather than the aims of the genre that have been adopted.

Naturalism.

Naturalism in drama may be regarded as a special case of Realism, and it is not easy, nor perhaps always desirable, to make a sharp distinction between the two.

Naturalistic drama attempts to record as faithfully as possible the actual experiences of life, however banal, and to present life, undistorted by the playwright's theories or too much concern for artistic form. The virtues of Naturalism are fidelity and spontaneity. Its danger is that it may keep so close to life as to lose artistic form and tension, becoming the stage version of the tape recorder. *See* Slice-of-Life Play.

It was Zola in the 1870s who propounded the principles of Naturalism. Distrusting both the play of ideas and the well-constructed play as tending to impose on life a falsifying and artificial pattern, he urged that drama should record as objectively as possible the actual course of man's life, especially the way it is conditioned by environment.

Strindberg's *Miss Julie*, 1888, is an essay in Naturalism but the genre is found in its most accomplished form in the Russian theatre, especially in Stanislavsky's production at the Moscow Art Theatre of the plays of Chekhov and in 1902 of Gorky's *The Lower Depths*.

Neo-Realism.

There is nothing new in dramatic Realism (*q.v.*) as such. What is novel is the realistic presentation of the shabby lodgings and streets of the underprivileged. Gorky in *The Lower Depths* was perhaps the first dramatist to reveal the wretched condition of the destitute and this play influenced O'Neill's *The Iceman Cometh*. Their production in London, with a starkly realistic background, had some effect on those modern plays where the kitchen-sink and dustbin were as much in vogue as was formerly the fashionable drawing-room.

Any worth-while play has significance far beyond its milieu and modern neo-realistic plays vary greatly in theme and purpose. Wesker, Delaney, Livings, Owen, Osborne, Orton, Bond, Lawler, and Seymour have all used the style in differing ways.

Several of these playwrights have themselves been workers and their plays are an authentic interpretation of their own culture, once inaccessible to the middle-class audience. The fact that their work is occasionally loose in structure may be attributable to the influence of Naturalism (*q.v.*) or to the author's unacademic background. The advent of this fresh and vigorous drama from a group that has seldom been articulate has been one of the most encouraging aspects of modern theatre.

Realism.

Writers of realistic drama, such as Galsworthy, attempt to create a stage illusion of actual life, usually through the medium of the well-constructed play. It is not always easy to distinguish between Realism and Naturalism—its extreme form—but one salient difference is that the latter tends to discard organised plot as imposing a false pattern on the flux of life.

Bolt, Cooper, Mortimer, Shaffer, and Porter have all written realistic plays, and since the 'fifties there has been a succession of competently constructed realistic plays associated with the novelists, Graham Greene, C. P. Snow, and Muriel Spark.

The Satirical Play.

Recent years have seen heartening revivals of plays by Shaw, triggered off by Stage Sixty's production of *Widowers' Houses*, with its topical relevance to Rachmanism. There followed a long succession of Shaw revivals.

Shaw has found few successors, for genuine satire is a most demanding art. Subjective hostility and negative criticism are not enough. The motive power in Ibsen and Shaw was rational indignation, a most difficult fusion of strong emotion and objective reasoning, and their satire was constructive in that it implied and indicated positive values. It was also characterised by a precise aim at a specific target. Vague and wholesale denunciation diffuse a disagreeable tone which has a boomerang effect for it becomes associated not with the targets but with the playwright himself.

The graces of satire are detachment, irony, and wit and it flourishes apparently in a stable society such as that of the 18th century, which produced Swift and Voltaire. The European upheavals of the last half century have been unpropitious for satire and it is significant that the best plays in this genre, those of Frisch and Dürrenmatt, have come from neutral Switzerland.

The English playwright nearest to Shaw is Nigel Dennis, and Giles Cooper shared his ironic detachment.

The "Slice of Life" Play.

Here is an extreme kind of Naturalism, where the author has been so anxious to preserve fidelity to the natural spontaneity of living, that he has all but discarded form, as having a cramping and distorting effect.

One of the most typical examples is Henry Chapman's *You Won't Always Be On Top*, showing the disconnected minor incident and talk of men ostensibly "at work" on a building site. Shelagh Delaney's *The Lion in Love* is also in this vein.

Verse Drama.

During the 20th century several attempts have been made to revive drama in verse—the normal vehicle for the Renaissance playwright. Although the verse plays of Shakespeare and his contemporaries, kept alive in excellent revivals, still rise like the Himalayas above the contemporary scene, the dramatist today who tries to use verse has not the benefit of an unbroken tradition. Yeats, T. S. Eliot, and Christopher Fry all succeeded for a time in getting their verse plays on to the stage but at the moment the most successful poetic drama achieves its effect through poetic prose and the theatrical poetry of its situation and stage imagery. Dylan Thomas' *Under Milk Wood* successfully used these media. For many contemporary audiences it is Beckett, Arden, and Pinter who have captured the poetry inherent in drama.

The finest verse play seen on the English stage for many years is Robert Lowell's *Benito Cereno*.

The Well-made Play.

The term "well-made play" is most frequently used in a derogatory sense. Eric Bentley has pointed out that the "well-made play" is a form of classical tragedy, degenerate in that although the plot is ingeniously contrived, with arresting situation, intrigue, and suspense, the play is mechanical and devoid of feeling. The television series, *The World of Wooster*, is an example.

The expression was frequently used disparagingly of the French plays of Scribe and of Sardou, ridiculed by Shaw for his "Sardoodledum."

IV. INDIVIDUAL DRAMATISTS

This part, alphabetical in arrangement, includes dramatists whose work, whether English or in translation, has had its British première since 1950. Unless otherwise stated the quotation of date and actor refers to the British première.

Inexpensive paperback editions are referred to thus: F: Faber and Faber. M: Methuen. P: Penguin. Inexpensive acting editions can usually be obtained from French's Theatre Bookshop, 26 Southampton Street, W.C.2.

Arthur Adamov (b. 1908).

Adamov first wrote plays such as *Professor Taranne* (P), which translate his own personal neuroses into images of the absurd, until with the propagandist *Paolo Paoli* he adopted a Brechtian technique. His *Spring 1871*, an epic panorama of the Paris Commune, had its world première in London in 1962.

Edward Albee (b. 1928).

The American Albee is a brilliant satirist, master of a hostile dialogue of barbed intellectual wit, and an adept in utilising diverse styles. He was adopted by wealthy foster parents and his major plays express the claustrophobia, the introverted emotional involvements, the terrible emptiness that may lurk behind the deceptively secure façade of wealth.

His early plays include the absurdist *Zoo Story* (P) and *The American Dream* (P), and the realistic *The Death of Bessie Smith*.

Who's Afraid of Virginia Woolf? 1964. P.

A brilliant and scarifying satire on sterility in an American campus uses a ritual movement. George and Martha, named after the Washingtons, are an unsuccessful and childless middle-aged couple. They cherish a fantasy "son," whom George, to spite Martha, symbolically "murders" during a liquor-ridden night party, when they attack each other and their guests (a young couple also childless) with ferocious mental cruelty.

A Delicate Balance. 1969. P.

An icy surface glasses over treacherous depths in the well-to-do home of Tobias (Hordern) and Agnes (Peggy Ashcroft) and the play begins and ends with her virtual monologue—phrased with the elegance of a Henry James—on how it will be if she goes mad.

Agnes holds the "delicate balance" of polite manners, while tolerant Tobias is now ineffectual and her alcoholic sister Claire persists in her sarcastic utterance of unwelcome truths. The most galling, obliquely hinted at, is that Tobias is more drawn to Claire than to Agnes.

Their son long since dead, and Tobias having then withdrawn from Agnes, their sole offspring is the neurotic Julia, who now returns home at the breakdown of her fourth marriage.

Suddenly their "oldest friends," Harry and Edna, arrive seeking asylum from some inexplicable terror of "nothing." Bewildered, but courteous, the hosts accept their guests, but after Julia has threatened to shoot the "intruders," Agnes forces Tobias to realise that they bring "the plague."

Tobias, unable to discard his last ideal of friendship, begs them to stay, while telling them this truth, but they depart, realising that they demand a sacrifice they themselves could not make.

Here is a microcosm of a society where love and friendship have died, humanism crumbles, and little but polite diplomacy survives, often a vehicle for fear and hostility. In tone it is a bitter inversion of the Apocryphal *Tobit*, with its touching pictures of religious faith, family love and neighbourliness, and the "entertaining of Angels unawares."

The literary provenance in subject and style is Eliot's *Family Reunion*, where another Harry, fleeing the furies, comes to a Wishwood, also dominated by a woman whose husband had loved her sister, like Claire also a visionary. But in Eliot the visionary is healer not destroyer, and Harry departs to "follow the bright angels."

With literary subtlety Albee exposes the "panic and emptiness" in a society losing its confidence and sense of values.

Tiny Alice. 1970.

A "metaphysical melodrama," of great emotional tension, possibly personal, is at surface level, like Dürrenmatt's *The Visit* (*q.v.*), a satire on materialism, with the victim sold to Mammon. It has another facet, the schema being primitive magic, the sexual initiation and ritual sacrifice of the victim. Here Albee draws on techniques of the Theatre of Cruelty (*q.v.*). There are also echoes of T. S. Eliot's *The Cocktail Party* (*q.v.*) and of Lewis Carroll's *Alice*.

A brilliant first scene initiates a bargain between two astute and unsavoury men, literally "of the same school," who detest each other—the Cardinal, corrupt representative of the Church, and the Lawyer, emissary of Miss Alice, embodiment of Croesus. She is to confer immense wealth on the Church on condition that the lay brother Julian shall collect it.

With Julian, the gentle and compassionate protagonist, a deeper theme is developed, the distinction between actuality and symbol. His ideals being service, obedience and possible martyrdom, Julian has fought unremittingly against accepting illusion and a false god, the puppet made in man's image, instead of God the Creator.

But in Miss Alice's echoing castle he is confronted and confused by an extraordinary image, a huge model, an exact replica of the castle, and within it a tiny model of the model. Sometimes events within castle and model synchronise.

The play's sinister dimension now becomes clearer, as Miss Alice, her brutal lover, the lawyer, and the butler, a former lover, plan, with the acquiescence of the cardinal, to entrap Julian. Their purpose is consummated as Miss Alice by witchery and her appeal "Help me," seduces Julian, when she utters the cry "Alice." (On the satirical plane this may signify that only by orgasm can the millionairess realise her identity).

Later, after Julian's marriage to Alice by the reluctant cardinal, the four participants in the plot circle round Julian drinking to "the ceremony" and "Alice." Julian is now told that Miss Alice is an illusion, a surrogate for the real Alice who is within the model. Refusing to accept this, he is callously shot by the lawyer and left to die alone, slumped against the model.

The disparate elements in this exciting and disturbing play are not perfectly fused. Although Miss Alice experiences conflict between her "awesome" rôle and genuine tenderness for Julian, the characters are, with the exception of the complex Julian, two-dimensional. He, in his shy integrity, is touchingly portrayed. But his problem of faith although clinically scrutinised is not penetrated. This is especially apparent in his ambiguous and over-long dying soliloquy.

The work is meticulously plotted and worded, motifs, gestures, and phrases poetically recurring with ironic and suggestive shifts of meaning.

All Over. 1971.

In the handsome room of a dying celebrity there "gather" his Wife aged seventy-one, his Mistress, a fading voluptuous beauty for whom he had twenty years ago deserted the Wife, his Best Friend with whom the Wife had had a brief affair on her husband's desertion, and his Son and Daughter. In the background the aged Family Doctor and a Nurse attend the death bed. The characters are not named and they are presented in outline only. Their pasts are vague.

The Wife's question, "Is he dead yet?" opens the play and her chilly clinical detachment is reflected in the older generation's dispassionate reminiscences of other deaths sometimes gruesome and violent, anecdotes which alternate with nostalgic memories and shifting rivalries. The Wife's haughty aloofness is a defence against

desperate emotion, but she does not disguise her contempt for her ineffectual Son and unstable Daughter now living with a brutal married man. The only event and climax of Act 1 is the unhappy Daughter's revengeful attempt to let the waiting Pressmen into the room.

Only at the final intimation of death does the Wife's control crumble, as with slow self-discovery she says, "I don't love *anyone*. (Pause) Any more . . . I LOVE MY HUSBAND!! . . . All we've *done* is to think about ourselves. Ultimately." She finally breaks into uncontrollable sobbing with the reiterated cry, "Because I'm unhappy."

This is a hint that the Wife may have realised the significance for herself of her former vindictive taunt to her daughter, "Do you love anyone?" She may realise that the plight of her despised children may not be unconnected with the parents for twice she had said, "We made them."

But characterisation in depth is not the mainspring here, for Albee has attempted to endistance and universalise the situation. There are many references to ritual and echoes of T. S. Eliot's *The Family Reunion* where another matriarch, Amy, deserted by her husband thirty-five years previously, unjustifiably accuses her sister of taking him from her at a ritual family gathering for her Birthday which proves also to be the day of her death. But in *All Over* the power of communal emotion which inspires ritual (here that of the death bed) is lacking. There is little love and no religious awe, and ritual has dwindled to convention.

This is a static play, like the fifteenth-century *Everyman*, a paradigm of the human predicament but enacted now in a "sad and shabby time".

Jean Anouilh (b. 1910).

Anouilh is a playwright of remarkable theatrical versatility and skill. Following Giraudoux, he has frequently employed classical themes, as in *Eurydice* (M), and *Antigone*, 1949 (M), with Olivier and Vivien Leigh. More recently he has treated historical figures, Saint Joan in *The Lark* (M), and Becket in the play of that name (M). The play within a play is a favourite expedient of his and he used it again in *The Fighting Cock* (M), produced at Chichester, 1966.

Anouilh's outlook is deeply pessimistic. A recurring theme is that purity is incompatible with experience of life and many of his protagonists say, "No." His plays fall into two categories—the fatalistic *pièces noires* and the romantic fantasies, *pièces roses*.

They have been extraordinarily popular on the London stage of the 'fifties and Anouilh's amoral attitude has been reflected in many West End successes.

Aleksei Arbuzov (b. 1908).

The Russian producer and playwright Arbuzov has been writing since 1930.

The Promise. 1966.

In the best tradition of naturalism *The Promise* is a moving and positive work free from both illusion and despair.

During the siege of Leningrad three adolescents, two boys and a girl, contrive to survive in a bombed house, and here in brief episodic scenes their hardship, gaiety, and the slow awakening of love are shown with a delicate and touching naturalism.

Four years later Lika must choose between the two men and although she loves the engineer Marat she chooses the dependent, poetic Leonidik. The decision brings fulfilment to no one and finally Leonidik courageously summons back Marat and leaves him and Lika together, a conclusion analogous to that of *The Caucasian Chalk Circle*.

John Arden (b. 1930).

Arden is a vigorous and gifted playwright, who has experimented with a variety of subjects and methods, sometimes too original and complex to find quick acceptance.

He has the rare gift of the poet and his diction is often richly suggestive and evocative. He has said in interview that plays should use speech in the way that a poet uses individual images and that the playwright "should *form* language rather than just report it", so that even colloquial speech is given a tension and dramatic rhythm different from that of ordinary talk.

With the exception of *The Island of the Mighty* Arden's major work has been produced before 1967 and since some more recent plays have differed in approach and key it is appropriate first to discuss his earlier work.

His characters have been full-blooded and rich in human contradictions, and he has sympathetically brought to life even such bogeys as Herod and King John. He has chosen to dwell on some ambiguous personality, where generosity conflicts with violence, and to consider the problems of directing man's unruly vitality.

His favourite theme has been the dispute between instinctual energy and good government and he has pleaded the case cogently for both sides, giving no facile judgment or direct "message", unless it be "the recognition of the fallibility of man". Thus although, like Brecht, he is deeply concerned with social and political issues, he remained politically "uncommitted." He has above all been the dramatist of the dilemma.

There has been a fruitful cross-fertilisation of Arden's interest in current events and his literary studies; and his historical plays, like Brecht's *Mother Courage*, have combined a fine sense of period and a sharp relevance to some current issue.

His plays have been poetic in structure, depending in part on the recurrent image and metaphor and, like Arthur Miller in *The Crucible*, he has skilfully devised for each an appropriate dialect of time and place. At the same time he has a keen sense of theatre, and has successfully adapted techniques from Miracle plays, Elizabethan drama, music-hall, puppet stage, and Brechtian epic play.

Apart from *The Island of the Mighty*, most of Arden's recent plays have been more theatrical in effect. They lack his poetic intensity both in style and structure, despite a more lavish use of verse and song. Lively and original, they are still much concerned with social problems and there is not the same many-angled approach and personalities are often deliberately presented in caricature. Arden continues to deploy novel theatrical techniques with surprising ingenuity.

Live Like Pigs. 1958. P.

Seventeen realistic scenes full of comic and frightening incident reveal how fatal conflicts develop between households at different social levels in a new housing estate. Street ballads in Brechtian style preface some scenes.

The Happy Haven. 1960. P.

Here, in a good-tempered satirical fable, enlivened by a dash of magic, Arden touches on problems of longevity.

Doctor Copperthwaite, the superintendent of the Happy Haven, an old people's home, is, like a mediaeval alchemist, bent on producing an Elixir of Life and Youth, intending to use his five unsuspecting patients as guinea-pigs. But outwitted by them he is himself transformed into a small boy.

The theme is childishness. The egocentric demands of the very old are seen as amusing childish foibles, while Doctor Copperthwaite, so absorbed in his research as to forget ends for means, brings childishness on himself.

In form the play is an extended puppet show. The characters wear masks, the set is formalised, and there is even a dog, Hector, but unlike Dog Toby he is visible only to the dramatis personae.

Serjeant Musgrave's Dance. 1959. M.

For a fine play, which explores the ethical dilemma of war, Arden drew on two sources—contemporary events in Cyprus and a journal written by a deeply devout N.C.O. during the Crimean War. He has fused his material into vivid incidents, which he projects against the background of a fictitious colonial war of the 1880s.

In a frost-bound colliery town there arrive three private soldiers, led by the dominating Serjeant Musgrave. They claim to have come re-

cruiting but are in fact deserters from a colonial war.

In spite of his rigid sense of military duty, Musgrave had been horrified by the terrible five-fold reprisals taken by the British for the assassination of a comrade, Billy Hicks. Believing himself to be God's agent, he has now come to Billy's town, obsessed by one purpose, to expose war's horrors.

Exhibiting Billy's skeleton in the market-place, he at first wins sympathy in his denunciation of atrocities. Then bewildered by his own confused "logic," he demands twenty-five deaths in return for the five taken by the British and turns the gatling on the astonished crowd.

Suddenly, with the thaw, the Dragoons arrive and Musgrave finds himself awaiting execution, stunned that no one has learned the lesson he yearned to teach.

Fierce incident and macabre surprise are used for a play of ideas which enunciates no facile answer. It is typical of Arden's fair and non-doctrinaire approach that the dilemma of the religious man in face of war should be embodied in the fanatical and confused Musgrave. This has sometimes misled the audience, but the spirit of compassion implicit throughout the play is clearly revealed in the gentle, pacific Private Attercliffe, who is also to be executed with Musgrave. The women's parts are also significant, especially that of Mrs. Hitchcock, the owner of the inn, who visits Musgrave in prison and shows him how he had erred in trying to use war itself to end war. In his darkest despair she gives him hope, and it is symbolic that he accepts drink from her hand.

The complex play weaves together many tensions; harsh discord between colliery owner and strikers; contention between the three privates, each of whom is strongly individualised; the discrepancy between a woman's love and the careless soldier's life; Musgrave's own bitter inner struggle.

The dialogue has a wonderful period character and the soldiers' ballads and lyrical songs occur with complete naturalness.

The Workhouse Donkey. 1963. M.

Styled by Arden as a "vulgar melodrama," this ample Brechtian play shows jockeying for power in a northern town between the Tory Alderman Sweetman, a wealthy brewer, and Alderman Butterthwaite (Frank Finlay), the Labour ex-mayor. Both attempt to manipulate the police and to enlist the support of the electorate, represented by the shifty turncoat Doctor Blomax, until all these four elements of the community are deeply corrupted.

Butterthwaite, called "the workhouse donkey" because born in the workhouse, is the dominating Rabelaisian character. A Dionysiac figure, he is drunken, lecherous, and amoral, yet devotedly loyal and generous. Finally in an attempt to help the treacherous Blomax he robs the Borough safe and brings disaster on himself and the town.

The personality of the late Mr. Joseph D'Arcy of Dublin inspired much of the play.

Armstrong's Last Goodnight. 1964. M.

The old "Ballad of Johnie Armstrang," *c.* 1603, forms the framework of a play concerning the dilemmas of government. Armstrong of Gilnockie, the Scots Border laird, freebooter and rebel, is invited to a meeting by the young Scottish King James V and then treacherously hanged. Arden has introduced into this stark story the historical character of the king's herald, Sir David Lindsay, poet and politician, and shows him at first striving by devious diplomatic expedients to persuade Armstrong (Albert Finney) to loyalty, before he finally advises force. The play is diversified by minor characters and incidents which overcomplicate the impressive ballad line.

The introduction of Lindsay was suggested to Arden by his reading of Conor Cruise O'Brien's book *To Katanga and Back*, for he was struck by "a basic similarity of moral" between 20th-century Africa and 16th-century Scotland, the rôle of O'Brien being similar to that which he invents for Lindsay.

Arden makes free use of Elizabethan pageantry and of Brechtian ballad-singing and the setting is the mediaeval convention of "simultaneous mansions," Gilnockie, the Border, and the Court all being formally represented on the stage at one and the same time.

Arden "constructed" a dialect to suggest place and period, but it is difficult to follow.

Left-handed Liberty. 1965. M.

Commissioned by the Corporation of the City of London to write a play to commemorate the 750th anniversary of Magna Carta, Arden presents the historical facts with very little transposition and addition.

He approaches his theme of liberty from an unusual angle, showing the aftermath of Runnymede in the apparent failure of the Charter, and demonstrating that the agreement had to take place in people's minds before it could become effective.

Arden does not present a clash of black and white. John is a rounded character, a slippery villain, but shrewd and energetic and gifted with the Plantagenet charm, while some of the barons are coarse and unscrupulous fighters.

The use of stylised scene emblems gives mediaeval colour to the simple staging and Arden has again invented a suitable dialect.

The Royal Pardon. 1967. M.

A play for young teenagers, that developed out of bedtime stories for the Arden children, was written in collaboration with Margaretta D'Arcy.

Squire Jonathan. 1968.

In a grim Gothic tower, centuries ago, threadbare old Jonathan, descended from kings, gloats over his treasure chest, suspicious of the Dark Men outside and desiring the White Woman. A foolish, clumsy blonde, she appears wearing a chastity belt and eventually refusing his jewels, goes to the Dark Men. The play, a dramatic metaphor, was interpreted on production as an image of Britain's current situation, Jonathan dressed as Wilson and the White Woman like a Britannia or Boadicea.

The Hero Rises Up. 1968. M.

Written with his wife, the Irish Margaretta D'Arcy, this burlesque of melodrama is a sardonic enquiry into the motivation and deeds of our national hero, Nelson, and the very differing reactions he occasioned. The authors use the racy style of period ephemera, such as street ballads, broadsheets and caricature and include "stage spectacles of sensational splendour" presented in the style of "tuppence-coloured prints".

The Ballygombeen Bequest. 1972.

The co-authors, Arden and his wife, have said in interview that while they were living in Galway they saw the commuter purchase of country cottages and the development of a tourist trade so forcing up the price of the land that some smallholders, too ignorant to know their legal rights, were being evicted.

In the first part of their play the estate-agent Holliday-Cheype, the absentee English landlord who inherits the property, exploits the ignorant tenants, the O'Leery's, until they become virtually slaves and Seamus signs a contract which leads to his wife's eviction.

Then in the period 1957–71 comes the reversal. The landlord lays false information against their radical son, Padraic, who is captured, horribly tortured by the army and killed. But like Leslie in Behan's *The Hostage* the dead Padraic rises up, singing to the tune of *O'Reilly's Daughter*, a song of protest against the oppressor. "We'll crowd around him."

The play's frank protest is conveyed indirectly in the style of melodrama and pantomime. It has been called Arden's first agit-prop play but in discussing it he has said, "I'm not an activist, I'm a writer."

The Island of the Mighty. 1972.

A play first drafted in the 50s was re-written as a television trilogy, commissioned by the B.B.C., but never produced. A third version, written at

the invitation of the National Theatre of Wales, was not staged, and Arden after a serious illness in India asked Margaretta D'Arcy to help him in re-writing the play finally produced by the R.S.C.

The Celtic Arthurian legends and the *Golden Bough* form a misty background to Arden's convincing picture of what were probably the harsh realities of life in the chaotic Dark Age that succeeded Rome's withdrawal from Britain.

The Romano-British Arthur, now nearing seventy, is a limping hero who has striven for thirty years to maintain order during the break-up of a civilisation. Nominally Christian and boasting Imperial descent he cherishes the Roman ideals of "justice, restraint of power and protection of the weak". He relies on his highly disciplined, but ageing, armoured cavalry, the loyalty of the handsome young Medraut, his nephew and lieutenant, and the diplomacy of Merlin, his poet, ambassador and spy.

Merlin, a subtle and complex personality, shares Arthur's ideal of unity but is increasingly distressed by war's cruelties. A radical young pagan poet, Aneurin, is concerned with the oppression of obscure individuals and it is one function of the poets to act as commentators offering differing insights into the confusion.

Britain is ravaged by persistent English raids and torn internally by rival chieftains, blood feuds and vengeful bandits, while the indigenous matriarchal fertility religions, suppressed by the Romans, linger secretly in distorted forms.

Again Arden shows his remarkable skill in presenting the interplay of social forces through arresting individuals, such as the turbulent roving brothers Balin and Balan, dispossessed by the English, and the obstreperous chieftain Strathclyde, in his crumbling Roman fort of Carlisle, while the plight of the most wretched becomes quickly alive in such figures as the pathetic young bondwoman, passed like a chattel from man to man.

The commanding theme is land hunger and Arthur realises that Britain's chief peril is the remorseless attacks of the English, themselves driven west by vast migration of hungry tribes. But unable to persuade the British to unite, he says that as a soldier all he can do is fight to preserve *some* fertile ground.

The old man is gradually worn down by the disunity of the British, by the growing ambition and power of Medraut and by his own inner conflicts.

His final undoing is the resurgence of the matriarchal pagan cults. This is early foreshadowed in the frightening annual fertility rituals of a desperately poor tribe of pagan Picts, the Wild Cats, who assume weird cat masks. The captured Balan becoming consort to the princess has to fight his lame predecessor and is himself ritually lamed. But the avaricious old queen, finding his brother Balin shipwrecked, orders that this ritual be re-enacted prematurely. In a scene of terror and pathos the brothers fight and kill each other and the fertility magic is also lost.

Arthur is similarly destroyed. For reasons of political expediency he marries the mischievous young Gwenhwyvar. Taught by the crone Morgan, Arthur's sister, that she represents the ancient cult, Gwenhwyvar sets her sign of the horned moon on Medraut, who is wildly acclaimed by the people. But again due ceremony has been neglected and as Medraut announces that he will claim Imperial rule Morgan despairingly tears to shreds her symbolic green fertility robe.

Meanwhile Arthur has gradually revealed that he also has been involved in the ancient superstition and that Medraut is in fact his son by ritual incest, instigated by Morgan.

In a final catastrophic battle Medraut and Arthur destroy each other and the way is wide open for the English invasion. As Merlin had foreseen, five hundred years of history were "swept away to nowhere in a pagan bog of blood and mud" and Merlin loses his reason.

The play is alive with a host of convincing characters, complex inter-relationships, violent unruly emotion and exciting incident. The dialogue is clearly individualised and with some few exceptions has both a period flavour and yet immediate freshness. The style varies between prose and verse with some passages of poetic intensity and power, especially in the weird and erotic sequences, and it conjures up a landscape of Roman ruins, wildwood and desolate shore. Interspersed are ballads, some almost doggerel, others comparable with genuine early ballads. Some songs are richly suggestive, especially the refrain that accompanies the final disaster, "O, the cruel winter/And the pain of its arrival."

Some incidents seem superfluous and it is confusing that in a confessedly anti-imperialist play Arthur should be the centre of the action.

The play has been called untidy, but "tidiness" would be inappropriate in this image of civilisation in breakdown. Despite its complexity it has an inner order and coherence and Arden has so orchestrated his themes that there is a poetic resonance in its design.

There are many levels of meaning, social, political, religious, sexual and personal, and its relevance for today is apparent in a hungry world that is torn by social, religious and racial conflicts.

The play's chief drawback is its length, further prolonged by songs, and it is regrettable that it has not been shown as planned, as a trilogy, when its complexities could be more gradually assimilated, for it is like a vast, rich and intricate tapestry, whose pattern and colours cannot at once be appreciated.

Fernando Arrabal (b. 1932).

Born in Spanish Morocco, Arrabal was early involved in cruelty. He was four years old when the Spanish Civil War broke out and his father was condemned to thirty years' imprisonment. When he was nine Arrabal was told that his father had escaped. He never heard of him again. The father, whom he had deeply loved, had been completely abandoned by his mother and this harrowing experience is given dramatic expression in *The Two Executioners*, P. He retains vivid memories of the Civil War, the mass executions and the cries of tortured prisoners and says that in schooling and religion he was "brought up on sado-masochism". When of age he broke free from his extraordinary mother and in 1955 he moved finally to France.

Arrabal's work is in the tradition of Spanish surrealism, and even before reading Ionesco and Beckett he wrote plays considered as absurdist. "His main preoccupation," says Esslin, "is with the absurdity of ethical and moral rules. He looks at the world with the incomprehension of a child that simply cannot understand the logic of conventional morality." His work, which is "a highly disturbing mixture of innocence and cruelty", has been much influenced by Artaud's Theatre of Cruelty and from 1962 he developed his ritualistic theatre as a Panic Ceremony, so called after the god Pan.

Arrabal has also experimented with abstract drama. The *Orchestration Théâtrale* of 1959 attempted to create a dramatic spectacle devoid of human content and consisting solely in the manipulation of three-dimensional shapes—some mechanical and others moved by dancers—to the accompaniment of coloured diagrams.

Arrabal's work is increasingly characterised by surrealist fantasy and the grotesque. Disclaiming imagination, he has said, "What I do is to copy my memories or my dreams . . . almost exactly, without changing a word."

The Architect and the Emperor of Assyria. 1971.

After terrifying intensity of noise the lordly Emperor descends from the skies calmly announcing to a cowering man whom he later dubs his architect that he is the sole survivor.

The situation recalls *The Tempest*, the Emperor, like Prospero, an embodiment of civilisation, the Architect an amalgam of Caliban and Ariel, a primitive, at first ignorant even of language, yet retaining magical powers over nature.

These two, the sole inhabitants of a desert island, play out an unending repetition of sado-masochistic fantasies springing from infantile traumas. All but naked they circle each other in balletic movement and mime, instantaneously exchanging such rôles as master, persecutor, judge, lover, and mother.

In Act I the Emperor is usually dominant, though sometimes sobbing for comfort in the

arms of his "mummy." In Act II he is judged by the Architect for murdering his own mother whom he gave to his dog to eat. He demands the same punishment and is killed and eaten by the Architect, who in his cannibalism sucks in the Emperor's civilisation but loses his former magical power.

Again come darkness and deafening noise, but this time the Architect descends, taking over the Emperor's rôle.

As in Triana's more disciplined *The Criminals*, the dramatic movement is cyclical, the remorseless, self-destroying recurrence of obsession, especially guilt-ridden hate and dependence on the mother. The play has some root in anthropology and recalls Artaud's theories, exposing man's most grisly unconscious motivation and deploying a most extensive range of theatrical devices. Garcia, the producer, used brilliant lighting, baroque music, and even an electric fork-lift truck on which to mount a crucifixion sequence and the Emperor's slow giving birth to the Architect!

Tense and exciting in its assault on the senses and sensibilities, the work can yet have a shattering effect on the audience, which is implicitly called on to play the exhausting rôle of untrained psychiatrist, unable to further any resolution. The basic subject is that of Aeschylus' *The Eumenides*.—matricide pursued by guilt. But the Greek tragedy is in effect exhilarating, achieving that therapeutic catharsis described by Aristotle.

And They Handcuffed the Flowers. 1973.

The title is derived from words of Lorca who in 1936 was executed by fascists. The play was stimulated by requests that the playwright would bear witness to what he had seen during his few weeks of political imprisonment in 1967 but its chief source of inspiration is his anguished childhood.

Apart from a few casual references and brief readings by a little girl sitting on a stool, few factual details about prison life emerge for Arrabal is preoccupied with the terrible distortion of the psyche caused by long years of incarceration. His three principal characters are the three inmates of a prison cell now degraded by their inhuman conditions. Their pathological urges are enacted in sado-masochistic fantasies, religious and sexual, in which the prison chaplain, hated because evasion of mass is punished by solitary confinement, is ritually castrated, the mass is parodied, there is a pornographic Christ and harsh grotesque whores invade the scene.

In contrast to the extravagant surrealist fantasies, the simplicity of some direct questions is all the more effective. "Who invented the prison? Animals don't have them."

It is interesting to compare more restrained plays written by ex-prisoners, such as Genet's *Deathwatch* and Behan's *The Quare Fellow*.

Alan Ayckbourn (b. 1939).

Ayckbourn is a successful writer of social comedy with a sharp eye for the trivial distinctions and snobberies within the middle class. He is adept in contriving ingenious incident and witty rejoinder. His craftsmanlike plays include *Relatively Speaking*, 1967, *How the Other Half Loves*, 1970 and *Time and Time Again*, 1972.

Absurd Person Singular. 1973.

A farcical comedy shows three couples participating in three successive Christmas Eve parties.

In the first Sidney, a pushing property developer, tries vainly to force party games on his more sophisticated guests, professional men and their wives. In the second guests arrive to find Eva, distressed by her husband's infidelities, with her head in the oven. Assuming she is cleaning it they unconsciously foil her suicide attempt by cheerfully rallying round to help, the tipsy Marion forcing gin on her instead of bleach. The final episode shows Eva in control of a husband now broken by her suicide attempts and Marion's husband ironically disguising his wife's alcoholism. In this final episode Sidney, though a guest, is so secure in his new wealth that he easily imposes on the others the humiliating games and forfeits they had formerly scorned.

In a neat and eventful play Ayckbourn reveals not only development in his characters but implicit criticism of a social order that can be easily reversed by the thrusting plutocrat.

Isaac Babel (1894–1941).

Between 1937 and 1957 the work of Babel, the Russian Jewish short-story writer, was banned in Russia. He died in Siberia. *Sunset*, the first of his two extant plays, produced in Russia under Stanislavsky in 1928, appeared on B.B.C. television in 1964.

Marya. 1967. P.

Written in 1933 but not yet professionally produced in Russia, *Marya* is set in Petrograd in February 1920. It evokes a precise period in history—the flux and confusion just before the Bolsheviks consolidated their power in March 1920.

The organisation of the play is poetic, the balance and interplay between two social milieus. One is the decayed elegance of the liberal intelligentsia focused in the home of Mukovnin, a former General, where the men are well-disposed but impotent, the women unchaste. The other is the squalid house where Dymschitz, the Jewish merchant turned black-marketeer, lives with his hangers-on and crooks.

As in Chekhov, the characters are studied in psychological depth and the quiet naturalism of the style is sometimes startled by sudden violence as in the shootings after the rape of Ludmilla, Mukovnin's younger daughter, and the link between the two households.

Samuel Beckett (b. 1906). *See also* Section M.

Beckett, an Anglo-Irishman, who has made his home in France, is both novelist and the most distinguished of the English dramatists of the Absurd. His world is drastically limited, peopled chiefly by old men awaiting their death, and conceived with the intensity and haunting power and suggestiveness of the true poet.

His work is poetic in its verbal imagery, sometimes as searching and macabre as that of Webster, and his dramatic prose has an underlying poetic rhythm often more flexible and effective than that of Eliot's verse. In structure his plays have a poetic symbolism, a latent significance, like that of the novels of James Joyce, Beckett's close friend, and their striking visual imagery has a kind of theatrical poetry, as for instance the two tramps at the foot of a bare tree in *Waiting for Godot*. It is remarkable that so literary a playwright should also have succeeded with the wordless mime play.

Beckett's chief weakness as a dramatist is that the action and visual imagery are frequently too static, as in the motionless dustbins in *End Game*, much less effective theatrically than Ionesco's movable chairs.

Waiting for Godot. 1955. F.

This tantalising and compelling tragi-comedy, Beckett's masterpiece, originally written in French and produced in Paris in 1953, was later translated and performed in more than twenty countries.

Character and incident are pared to the bone and only a skeleton situation remains. At evening, on a desolate road, bare but for a single tree, two wretched tramps, Vladimir and Estragon, nicknamed Didi and Gogo, wait for a mysterious Mr. Godot. As they while away the time with desultory talk and clowning, a tragi-farcical diversion is provided by the entry of Pozzo and Lucky, bullying master and wretched slave, and a boy later brings a message that Mr. Godot cannot come but will arrive the next evening. After discussing whether or not they shall hang themselves from the tree, the tramps decide to go away for the night, but remain on the spot.

Act II presents "Next day, same place," the only difference being that the tree has sprouted a few leaves, and the basic pattern of Act I is repeated.

Although by the skilful use of music-hall techniques Beckett presents his tramps in the

guise of amusing clowns, they are at the same time pathetically human as they waver between suicide and irrational hope. A fretful affection has kept them together over fifty years, and their dispositions are complementary, possibly even representing different aspects of the one personality.

Pozzo and Lucky, another pair of contrasting characters, are portrayed more farcically. The loud, confident Pozzo drives Lucky in as if he were a beast of burden. Lucky carries in his mouth the whip with which he is beaten and humbly obeys every insolent command. He dances for Pozzo and even thinks for him. In their second appearance Pozzo is blind and Lucky dumb

They may be considered personifications respectively of master and slave, worldly materialism and higher values, the physical and the intellectual, body and soul, or the two aspects of a sado-masochistic relationship.

The play as a whole is a most complex dramatic symbol expressing man's anxiety and suffering as to his origin and destination.

The uncertainty is symbolised by the characters' confusion as to even the physical actualities of time and place, but the dominating symbol is the tramps' doubt as to Godot's identity and purpose.

Such an oversimplified interpretation as to equate Godot with God is inadequate, yet the play has undoubted Christian references. A tree is frequently used as an emblem of the Cross. Beckett, questioned about its theme, quoted a wonderful sentence in Saint Augustine, . . . "Do not despair; one of the thieves was saved. Do not presume; one of the thieves was damned."

Beckett neither affirms nor denies Saint Augustine's statement but inverts it into a question, more distressing than direct denial. Can we any longer accept the existence of divine grace and judgment? It is a question such as this that gives to the play its symbolic shape of doubt, and which is cogently expressed in the theatrical image of two outcasts at the foot of a tree, a tree of life which puts forth leaves, a tree of death which they contemplate using as a gallows.

Yet the significance of the play is even deeper than an exploration of religious doubt, its appeal wider and more contemporary. The anguished uncertainty of the 20th century is whether life has any meaning whatsoever and the play shows the suffering of man, lost and anxious in an apparently meaningless universe.

Some have considered it to be written from the point of view of existentialism: continuing vainly to hope for a supernatural revelation, the tramps lack the courage to come to terms with the nothingness of our existence and the need to choose and create our own destiny.

A Jungian psychologist, Eva Metman, has made a similar interpretation, remarking, "Godot's function seems to be to keep his dependents unconscious."

"Habit is a great deadener," says Vladimir. If Beckett's play enables the audience to escape the drug of habit and to face this image of anguish and so find some relief, then it may have the therapeutic value of that inner knowledge advocated by Freud and Jung.

It is not a play for those who cannot bear to suffer. When performed in San Francisco Gaol, the first play there for forty-four years, it held its audience of fourteen hundred convicts spellbound. They realised that each must find his own personal message. All knew that it spoke to those who must suffer and wait.

Endgame. 1958. F.

Also re-created from the French, this play again depicts a static situation. In a single, claustrophobic room, the selfish, materialistic Hamm, who keeps his senile and legless parents in dustbins, is now paralysed and blind and dependent on his servant Clov, who longs to leave him. But if Clov should leave, both would die, for Hamm owns the only store of food in a devastated and dead world. Finally Clov sees outside what may be a small boy, "a potential procreator," and he prepares for departure but remains immobile.

The play like poetry can be interpreted in several ways. Since Hamm and Clov are mutually dependent, it probably represents tension between complementary aspects of personality. Hamm sensation and emotion, and Clov intellect. As Clov has vision and sees the boy, the situation suggests the struggle of the mystic endeavouring to escape from a deadening materialism to a vital awakening of the spirit. It may also depict a period of traumatic depression when the whole external world seems dead and unreal. The play's overall impression is that of the dissolution of the personality in death, both personal and global.

Endgame lacks the wry humour of *Waiting for Godot*, and is less compelling than Ionesco's *Exit the King*, but is more potent in its latent imagery than is Ionesco's play.

Krapp's Last Tape. 1958. F.

In the briefest sketch, Krapp, a solitary, decrepit, unsuccessful old man listens to his own autobiographical tape-recording of thirty years ago, but the moment of miraculous insight it commemorates is now so meaningless to him that he switches off that section of the recording and broods on a description of his love-making.

Beckett employs a most effective stage device to pose contemporary queries as to the limitations of verbal communication and the continuity of personal identity.

Happy Days. 1962. F.

Winnie, buried to her waist in a mound of earth, assiduously tries to fill in the time between the waking bell and the bell for sleep with the routine of nail filing, with rummaging in her capacious bag, with memories of her first kiss and of her husband's proposal and with a flood of talk adjuring cheerfulness, "ah yes . . . great mercies". In rare moments with bent head and breaking voice she says, "What *is* one to do? All day long. Day after day", but soon, lifts her head with a smile—"The old style!"

She shows tender concern for her husband, Willie, whose bald head topped by a boater is just visible behind the mound. ". . . just to know you are within hearing and conceivably on the semi-alert, is—er—paradise enow," she says, overjoyed at his rare and monosyllabic replies. To his answer, "It", she cries, "Oh you are going to talk to me today. This is going to be a happy day!"

In a brief second act Winnie is buried to her neck. Willie "dressed to kill" in a morning coat crawls from behind the mound and collapses while trying to reach her. She is shocked that he may have gone out of his "poor old wits". Just audibly he says, "Win", and the happy expression grows on her face.

It is possible to conjecture several interpretations, the most obvious being that of the woman becoming paralysed by illness and unable any longer to make contact with or help the husband who appears to have psychological difficulties. Poor Willie had always been in "dire need of a hand". In her bag is the revolver he had asked her to take from him. Now he can barely communicate, hardly crawl and has to reverse into a hole which shelters him, an image suggesting Beckett's recurring theme of a desire to regress to childhood and the womb.

The theme is suffering but the surface of the play is rich comedy.

Play. 1964. F.

Beckett's own directions best describe the striking imagery of a brief one-act play. "Three identical grey urns . . . From each a head protrudes, the neck held fast in the urn's mouth . . . They face undeviatingly front throughout the play. Faces so lost as to age and aspect as to seem almost part of the urns."

The heads are those of a man between two women, apparently his wife and mistress. With impassive faces and normally toneless voices each utters a monologue. At first there builds up a vivid and amusing picture of a man who had passionately loved two women who were possessive and bitterly jealous of each other. When the man suddenly disappears from an impossible situation the voices become dim and lower, for all three are left isolated living in a limbo of obsessive memory and sadness, yet touched by pity for each other.

The imprisoning urns effectively symbolise their self-absorbed condition.

Not I. 1973. F.

In a play lasting only fifteen minutes Beckett pares every thing down to the barest essentials. On a dark stage there is a dimly lit mouth appearing totally disconnected from the rest of the body and downstage a faintly visible Auditor, intent on Mouth, cloaked and silent and all but immobile.

Mouth (Billie Whitelaw) pours forth a flood of disjointed phrases, voicing the anguish of a woman nearing seventy to whom she persistently refers as "She". Some few facts emerge. Born prematurely and deserted by the mother she had been an unloved waif with "no love of any kind . . . at any subsequent stage" and "practically speechless . . . all her days".

One early April morning "wandering in a field . . . looking aimlessly for cowslips" she had suddenly experienced some extraordinary shock, finding herself barely sentient and aware only of darkness with a beam of light "ferreting around" and a "dull roar in the skull".

Later, came thoughts that she was being punished, that she was "not suffering" at any rate "so far" and then the sudden realisation that "words were coming" and that "a voice she did not recognise . . . at first" must be her own, followed by the sensation of her mouth actually moving, "mouth on fire" but "no idea what she's saying" and with "the brain . . . raving away on its own . . . trying to make sense of it . . . or make it stop".

The frenzied monologue is four times punctuated by a vehement disclaimer that Mouth is speaking of herself, when, as if in answer to questions she cries, "what? . . . who? . . . no! . . . she!" while the silent Auditor raises and drops his or her arms in a gesture of hopeless compassion. The play expresses complete despair save that the closing words suggest a desperate courage as Mouth gasps, "not knowing what . . . what she was trying . . . what to try" but "no matter . . . keep on . . . hit on it in the end" while her repetition of religious phrases is no longer accompanied by harsh laughter but may even have a kind of grace, "God is love . . . tender mercies . . . new every morning".

The monologue has some basis in commonplace fact with references to shopping in the supermarket and an appearance in court and it might be interpreted as occasioned by a stroke or as expressing the long suppressed agony of an autistic or schizophrenic personality. But the play has a much wider and deeper reference, for it is a most moving and poignant dramatic image of the lonely anguish of man enmeshed in the dark enigma of human suffering and desperately seeking meaning in what may appear to be the futile nullity of life seen in retrospect.

Brendan Behan (1923–64).

Behan, a Dubliner and author of *The Borstal Boy*, had only two plays produced in his lifetime, *The Quare Fellow*, his best work, and *The Hostage*, both of which draw on his own experience as a political prisoner and in the I.R.A.

The scripts were sent to Joan Littlewood (*q.v.*) and considerably altered, for they were much too brief and formless and "chunks of terrible sentimentality" had to be cut out. Joan Littlewood extended the plays considerably, gave them some shape and produced them in her own original style, Behan's views on capital punishment and political strife being presented in comic terms.

A third play, *Richard's Cork Leg*, which Behan left unfinished, was edited and completed by Alan Simpson.

The personnel of Behan's plays are generally wildly eccentric and their world randy and bizarre. Lacking structure the plays rely on a vivid impressionistic style, lively and voluble. Their bold use of words was something new in the 50s and as Tynan said, language was "out on a spree, ribald, dauntless and spoiling for a fight."

The Quare Fellow. 1956. M.

The play was an effective plea for the abolition of capital punishment. Its claustrophobic scene is an Irish gaol during the twenty-four hours preceding the execution at 8 a.m. of "the quare fellow," a brutal fratricide. The murderer is never seen and the sombre theme is presented obliquely, masked by the harsh irony of prison jests and the alternation of farcical and macabre incidents as the unnerving effect of impending death is shown on prisoners and warders. Although the play has little plot its structure was tautened by Joan Littlewood.

The film version is a distortion.

The Hostage. 1958. M.

Again the basic situation is waiting for an execution. The scene is a Dublin brothel. Here Irish patriots bring young Leslie, captured Cockney soldier, as hostage for an Irish political prisoner in Belfast who is to be executed next morning.

There is touching pathos as a little Irish maid tries to save Leslie, neither of these orphans realising what the strife is about, and in a raid on the house Leslie is shot. But the mood is held only for a moment as he leaps up and sings "The bells of heaven go ting-a-ling" and so the play ends.

The pathos and tension of Leslie's plight is inconsistent with the rest of the play where the prevailing mood is one of comedy. This is engendered by a host of irrelevant characters and the action is constantly held up by satirical songs and some mediocre backchat. This pseudo-Brechtian trimming detracts from the growing sense of alarm as Leslie gradually realises his fate.

Although in 1958 the play succeeded in making the business of war appear childish, when revived in 1972 during the civil strife in Ireland its inconsequential tone seemed irresponsible and dated.

Richard's Cork Leg. 1972.

A posthumous work begun in 1961 was completed by Alan Simpson.

In typical Behan fashion and making no pretence to form, the play has the inebriate atmosphere of the pub. Its motley group of Hogarthian caricatures includes two loquacious whores, two men posing as blind beggars and a corpse, while a string band strays in and out with Behan ballads to traditional tunes. They wander from a Dublin graveyard to other improbable sites, exchanging ribald jests on politics, sex, religion and death, but apart from a seduction on a tombstone there are few events and no direction. The casual finale is an accidental shooting, but the victim, like Leslie in *The Hostage*, pops up again.

The play lacks the tension which informs those produced by Joan Littlewood.

Alan Bennett.

Bennet was one of the participants in the witty, satirical revue, *Beyond the Fringe*, and in the television programmes that followed.

Forty Years On. 1968. F.

The retiring Head Master (Gielgud) of Albion House, a minor public school, is entertained by a cavalcade of twentieth-century British history, devised by his Radical successor and enacted by the boys.

The rather loose organisation of the play gives opportunity for entertaining, satirical skits on the public school and on the middle class, where Bennett can exercise his special talent for parody.

Esslin has pointed out that the format is similar to that of the *Marat Sade* of Weiss.

Getting On. 1971. F.

In his cluttered Highgate home George Oliver, Labour M.P. in his forties, surveys with dismay the onset of age and the prospect of a mediocre future, where the hand has been dealt.

His youthful enthusiasm for the Welfare State now disregarded, George voices Bennett's free-wheeling satire on current trends in a picturesque idiom, biting, witty, comic, sometimes merely facetious.

Although concerned, he is too busy talking to be fully aware of the lonely predicament of his wife, teenage son, and friend, his Tory pair. Social

satire constitutes not only the surface but the driving force of a comedy which, like Nichols' *Forget-me-not Lane* (*q.v.*) is very funny but sad.

Habeas Corpus. 1973. F.

Bennett's very successful farcical comedy flaunts his highly coloured middle-class characters in the style of the comic seaside postcard.

Most are preoccupied with their bodily idiosyncracies. The aging Dr. Wickstead of Hove (Alec Guinness) still desires his female patients, his wife contemplates her menopause with consternation, his son Dennis is hypochordriac, his flat-chested sister Constance is wretched until she acquires a falsie bra. Sir Percy Shorter furious that his name matches his short stature and the celibate Canon Throbbing are improbable rival suitors for Constance.

Dennis marries the lovely Felicity, daughter of Shorter's former flame. The design is ingenious, the humour is like that of revue and lies in the aplomb of the caricature and in the peculiar tone of Bennett's wryly cynical wit. "My breast is full of happiness," says Felicity. "And mine of cellulose," adds Constance.

The far-fetched comparison and outrageous statement delivered in the flat prim tone are now Bennett's hallmark.

Robert Bolt (b. 1924).

Bolt has recently said, "I do like plays in which the people have ideas as well as predicaments" and he is one of the few dramatists who have scored West End successes with the play of ideas. He holds the balance of discussion so fairly that only in the outcome is it clear that he himself is committed. His earlier work, represented by *The Flowering Cherry* (1957), with Ralph Richardson, was in the realistic convention, but more recently he has experimented with other dramatic techniques, owing something to Brecht and to the Theatre of Cruelty and of the Absurd.

The Tiger and the Horse. 1960.

This play takes its title from Blake's "The Tygers of wrath are wiser than the horses of instruction." It is concerned with the inadequacy of detachment, the philosophy held by Jack Dean, (Michael Redgrave), the Master of an Oxbridge college, the well-balanced man who represents Blake's "horse," while his wife, Gwen, the "tiger," passionately concerned for the world's suffering, shows signs of neurosis. The action revolves round her wish to sign a petition for unconditional nuclear disarmament and Dean eventually, to save her from mental breakdown, bravely identifies himself with her and the cause, thereby deserting his philosophy and his career.

In its outcome the play stresses the value of social idealism, stifled as it may be by philosophic detachment and the pressures of conformity. It is typical of Bolt's dialectic that this value should be upheld by the disturbed Gwen and by Louis, an oddly irresponsible young man.

Bolt departs from the realistic style by trying to make his characters larger than life in being unusually articulate about what they stand for.

A Man for All Seasons. 1960. P.

Here Bolt attempts to give his characters heroic dimensions by striking back into history.

Believing that our need today is a sense of personal individuality or "self hood," he chooses as his hero of "self hood" Sir Thomas More. Bolt consciously uses the dramatist's privilege to adapt history to his own purpose, for the theory of conscience accepted by More was not subjective and existentialist but identical with that of Thomas Aquinas. Hence some inconsistency in his portrayal.

More was described by one of his contemporaries as "a man for all seasons" and Bolt presents More (Scofield) as not only flexibly adjusted to Renaissance society but also preserving an inner core of unassailable integrity. Suspected of a critical attitude to Henry VIII's divorce, he used his skill in "the thickets of the law," yet resolutely refused to swear the oath to the Act of Succession that would have released him from the Tower and the block, because for him perjury meant the loss of the soul, the self. His constancy is thrown into relief by the growing corruption of Richard Rich, whose final perjury sends More to his death.

Bolt's More challenges comparison with Brecht's Galileo. He also is a man of supreme intelligence, whose inner certitude of truth is persecuted by an absolute power. He also skilfully avoids open clash until he must eventually make a final choice between astute temporising and commitment of his life to his belief. The difference is that More opts unequivocally for constancy.

Bolt uses what he calls a "bastardized version" of Brecht's style. Episodic scenes are strung along a strong thread of intellectual argument. There is also a commentator in the form of the Common Man, who with the aid of property box takes a swift succession of minor parts, changes of rôle which throw into relief the steadfast individuality of More.

Bolt, like Brecht, believing that beauty of language is a means of "alienation," matches fine passages from More himself with his own appropriate use of wit and imagery, using images of land to suggest society and its laws and those of water and sea the superhuman context.

The film version has been highly praised.

Gentle Jack. 1963.

Bolt depicts the conflict between the natural spontaneity of nature, represented by the magic figure of folk-lore, Jack-of-the-Green (Kenneth Williams) and the inhibitions of society in the person of Miss Lazara, a plutocrat (Edith Evans). Since Bolt believes that the modern doctrine of the return to nature may lead to violence, Jack finally contrives two murders. Bolt in dealing with this conflict could not, like Euripides in *The Bacchae*, draw on a familiar myth, and his allegorical plot proved puzzling, while the setting was too reminiscent of *Dear Brutus*. The play is too cerebral, the characters are more blueprints than flesh and blood.

Vivat! Vivat Regina! 1970.

The play has two 'heroines'—Elizabeth I and Mary Queen of Scots. In the same predicament, the conflict between royal statecraft and woman's desire for husband, child, and heir, they are in temperament sharply contrasted. Mary is shown as sophisticated, sensuous, passionate, and self-willed, ruthlessly conniving at plots to murder her rival. Elizabeth, listening to Cecil and Walsingham, foregoes her love for Leicester in the interest of the realm.

Since the period spanned is virtually that of Mary's return from France until her execution (with just a hint of England's coming victory over the Armada) she is the main dramatic focus, although Elizabeth's astute dialogues with her advisers are more interesting.

Bolt does not attempt the subtle complexity of *A Man For All Seasons* but he shows admirable expertise in the handling of space and time. Discarding realistic sets he employs emblematic properties, such as thrones, pulpits, desks, and heraldic biazons. Clever selective lighting serves to make viable even the exchange of letters. Thus the action shifts unhindered between places wide apart and moves swiftly through the years.

Edward Bond (b. 1935).

Bond had a most unfortunate start in life. The son of a labourer in North London, twice evacuated to the country, he says that his whole relationship with his family "was one of total suspicion", and that his education at a London secondary modern school "consisted of one evening," when he was taken to see Wolfit in *Macbeth*. He left at fifteen to take up casual employment, and generalising from an apparently meagre experience now asserts, "There's really no difference between our State prisons and our State schools" since they both are "training alienated slaves who will fit into our society."

He appears to have read widely, not always with the ability to discriminate, even in drama, as witnessed by such assertions as, "The nearest

thing to a Brecht play in English is the Victorian melodrama."

Bond shares the appalled dismay of most sensitive people at contemporary violence and war, the drab monotony of industrialisation and the stifling of individuality but he is not yet in full control of his material. Interviews with him endorse the impression that much of his work is motivated by the compelling need to exorcise his own emotional difficulties. Hence the strange, emotive power of his images, often as violent and gruesome as nightmare. But there is an uneasy alliance between his bold intuitive imagery and his conviction that his work serves as a timely warning of the dangers threatening mankind. The tenuous moral fable threading the background of his plays and fabricated to rationalise the episodic violence is seldom very convincing. Lucid reasoning is not his forte.

Although he justifies his plays' obsessive violence as a warning of potential genocide, it is at least arguable that it is a symptom of human malaise. Moral indignation is a suspect emotion, often self-indulgent and betraying ignorance of oneself and of human nature.

At one time Bond attempted to rationalise his intense hostility to all authority by a naïve Romantic anarchy, asserting, "Society . . . makes men animals." In *Lear* there are signs that he now recognises individual responsibility.

Those who hope to find in his plays psychological insight or that portrayal of everyday compassion and love which unconsciously stimulate us to emulation will find scant nourishment. His work is intense, partial in vision, narrow in scope and rather humourless.

Opinions are divided. Some critics, like Esslin, rate Bond highly and he is appreciated on the Continent. Many playgoers remain doubtful.

Saved. 1965. M.

As a result of casual sexual intercourse with the promiscuous Pam, Len gets involved with her morose South London family, with Fred, the putative father of her baby, and with Fred's lewd gang, which murders the baby on the stage.

Since the play is largely in delinquents' argot, and is limited to a photographic study of inarticulate people, it is in itself somewhat inarticulate, but it constitutes a frank and compassionate social document.

Early Morning. 1968.

Esslin interprets this play as infantile fantasy. The archetypal authoritarian figures of mother, father, nurse, and grown-ups appear as Queen Victoria and the Consort at deadly emnity, Florence Nightingale, on whom Victoria has a Lesbian crush, and Gladstone and Dizzy waging civil war. The princes, Siamese twins, suggest sibling rivalry, and the final scene is a nightmare eternity of mutual cannibalism, whose psychoanalytic significance is oral eroticism and sadism. Esslin judges the play absurdist, innocuous as satire, but with an underlying substance "of great seriousness and poetic power."

Wardle says Bond is writing like a wrathful, "omnipotent baby" presenting a "solipsistic muddle," meriting case-book study rather than dramatic criticism.

Narrow Road to the Deep North. 1968. M.

The setting, visually very beautiful, is 17th-century Japan, where the War Lord, Shogo, is eventually overthrown by the Commodore, a "bragging mindless savage," representing Western civilisation, with the tambourine-banging Georgina, a somewhat outdated image of missionary zeal supporting imperialism.

Shogo maintains order by sheer atrocity, Georgina by inculcating also a puritan sense of sin, the "message" being that government is *per se* evil and our only hope the naked man, who finally rises from the river (recalling the Romantic myth of the "noble savage").

Bond's dubious dogma overlays the most moving aspect of the play, its latent plea for individualism.

Black Mass. 1970.

For the Sharpeville commemoration Bond wrote a bitter satire, showing a priest corrupted by the power of politician and police.

Lear. 1971. M.

Bond employs two devices. He drastically alters the basic situation and story line of Shakespeare's *King Lear*, whittling it down to a political fable, and he presents a symbolic object, a huge wall, representing man's posessiveness, fear and aggression.

The furious Lear visits the wall which he is erecting against two hostile dukes, whereupon one of the workers is promptly executed, and his two daughters, Bodice and Fontanelle, provocatively announce their marriage to the dukes. They soon make away with their husbands, seizing power and defeating Lear, who is left wretched and vagrant. A young peasant woman, Cordelia, daughter of a priest, who had been urging her husband to erect a fence (evidently a microcosm of the wall), is now in ruthless command of victorious guerrilla forces. She has the sisters killed and Lear blinded by a "scientific device." He lives on, accompanied by the ghost of Cordelia's husband, who experiences a second death. Finally, Lear, feebly attempting to dismantle the wall which Cordelia now feverishly maintains, is shot dead.

The horror of gruesome maimings and killings which are almost unrelieved indicates that Bond is beginning to recognise that evil is inherent in man, although his own comments again rationalise such violence as occasioned by a repressive society. He says that contemporary life is bearable to no one "unless he'd been made morally insane"—a state "brought about by our education and the enormous pressure to conform."

The play is intended as an agonising protest against contemporary life. But is the protest effective? Only the individual playgoer can say which is the more potent deterrent of violence—Bond's surfeit of horror or the single powerful scene of Gloucester's blinding (*King Lear*, Act III.7).

To convey his message Bond eventually resorts to crude verbalism, as when Lear says, "We have only one thing to keep us sane; pity, and the man without pity is mad." But this is moral preaching not drama.

In *King Lear* Shakespeare did not have to resort to preaching, for his play *represents* that tension between contraries which is the essence of tragedy. It is permeated by the saving theme of loyalty, compassion and reconciliation. Subtly dramatised in manifold incident and in such richly diversified personalities as Kent, the Fool, Edgar, the Physician, it reaches its apotheosis in Cordelia and the incomparable and moving scene where she tenderly waits for Lear to wake from his madness—

> "O, Look upon me, sir,
> And hold your hands in benediction o'er me.
> No, sir, you must not kneel."
>
> (Act IV. 7).

Bond however says, "The Cordelia figure was very unsatisfactory in Shakespeare . . . He can't deal with her. My view is that she is a moralised person and moralised people are not good people."

The verdict is with the playgoer and posterity.

The Sea. 1973. M.

It is refreshing to see Bond entering new territory in a play which although bizarre has a realistic setting, an East Coast village in 1907, whose social life is dominated by the imperious Mrs. Rafi (Coral Browne), a wealthy widow. It begins with the drowning of Colin, the fiancé of her niece Rose, and his death is the pivot of the play.

The village draper Hatch (Ian Holm), who is facing bankruptcy through Mrs. Rafi's haughty caprice and cancelled commissions, has become paranoic and suffers from the hallucination that his own and the world's troubles are caused by the evil influence of beings from a hostile planet who plan to invade the country from the sea. As a part-time coastguard he had been on the beach during the stormy night when Colin's boat had

capsized, and dominated by his fantasies he had repelled Colin's devoted friend Willy, who had however survived. When Mrs. Rafi refuses to buy from Hatch the yards of costly velvet she had specially commissioned Hatch abandons his obsequious tone, loses control and threatens her with the scissors. Eventually as she conducts Colin's funeral in a strange service on the cliff-top he attacks her and is taken away out of his mind.

The play which is described as a comedy has a long farcical scene representing a ridiculous rehearsal in which Mrs. Rafi, assisted by her retinue of vicar and genteel ladies, plays Orpheus seeking Eurydice, but the incident has little relevance to the play. There is also satiric comedy when at the funeral Mrs. Rafi gives way to furious jealousy that her companion's display of feeling may divert attention from her own rôle as leading lady. But the tone of this extraordinary scene is not consistent for it involves awe, irony, pathos and the macabre as Colin's ashes are carelessly spilled and pelted at Hatch.

The spirit of comedy is more evident in a new understanding and sympathy for the individual. Even Mrs. Rafi, a cowardly bully who has found it " safer to stay in the garden and shout over the wall ", reveals her gnawing fear of dependent old age in a wheel-chair.

The personal grief of the bereaved Rose and Willy and the growing love between these sincere young people is depicted with tenderness and their decision to marry and leave the village to begin life afresh sounds a note of hope which is encouraged by Evens the old beachcomber.

The theme of the play is the crippling and distorting of human nature by the manipulations of a social élite but the indication in *Lear* that evil is not solely attributable to society is here explicitly expressed in Evens's pronouncement, " People are cruel boring and obsessed." In the final scene he serves as a mouthpiece for some involved speculation which the play's structure cannot entirely support.

Bingo. 1973.

In *Bingo* or " scenes of money and death " Bond again limits himself to a precise locality and period, Stratford-on-Avon in the early seventeenth century and his portrayal of Shakespeare the man finds support in an interpretation of an extant document and in literary tradition.

Bond seizes on the oft-discussed anomaly between the humane spirit of reconciliation that animates *The Winter's Tale* and the shrewd business acumen of the owner of New Place, and his Shakespeare is a deeply divided and withdrawn man, sensitive and concerned for the suffering of the poor yet trapped by his own desire for gain. He allows the ruthless William Coombe, predecessor of the modern property-developer, to secure his agreement to the enclosure of common land at Welcombe—regardless of the impoverishment and suffering of the common people, as represented by the homeless woman who strays into his garden and is flogged for vagrancy and later hanged.

Shakespeare's wealth brings him nothing but increasing disillusion and despair. His daughter Judith, grown bitter, is harshly obsessed with what he may bequeath her. Ben Jonson comes o Stratford to borrow money and persuade him to return to the theatre but fails on both counts and Shakespeare stumbles home from their drinking bout at the inn, carrying the fatal potion Jonson has just handed him. Locking the bedroom against his furious wife he slips the famous will under the door and dies wretchedly on the floor.

In a letter to *The Times* Bond stated that " the contradictions in Shakespeare are those in our own society " and his more disciplined focus certainly gives the play a sharper relevance but many critics have found in it a pessimistic despair of humanity that lies deeper than social contradictions.

John Bowen.

Bowen first won recognition as a novelist.

After the Rain. 1967. F.

Bowen dramatises his own novel, where after a great deluge ill-assorted survivors drift on a raft and enact a version of history. Meanwhile the dictatorial Arthur imposes on them his authority, first as dictator and ultimately as god.

Bowen dramatises this fantasy by setting it in a conventional framework: a history lecture given in A.D. 2197 on the origins of the new society descended from the party on the raft. Hypnotised criminals, guilty of such crimes as individuality, are used at intervals as teaching aids. They enact the story of the raft, until eventually Arthur (Alec McCowen) rebels, preferring death to his dramatic rôle.

The lecture serves as a conventional apologia to the enactment, which eschewing scenery and properties, makes use of the experimental techniques of Weiss's *Marat Sade.*

Little Boxes. 1968. M.

A double bill of realistic well-made plays again shows little communities in isolation. In this instance both groups have withdrawn deliberately from society.

In *The Coffee Lace* a pathetic vaudeville troupe, elderly and poverty-stricken, have refused to go out since their performance was cruelly ridiculed thirteen years previously. *Trevor* shows a young Lesbian couple. One girl anticipating her parents' visit pays an actor to pose as boy friend. But both sets of parents arrive and lively farce develops as Trevor attempts simultaneously to attend two parties and to cook scones. All the parents depart refusing to admit the girls' relationship and the play ends on a sentimental note.

The Disorderly Woman. 1969. M.

Bowen follows Anouilh in his capable adaptation of a Greek play, Euripides's *The Bacchae,* to a modern idiom.

Bertold Brecht (1898–1956).

Perhaps the most original and vigorous dramatist and producer of the century, the Bavarian Brecht was remarkable in his command of both literary and theatrical genius.

His practice and theory underwent constant modification. Early plays, like *Baal,* written to provide entertainment, reveal a satiric and anarchic attitude, and in 1928 the ironic *The Threepenny Opera* (P), made him famous. From 1930 onward his work became explicitly communistic, marked by the rejection of the individual in favour of a social ideal. But although Brecht always remained " committed " to Marxist ideology, most of his later plays, written after his withdrawal from Nazi Germany, are less didactic than humanist in spirit and it is by these mature works that he is best known in Britain.

After 1949 Brecht consolidated the famous Berliner Ensemble in East Berlin, where he developed his influential techniques of production.

The most permanent feature of Brecht's mature drama are the Epic form and the *Verfremdung,* or " alienation " effect, both developed in reaction to the traditional dramatic form, which he dubbed " Aristotelian." He considered that the closely constructed Aristotelian play, which encourages the audience's emotional participation in the action, syphons off the spectator's emotion, leaving him a passive and acquiescent member of society.

According to Brecht, the drama should be not ritual but debate. The spectator should be a detached observer, calmly investigating the view of the world that confronts him, rationally considering arguments and stimulated to decisive social action. It is taken for granted that he will find the solution to problems in communism.

Brecht therefore developed his " Epic," or narrative play, loosely constructed with a sequence of individual scenes, functioning as independent dramatic illustrations or quotations to the narrative.

He uses a variety of techniques to establish the narrative tone, such as an actual story-teller on the stage, explanatory verses relayed before the scenes, and banner headlines which foretell the events to be portrayed. Although by throwing the action thus into the past tense, he discards the lure of suspense, his dramatic intelligence, vigour, and inventiveness excite lively interest and curiosity.

To break down the traditional identification of the spectator with the action, Brecht developed his celebrated "alienation" effect, devising techniques to keep him at a critical distance. This implies using an image that suddenly makes the familiar appear strange and novel to the onlooker, so that he is shocked into recognising its significance.

His productions were thus avowedly non-realistic and theatrical, sometimes appearing like an inspired charade. He used not only direct narration but direct address to the audience, formalised settings and properties, masks and stylised make-up, sometimes grotesque in character. His text, "scarcely more than a prompter's copy," was freely adapted during rehearsal, so that an acquaintance with the pattern of Brecht's mime and gesture is often necessary to the full understanding of his plays.

Few find in Brecht's mature work the plea for communism that he intended, and many of his protagonists, designed as exponents of capitalist villainy, appeal strongly to the sympathy. The compelling and fascinating central ambiguity can be ascribed, as Esslin has pointed out, to the tension between Brecht's conscious reason and the unconscious emotional experience on which every creative writer must intuitively draw. This profound tension is the major source of Brecht's power.

Brecht's influence has been pervasive, especially on the dramatists Arden, Bolt, Whiting, and Shaffer, and on the producer Joan Littlewood. Above all his iconoclastic attitude and his fertile experiment have been invaluable in encouraging a new and empirical approach to drama.

Esslin's book *Brecht: a Choice of Evils*, 1959, is authoritative.

Baal. Written 1918.

The amoral vagabond poet, Baal (O'Toole), driven by instinct and emotion, expresses the subjective experience of the youthful Brecht.

Man is Man. Written 1924–25.

A most amusing early comedy marks the turning point from the anarchic hedonism of plays like *Baal* to Brecht's didactic Marxism.

The setting is a Kipling-like India, and its theme of brain-washing is prophetic. Three soldiers looting a temple have lost the fourth of their squad and to cover up their escapade they prevail on the meek, pacific Galy Gay to assume the identity of the lost Jip. Once in uniform Galy is manipulated into believing himself guilty of fraud, and after a mock trial, execution and fainting fit, he attends his own funeral, thereafter to become the fierce aggressive soldier. Minor characters undergo parallel transformations.

The unscrupulous camp follower, the Widow Bigbeck, is like an early sketch for Mother Courage, but without her maternity.

Galileo. Written 1938–9. M.

Brecht intended Galileo's recantation as an image of the scientist's allowing the State to assume authority over science. It has also been interpreted as Galileo's cunning expedient, allowing him to continue research.

Mother Courage. Written 1939. M.

In his panorama of war's futility, Brecht designed Mother Courage—a camp follower in the Thirty Years' War—as an epitome of the haggling profiteer. But his intuitive understanding of this dynamic, maternal figure, bereaved eventually of all three children, has endowed her with an ambiguous fascination.

The Good Person of Szechwan. Written 1938–40. M. P.

Shen Te (Peggy Ashcroft), the benevolent prostitute, has to disguise herself as Shui Ta, the harsh task-master, in order to survive in an unjust commercial society.

Puntila. Written 1940–1.

The drunken generosity of the mean landowner, Puntila, designed by Brecht to highlight his harshness when sober, has however given him an attractive inconsistency. The chauffeur who rejects Puntila's daughter, is a Schweikian character.

The Resistable Rise of Arturo Ui. Written 1941.

The late British première, 1967, of a minor play vividly illuminates Brecht's principles and method. The Chicago thug, Ui, and his cronies burlesque Hitler and his entourage and the horror of Nazism is offset by the brilliant clowning by Rossiter of Ui's abject cowardice and monstrous arrogance. The play successfully parodies Shakespeare's verse, especially in *Richard III*, but the picture of Chicago gangsters as vegetable dealers is unconvincing.

The Caucasian Chalk Circle. Written 1944–5. M. P.

The prologue to this delightful fairy-tale constitutes an overt plea for communism rare in Brecht's later work. The rascally judge Adzak, who takes bribes from the rich and gives judgment in favour of the poor, is one of Brecht's typical contradictory characters.

Howard Brenton (b. 1942).

Brenton is one of the foremost writers of the Fringe, his early plays *Revenge*, *Fruit* and *Christie in Love* being cleverly tailored for the small touring company, but his full-length *Magnificence*, 1973, was especially commissioned by William Gaskill for the Royal Court.

Brenton is a very modest writer. "One of my blazing faults", he says, "is that I understand the 'agit' bit but I have difficulty with the 'prop'." Like many of his generation he is stirred by a sense of impotent rage. His originality is his struggle to clarify his ideals for a just society and the ideological struggle mirrored in his plays is for many people more telling than overt ready-made propaganda.

Fruit. 1970.

An osteopath exploits his privileged knowledge of the failings of eminent men who are his patients, including a Socialist leader who drinks and a homosexual prime minister. Brenton's sweeping condemnation of the corruption engendered by power involves all but a Leninist working man.

Lay By. 1971.

Brenton and Hare (*q.v.*) combining with five others to write a play found their starting point in a laconic newspaper report about the legal aspects of a case of fellatio.

The play takes as subject some unsavoury trends in modern society, notably sex perversion, pornography and drug addiction.

The girl Lesley, a pornographic photographer's model, and a drug addict, is given a lift by Jack. In the back of his van in a lay-by he commits fellatio with her and assaults her, in the presence of his mistress, a teacher and mother of five, whose husband has left her. Jack and his mistress, now pregnant, are convicted and imprisoned. Later all three are brought together again, dead, in a hospital mortuary.

A final surrealist incident is introduced as satire on society's callous indifference to the individual but the imagery, although gruesome in the extreme, is in its implications not sufficiently clear, and many consider that the sensational portrayal of perversion is in itself degrading to the individual.

Hare said that in their communal method of writing they had to be "incredibly ruthless" with the characters, treating them "as pasteboard to move around" believing that in performance "such humanity as they have would come through".

Brassneck. 1973.

The collaborators Brenton and Hare have said "We wrote the play line by line together. The work is indivisible." It is also highly effective and disturbing.

"Brassneck" is a Midlands' word meaning "impudence, nerve, cheek", and has "a criminal inference". The play, which is a sweeping in-

dictment of corruption, financial and political, presents a panoramic view of civic life in a Midland town between 1945 and 1973, traced through the dubious activities of three generations of one family, the Bagleys. Their progress is cleverly synchronised with the decline of post-war England by means of topical background photographs, music and song.

The parvenu Bagley, making contact with a shady solicitor and a venal Tory house agent, forces his way to civic power by means of unscrupulous property speculation and membership of the Masonic Lodge, of which he becomes Master, the Conservative Club and the golf club. The members of these strongholds of the establishment, moved only by self interest, also reluctantly admit as members the newly elected Edmunds, Labour M.P., and the Marxist representative who becomes Mayor and the Bagleys' servile agent. All seeking personal gain they work in collusion together.

In the second generation Roderick, a dubious architect, continues to extend the affluent Bagley empire by means of the calculated gift and prearranged tender, until he is suddenly bankrupt, his bribery disclosed and his accomplices involved. Edmunds, now Leader of the Opposition, has to retreat to the Lords.

Finally in the third generation, Sidney, Etonian spiv and owner of a strip-tease night club and brothel, gathers together the family and cronies and launches a combine in Chinese heroin. As they drink to "the last days of capitalism" the play ends.

This successful and devastating satire has constant variety of incident, bravura and pace.

Magnificence. 1973. M.

In an interesting and original political play three high-spirited young men and two women decide to attract attention to the plight of the homeless by squatting in an empty house. Veronica is liberal, the others rather vague anarchists, while Cliff argues that they should have enlisted the support of the neighbourhood. Their leader is Jed. There follows a struggle with a bailiff who evicts them and accidentally kicks a girl, causing a miscarriage, thus enraging Jed and sparking off a wish for revenge.

Act One is followed by Jed's remarkable speech describing how after nine months in prison he emerges as a Marxist Leninist.

In the second act "Babs", a Tory minister of the old school, is seen on the Cambridge Backs in an uneasy encounter with "Alice", a modern abrasive Tory, stigmatised by his predecessor as "a peculiarly English type of fascist". The assassination of Alice in his country home is chosen by Jed, released from prison, as his "magnificent" protest against the establishment. But the gelignite fails to go off. Alice cunningly tries to undermine Jed's confidence with hospitable drinks and a parade of humanism. Then the gelignite explodes accidentally and kills them both.

It is Cliff who speaks Jed's epitaph. What horrifies Cliff about the assassination is not the violence but the tragic waste of thought and effort that could have been diverted to rallying the workers for constructive political action.

Magnificence, like Brenton's earlier film script *Skin Flicker* explores "the question of individual terrorism". He has said that his emotional sympathy is with Jed's urge to "disrupt the spectacle" and expose the "obscene parade" of the privileged establishment who by their treacherous manipulation have corrupted humanist values. But it is Cliff's practical intelligence and grit that he endorses. To this end he combines naturalistic techniques as in the squatters' scene with the shock of surrealism.

Peter Brook (b. 1925). Director.

US (or ambiguously *U.S.*). 1966.

US is a collaboration between director, actors, designers, musicians, and writers in an attempt to confront the Vietnam war and to involve the audience.

Brook admits anti-American bias.

The First Act is a violent theatrical assault on apathy. Brook re-employs techniques from Weiss's *Marat-Sade* and alternates utmost stillness, as in the initial mime of a Buddhist self-immolation, with loud music and noise. In the hideous uproar and confusion of a bombing raid at the climax a giant war-effigy from the proscenium crashes across the stage. Shattering assault is succeeded in Act Two by a penetration in depth, its centre being a dialogue between a white man about to burn himself alive and a girl whose cold, detached criticism gradually gives way to a bitter indictment of English parochial indifference. In an ambiguous poetic finale an actor silently releases butterflies, one of which he burns.

This daring and controversial use of theatre directly to involve the emotion of the audience in confrontation with contemporary political tragedy may mark a new departure.

Albert Camus (1913–60).

It was the French existentialist philosopher and novelist, Camus, who first enunciated the concept of the Absurd, describing it as whatever in human experience is incompatible with man's desire for reason, justice, happiness, and purpose.

Like Sartre, Camus expressed his views through the traditional dramatic form, and the plays most familiar here were those written before he had moved on to a more humanistic philosophy.

Caligula. French publication 1945. P.

The Roman Emperor, Caligula, suddenly decides to act in accordance with the absurdity of the universe and by his violent and perverse crimes forces on the Senators his own recognition of the absurd meaninglessness of existence.

Cross Purposes. French publication 1945. P.

Man's futile desire for happiness is dramatised in the legend of the mother and daughter who murder for gain the visitor to their inn, only to discover they have killed the son of the house. They then commit suicide.

The Price of Justice. French production 1949.

Camus's play of ideas, which is historically based, had a belated production here in 1972. It is set in the Moscow of 1905, where a revolutionary group successfully plots the assassination of a Grand Duke. Its focus is a dialectic of the ethics of revolutionary violence, its involvement of the innocent and the hazards of the social consequences.

Although for today's taste the play appears too schematic, it is full of suspense and especially relevant to contemporary events.

Paddy Chayvesky (b. 1923).

The Latent Heterosexual. 1968.

This American play begins as a hilarious caricature of homosexuality and drug addiction as embodied in the outrageous poet, Morley. His novel has just earned him $72,000 and his accountant advises him to evade taxation by a token marriage and by turning himself into a Corporation.

The marriage, to an expensive prostitute, is a sensational success, but soon the Corporation usurps Morley's personal identity. Almost paralysed, he makes a frantic effort to liberate himself and can find his only resource in suicide.

The remorseless and impressive final scenes change the tone of the play and constitute a serious satire on the atrophy of the human personality by Big Business.

Giles Cooper (1918–66).

Everything in the Garden. 1962. P.

Cooper deftly uses sophisticated comedy for a sharp satire on the sacrifice of principle to money in an effeminate bourgeois society. Four bored middle-class wives become part-time employees in an exclusive brothel, while their complaisant husbands enjoy the tax-free profits. There is a sudden horrifying change of key when at a party a neighbour realises the position and the four men destroy this outsider in a kind of ritual murder.

In Cooper's second version the play returns rather shakily to the comic vein.

Happy Family. 1966. P.

Cooper's last play, outwardly a light, witty comedy, is an incisive assured satire on arrested development and snobbish exclusiveness.

For the well-to-do Mark and his two sisters nobody exists outside the family trio, and they employ their leisure with nursery games, jingles, and punishments. When the elder sister introduces a fiancé he at first serves as catalyst, but he also is retarded, a grocer's assistant posing as solicitor, a "nobody" to the sadistic Mark, who soon contrives that he shall be ousted from the family circle and the nursery prattle resumed.

The bizarre situation skilfully dramatises indifference to others and obsession with the clutter of the past that stifles natural growth.

It is illuminating to contrast Triana's use of the same family triangle.

Shelagh Delaney (b. 1939).

The young Salford girl attracted attention with *A Taste of Honey*, 1958 (M), and *The Lion in Love*, 1960 (M), her last play. The artless candour of their portrayal of seedy workers and drifters was then a novelty and they owed much to the revision and production by Joan Littlewood (*q.v.*). Only *A Taste of Honey* now retains any significance, its unconventional subject being the pregnancy of an adolescent expecting a black baby and befriended by a homosexual youth.

Nigel Dennis (b. 1912).

Dennis, also a novelist, is a satirist in the tradition of Voltaire. In a Shavian preface to his first two plays he uses arguments sometimes more sparkling than valid to attack his favourite targets—the doctrine of Original Sin and the assumptions of psychoanalysis (*see* J42). He urges that both undermine self-reliance and tend to delegate power over the mind to a hierarchy which may threaten personality.

Dennis adopts a Shavian dramatic style and his vigorous first acts have strikingly novel situations and witty dialogue. Then satire tends to divert interest from from the characters, holding up action and weakening structure, as in some of Shaw's later plays.

Cards of Identity. 1956.

The play was adapted from Dennis's novel. An Identity Club exploits psychological techniques to induce local people into accepting changed names, memories, and identities and then uses them as servants. Only in face of their Bank Manager do the victims re-discover themselves! Dennis infers that the basis of personality is memory, which the psychologist can so edit as to manipulate personality—a thesis not verified by any appeal to scientific evidence.

The Making of Moo. 1957.

A colonial civil servant has weakened the taboo on murder by unwittingly killing the river god. He invents the new religion of Moo, complete with mythology, ritual, and ethics. In this bold satire Dennis exposes similarities between the efficacy of pagan ritual sacrifice and the doctrine of Atonement. In his preface he suggests that to conform to a religious sect is to belong to an Identity Club.

August for the People. 1961. P.

A satire on the tameness of the public when admitted—at a fee—to a "stately home," lacks the pungency and inventiveness of Dennis's early work.

Marguerite Duras (b. 1914).

The French novelist and script-writer of the film *Hiroshima Mon Amour*, has a sensitive flair for dialogue and for exploring the ebb and flow of feeling. Her naturalistic plays move subtly towards their climax, often the agony of parting, as in the one-act *La Musica*, 1966 (P).

Days in the Trees. 1966.

The theme of the play, virtually a trio, is the love–hate relationship between mother (Peggy Ashcroft) and son. She had indulged her own emotions by conniving at his playing truant for "whole days in the trees," so that he is now incapable of love for anyone else. Finally, the ageing woman admits to herself his callous egoism and misery, as now a gambler and pimp he lives contemptuously with the devoted girl for whom he procures.

The Lovers of Viorne. 1971.

Marguerite Duras returns to the subject of an earlier play, *The Viaduct*—an actual murder committed in provincial France in the 1940s when a married woman killed her husband and disposed of the corpse by dropping dismembered portions from a viaduct on to passing trains.

Apart from changing the identity of the victim to a deaf-mute cousin, housekeeper to the couple, Duras keeps closely to the facts and concentrates on penetrating the motive.

This demanding play is almost exclusively verbal and spare in design. After a loudspeaker announcement of the discovered crime an impersonal "Interrogator" probes the husband about the twenty-year barren marriage and in Act II he questions the wife herself, Claire Lannes (Peggy Ashcroft), apathetic yet deeply suffering.

He elicits complementary pictures of their meaningless existence, devoid of emotion or thought, the husband finding a cold response to his early love, the wife obsessed by thoughts of the former lover who had destroyed her religious faith, exasperated by the stifling house and revolted by her cousin's cooking.

Duras has spoken of "their totally asphyxiated life" saying, "the silence between them has to be destroyed."

It is significant that the victim is the deaf and dumb cousin.

Suzanna Andler. 1971.

For many years Suzanna (Eileen Atkins) has brought her children to the same rented house for the summer but now she contemplates change.

In the off-season an agent shows her over a larger empty villa, again in St. Tropez. She worries about the expense but gradually deep levels of anxiety are disclosed. Married for seventeen years Suzanna had long accepted the infidelities of the wealthy husband who still cares for her, but recently she has agreed to a brief affaire with Michel, a rough and struggling journalist, which involves her in new emotional conflicts. Confused as if in a dream she struggles with that paralysis of will that often accompanies suffering, as she strives to come to terms with her tenderness for her husband and the need she and her aggressive lover now feel for each other although they have little else in common.

This sensitive play reveals with faithful naturalism the loneliness and anguish of indecision. As literature and vocally it is exquisite. Theatrically it is less successful for apart from brief meetings with the agent and a confidante and a long telephone conversation with her husband, Suzanna's indecisive encounter with Michel provides the only external action. A radio production with Vivien Merchant as Suzanna indicated that radio is the play's ideal medium.

Friedrich Dürrenmatt (b. 1921)

The German-Swiss Dürrenmatt acknowledges the Greek dramatists, Shakespeare, and Swift as major influences. He describes his work as "theatre of paradox," revealing "precisely the paradoxical effects of strict logic." He is an unsparing critic of contemporary society, whose dangerous tendencies he exposes in striking and bizarre fictions, reminiscent of the later Shaw.

The Marriage of Mr. Mississippi. 1959.

An extravaganza poses the opposition between two principles carried to their logical and farcical extreme. One is a passion for the law of Moses, interpreted as retributive justice. The other is pure Marxism. The two characters

embodying these principles, together with a Quixotic lover, are manipulated and destroyed by an unscrupulous politician.

The Visit.

An old multi-millionairess revisits her birthplace and offers the inhabitants £1,000,000 to murder her former lover, who had denied her paternity order. Gradually persuading themselves that they are acting justly they comply.

Dürrenmatt cleverly maintains suspense in his withering satire on love of money, hypocrisy, and the sycophancy of press and radio.

The Physicists. 1963.

Dürrenmatt has said that this arresting play is not so much about the hydrogen bomb as about society itself and the impossibility of escaping the consequences of one's thinking.

The central character, attempting to suppress scientific discoveries that may lead to the hydrogen bomb, retires to a private asylum pretending to be in contact with King Solomon. There he is first in danger of two spies, pretending to the delusion that they are Einstein and Newton, and eventually of the mad proprietress whose use of his discoveries will lead to the destruction of the human race.

The Meteor. 1966.

Another play of paradox has as hero a man who wishes to die but cannot.

Schwitter (Patrick Magee), famous dramatist and Nobel prizewinner, already proclaimed dead in hospital, returns to the garret of his youth to die. In vain. As the old egoist swaggers, drinks, makes love, one by one those who touch his orbit meet their death.

The symbolism is unclear. Is Schwitter the egoistic kind of artist who feeds on the lives of others? The most effective incident—his dialogue with an ancient tart—cynically suggests that his art also has been prostitution, for he too has supplied artificial emotion to meet public demand.

The chief weakness of the play is that the surprise wears thin. An original idea adequate to a one-act play has been inflated too far.

Charles Dyer.

Dyer's first success was *The Rattle of a Simple Man.*

The Staircase. 1966. P.

One of the frankest plays concerning homosexuality is a dialogue between the middle-aged Charles Dyer (Scofield) and Harry C. Leeds (Magee) during a wretched Sunday night in their poky barber's shop in Brixton, the cage they have co-habited for twenty years.

Charlie is sardonic, aggressive, cruel; Harry, "a messy talker" is softer, protective. Their endless squabbling in ribald argot, comic, and searing, vents their exacerbated irritation, but underneath is glimpsed the pain of social isolation, the mother fixation, the frustrated hankering for offspring, the fear of exposure.

T. S. Eliot (1888–1965). *See also* Section M.

In his attempt to revive poetic drama the distinguished poet, T. S. Eliot, was moved by deeply religious and social aims, modestly regarding his work as experimental, "that of the first generation only." The verse he evolved was of a flowing poetic rhythm, "close to contemporary speech" and based on natural stress. Normally he used a line with three stresses and varying length.

In his two plays of the 'thirties Eliot had adopted the ritualistic themes and patterns of Greek drama and had achieved a certain tragic intensity. But the *Cocktail Party* inaugurated a new style, the theme still being Christian redemption and the plot deriving from Greek drama, but the idiom, that of the fashionable comedy of manners. In spite of subtle organisation the liaison has been an uneasy one.

It is curious that the creator of Prufrock should seem unable fully to animate his dramatis personae. This is partly because their inspiration is literary, partly because they are used to illustrate Anglican doctrine and to convey a message. Nor do they belong to the impeccable background against which they are so carefully placed.

The wealth and subtlety of reference of these plays and the beauty of the language make them a delight to the reader, but they are less compelling on the stage.

The Cocktail Party. 1949. F.

This play, revived in 1968, has its literary origin in Euripides' tragi-comedy *Alcestis*, the demi-god Hercules being replaced by Reilly, the psychiatrist, whose intervention breaks the back of the play, for it is not easy to sympathise with people who let their actions be so directed.

The Confidential Clerk. 1953.

Described as "high farce," this play derives from another tragi-comedy of Euripides, the *Ion*, whose theme of parents seeking their lost children reappears in Terence, Plautus, and Shakespeare.

The Elder Statesman. 1955.

Eliot here returns to a tragedy, the *Oedipus at Colonus* of Sophocles, but the youthful peccadilloes of Lord Claverton appear pallid compared with the patricide and incest of Sophocles' protagonist.

Jules Feiffer.

Feiffer, the New York strip-cartoonist of international fame, now writes plays.

Little Murders. 1967.

The blustering Newquist family of New York embody what Feiffer has called the "national paranoia" in face of "random violence," and when the daughter, Patsy, introduces her fiancé, Alfred, who is so strong that he never retaliates, they are incredulous. But Patsy is killed by some stray bullet, Alfred adopts the Newquist ethos, and the family is happily united sniping down harmless passers by.

The main theme is clear. "Man hates war but is fascinated by it. . . . Peace is a Sissy." The play began as a novel, which may account for the plethora of other stimulating ideas which are never fully integrated, and also for some highly entertaining satirical vignettes not entirely relevant.

God Bless. 1968.

This Shavian satire scintillates with dramatic and verbal paradox, epigram, and ironic understatement, and improves on reading.

It is timed in "the immediate future," with America waging war in three continents, and is set in the library of the Liberal Brackman (Dotrice), America's "oldest elder statesman."

On his 110th birthday he is cynically dictating the record of his shilly-shallying career, used by Feiffer as an image of the American Liberal compromise as a betrayal of principle, a "sell-out." His narrative is punctuated by teletype and television presentations of mounting insurrection off-stage. Then two heavily armed agitators, for Peace and Civil Rights, formerly Brackman's Harvard students, enter, soon to be followed by the President himself.

As forty-six cities go up in flames, the President reveals that the agitators have actually been financed by him as a tactic to shake up Congress! But the "tactic has gotten out of hand" and while Civil War breaks out the four men settle down to effect yet another compromise. The revolutionaries insist on bombing ten cities, but the President is to decide which ten!

The play operates as an urgent warning.

Max Frisch (b. 1911).

Frisch, a German-Swiss who has been influenced by Shaw and Brecht, dramatises current issues in ingenious, apt, and witty parables that have a lucid economy of outline.

The Fire-Raisers. 1961. M.

A delightful Absurdist satire on bourgeois self-delusion and ineptitude shows Biedermann

(Alfred Marks) persuading himself that he can cajole the incendiaries about to set fire to his house by inviting them to a good dinner. The situation is analogous to that of Benes of Czechoslovakia who included communists in his government, and to that of the Germans who connived at Hitler.

Andorra. 1964. M.

An incisive and moving satire on the vicious pervasiveness of antisemitism shows the Andorrans' betrayal of the lad Andri, reputedly a Jewish foundling, to the invading totalitarian state. Andri is in fact a Gentile and his assumption of Jewish traits is an example of identity imposed from without by society.

Christopher Fry (b. 1907).

Fry, widely acclaimed in the 'forties for bringing verse back to the stage, has written comedies and religious plays, the latter culminating in *A Sleep of Prisoners*, 1951, commissioned for enactment in churches during the Festival of Britain.

Fry devises ingenious situations, often in terms of poetic fable, informed by implicit affirmation and hope, lightly and gaily conveyed. His special talent is the creation of a dramatic atmosphere, unique to each play. But like *Love's Labours Lost* they tend to be too static and are carried by the dynamic and magic of verse. His delightful early verse was sometimes too lavish and discursive and with *Curtmantle* he began to use a plainer style with brief, telling images.

His maturer work completes the quartet of the Seasons that had begun with the Spring comedy, *The Lady's Not for Burning*, 1948, O.U.P., and *Venus Observed*, 1950, O.U.P., an unusual and felicitous comedy of Autumn.

The Dark is Light Enough. 1954.

In a play of Winter an eccentric and saint-like old Countess (Edith Evans) gives asylum to men of both sides in the Hungarian rising of 1948. The theme of non-intervention is presented with an elegance that saves it from didacticism.

Curtmantle. 1962.

A vigorous play has as tragic protagonist Henry II, shown as an imperious autocrat, brilliant, generous, and headstrong. Redeeming England from anarchy by his firm foundation of Common Law, he yet makes the tragic error of promoting as Archbishop his tried friend, Becket, who then proves intransigent and inconsistent and triumphs by his martyrdom.

With remarkable skill Fry incorporates the truly tragic hero and emotional power of the Aristotelian play (*q.v.*) in a work modern in structure. The main themes interpenetrate: the progressive discovery of Henry's contradictory personality in his relations with Becket, his people, and the wife and sons who deserted him, and the "interplay of different laws." The drama moves swiftly through the years 1158–89, the events successfully telescoped as in William Marshall's memory.

Some prose is appropriately used and the poetry is disciplined and vivid.

A Yard of Sun. 1970.

It is July 1946 in Siena, time of the first post-war Palio, that tense horse-race, which is also a "galvanic liturgy of life." In war's aftermath two neighbouring families strive towards renewal.

In one there are still brothers' conflicts to be resolved. Angelino's eldest son, the rebellious Roberto, ex-Partisan, now a devoted doctor, is scathingly scornful of easy-going Luigi, failed politician and Blackshirt, and also of the long-missing Edmondo, who suddenly turns up. A war-profiteer, Edmondo is smugly eager to use his financial expertise to contrive the families' fortunes.

Unwillingly Roberto is stirred by Edmondo's dazzling wife, embodiment of the passionate excitement of the Palio. But her husband's machinations go comically awry and they soon depart.

Roberto now realises that he loves the simple Grazia, daughter of the neighbour Giosetta, whose putative husband has just returned from a concentration camp, and now believes in his duty to return to his legal invalid wife. There is a hint of union between Giosetta and Angelino.

Although the scheme of this quiet, humorous comedy is somewhat too neat and flat it is true to its theme of resurgence. The fruits of Autumn may come. The poetic imagery well expresses the differing personalities and the volatile Italian temperament.

Athol Fugard (b. 1932).

Fugard, an Afrikaner, has now emerged as one of the most remarkable playwrights writing in English.

He left the University of Cape Town before completing his degree in Philosophy and spent two years as a seaman in the Far East, subsequently working in Europe. Economic circumstances obliged him to direct and act in his own plays and he had his own theatre group in Port Elizabeth, but he has now given up acting and hopes soon to devote himself entirely to writing.

As a liberal Fugard is in a most difficult situation. His roots and source of inspiration are in his Afrikaans kinship and his over-riding drive is to reveal to South Africans the "social circumstances that do terrible things to people," *apartheid* being one of these circumstances. He depicts them with unsparing realism and while constantly facing the risk of police interference and taboo he has tried "to be as courageous as possible . . . in indicting a social system", his aim being "to get plays performed not banned". Although the social implications of his plays seem inescapable, they do reach the stage in South Africa, for they are not committed to political criticism. Indeed they rise above it and perhaps it is the tensions that inhibit emotional self-indulgence that give to his work its characteristic fusion of passionate caring and disciplined objectivity.

A dominant theme is the human courage that survives appalling odds, a courage especially evident in women such as Milly, Lena and Hester. He is especially skilful in his handling of confrontation between two people who are closely involved emotionally, some complete plays being limited to a cast of two. The playwright Fugard most admires is Samuel Beckett.

In about 1963 seven men from New Brighton, the black ghetto in Port Elizabeth asked his help in starting an amateur drama group, which became the precursor of several other groups of black actors, who, because of *apartheid* can play to black audiences only. The Serpent Players presented works of Brecht, Genet, Strindberg, Sophocles and Euripides and became the seed-bed of a remarkable partnership in creative writing between Fugard and the black South Africans John Kani and Winston Ntshona. Their *Sizwe Bansi* and *The Island* when brought to England in 1973–4 were enthusiastically received.

The Blood Knot. 1966. P.

Of two brothers belonging to the mixed race of "Cape Coloureds," one "tries for white." The dialogue between them, both comic and naïve, and fraught with intense love and hate, is a microcosm of the terrible strains imposed by racial segregation.

People Are Living There. 1970. O.U.P.

In a shabby Johannesburg kitchen, the slatternly landlady, Milly, just deserted by her lover, frenziedly tries to whip up a party for her fiftieth birthday. The only guests are her lodgers, a "retarded poor white," and a student immersed in Sartre's anguish.

They get down to the grim "rock bottom" of mutual self-knowledge, of society's indifference to poverty, of the loss of joy in the aging process, measured by the frail chiming of a shaky clock. Only Milly's outburst of laughter at the ridiculous spectacle of the whole animal world saves their precarious companionship.

This compassionate play recalls Sartre's *In Camera* but has a more valid conclusion than Sartre's dictum, "hell is other people."

Boesman and Lena. 1971.

Uprooted from their shanty town near Port Elizabeth, the aging coloured couple, Boesman and Lena, can find no other refuge than a succession of rubbish dumps.

"We're whiteman's rubbish," exclaims Boesman. "He can't get rid of his rubbish. He throws it away, we pick it up. Wear it. Sleep in it. Eat it. We're made of it now. His rubbish is people."

When they encounter an old and dying Kaffir, Boesman adopts the bullying tone of the *baas*, but Lena tries to befriend him only to find that he speaks an obscure dialect and they cannot communicate.

In spite of inhuman conditions, Lena, like Milly in *People are Living There* somehow preserves some courage and resilience.

In an authentic film version Fugard himself takes the part of Boesman.

Hello and Goodbye. 1973.

The scene is the slum home of the Smits, poor whites in Port Elizabeth.

Hester, now on the streets, returns unexpectedly to search for and claim from her brother Johnny her share of the compensation paid to their father, who having lost a leg in an industrial accident was also crippled by resentment and self-pity. Tough and forceful she obliges her neurotic brother to fetch from the father's bedroom all the cardboard boxes which when searched disclose nothing but the ugly and worthless cast-offs from their squalid past. These like the furniture in Miller's *The Price* focus the emotional strain between the two; Johnny having given up personal ambition to act as nurse has identified himself with the invalid father, Hester with the mother, the patient bread-winner.

Eventually Hester is shocked to find the bedroom empty for Johnny had deliberately hidden from her the fact that the father had died. Suddenly moved, she asks Johnny to come away with her. But he, a victim of agoraphobia, symbolically takes his father's crutches and adopts his defeated pose.

As in *The Blood Knot* Fugard skilfully used a taut dualogue to reveal the pain of conflict between siblings but this later play lacks the wider resonance of the social suffering endemic in *apartheid*.

Sizwe Bansi is Dead. 1973.

Sizwe is a triumph of collaboration, both dramatic and racial, between Fugard and two members of the black Serpent Players, John Kani and Winston Ntshona, who are also the only actors. The piece is rooted in the personal experience of these two men, given shape by the literary talent of Fugard, and it creates a wonderful illusion of spontaneous dramatic interchange, story-telling and mime. Kani and Ntshona, who appear professionally for the first time, give a dazzling performance. They play the three characters while incidental figures are brilliantly conjured up by lightning impersonations. The action is continuous, the simple set being quickly adaptable to change of locale.

Initially it is the one room "Photographic Studio" of Styles (Kani). In a richly humorous monologue he recalls the day when the anxious bosses at the Ford plant, where he once worked for six years, ordered frenzied and long overdue cleaning and safety precautions in hasty preparation for an unexpected visit by Ford himself. They had called on Styles to translate their exhortations to the workers and their injunctions to "Smile", and he re-enacts with relish his highly individual interpretation and mimics their fawning reaction to Ford's three-minute entry.

Now proudly independent in his studio Styles confides his desire to take photographs that will confirm the black man's dream of self-respect and give him a symbol of permanent identity.

Robert timidly enters for a photograph to send his wife. Styles gives him confidence posing him with a cigarette in one hand and a fancy pipe in the other, and as the flashbulb goes for a second snapshot there is a blackout and a flashback to Robert's past, when Kani now takes on the part of Buntu.

Robert's real name in Sizwe Bansi. A bewildered countryman, he has walked from his famished village to Port Elizabeth in search of work and has been picked up in a police raid, but is too simple to realise that his Passbook is now stamped with an order to return home. Buntu befriends him and eventually gets across the harsh complications of the Pass Laws. Then Buntu stumbles over the corpse of one Robert Zwelima, and urges the reluctant Sizwe for the sake of his starving family to adopt Robert's Passbook with its work permit. He rehearses Sizwe in his new role by improvising possibly risky encounters and drilling into his mind the new identity number. "Burn that into your head, my friend . . . It's more important than your name." Buntu wishes him luck as long as he "stay out of trouble." "Impossible, Buntu. Our skin is trouble."

But Sizwe agrees to try and the play closes as again in the "Studio" he jauntily responds to Styles' encouragement, "Now smile Robert . . . Smile . . . Smile . . ."

An enthralling play brings home the massive hypocrisy and ruthlessness of a regime that would mutilate and reduce manhood to an identity number and a set of finger prints. Yet the work is devoid of self-pity and has none of that stridency which sometimes mars the British play of protest. In their warmth and generosity, their creativity and sense of humour, the black people find the rueful courage to survive and beyond courage evince even a rare "gaiety transfiguring all that dread."

The Island. 1973.

Like *Sizwe Bansi* the play was devised by Fugard and the two actors Kani and Ntshona.

The setting is a prison recalling the notorious Robben Island to which some members of the Serpent Players had been relegated. The two prisoners are locked by their isolation into a symbiotic relationship which they describe as a "marriage", hating each other as they toil digging and carting sand, comforting each other huddled in their cell. When John learns that his ten years' sentence has been reduced and he will be free in three months, Winston at first joyfully hugs him but then is overcome by jealousy.

But John urges Winston to go forward with the rehearsal for a prison concert of their version of *Antigone*, and notwithstanding Winston's pathetic drag, their performance gives a universal significance to their incarceration.

Statements After an Arrest Under the Immorality Act. 1974.

In 1957 the Queen gave royal assent to an Act prohibiting any sexual relationship between white and coloured or black people living in South Africa (even those legally married). The Act's effects are the theme of a brief ninety-minute play, which opens with a scene of lyrical tenderness between a coloured schoolmaster (Ben Kingsley) and his white mistress (Yvonne Bryceland). Gradually it appears that the man is suffering the common torment of one pulled between love for his mistress and responsibility for his wife and family, who he fears will discover his unfaithfulness. The lovers' private joy and anguish is rudely interrupted. Starkly illuminated by the flashbulbs of police cameras they seek panic-stricken to cover their nakedness with shabby blankets, but are given no opportunity to dress before being interrogated by the dispassionate police officer (Wilson Dunster).

Jean Genet (b. 1910).

The French Genet, abandoned as a child, has lived as social outcast and criminal and, while politically "uncommitted," has mirrored his bitter repudiation of society in plays of frightening impact.

His dramatis personae have been the rejected, murderers (*Deathwatch* (F)), despised servants (*The Maids* (F)), prostitutes (*The Balcony* (F)), Negroes (*The Blacks* (F)), and Algerian peasants (*The Screens*). These have realised their fantasies of sex, power, violence, and revenge only by com-

pulsive ritual acts, so that sequences of arresting ceremonial, sometimes Absurdist, replace character study and coherent plot.

In his destructive scorn of contemporary society, his recourse to rituals of violence, and his incantatory language, Genet satisfies the requirements of Artaud's Theatre of Cruelty.

The Maids. 1956. F.

Two sisters, maids to a fine lady, continually take it in turn to enact the rôle of mistress and maid so that each can vent her envy and rancour on the mistress. When their plot to murder the mistress misfires, one of them herself drinks the poisoned cup of tea.

Their compulsive charade, designed originally for a cast of young men, mirrors the obsessive and self-destroying conflict of envious love and hate in the mind of the outsider.

Triana's *The Criminals* has a similar theme and technique.

The Balcony. 1957. F.

This censored play had its world première at the Arts Theatre Club. It opens in a brothel, where the frequenters enact their fantasies of power by dressing up as bishop, judge, or general, until after an abortive revolution they are called upon by the Court to impersonate these authorities in actuality. Eventually the defeated revolutionary leader visits the brothel to enact the part of Chief of Police, who is then satisfied that his image also has been established in popular regard. The film gives a softened version of the play.

The Screens. 1973.

A rather sprawling play to be acted against movable screens with a cast of ninety-seven and lasting five hours was with Genet's permission presented in three hours with a cast of nine, the adaptor being Howard Brenton (*q.v.*).

Written in 1961 it differs from Genet's previous plays in representing his views on a specific issue, the French-Algerian conflict of 1954–62 and attacks colonialism as represented by decadent exploiters and cruel, sexually perverted soldiers. But the revolution of the wretched Algerian peasants is focused on yet another of Genet's rejected outcasts, the treacherous criminal Saïd, driven by his mother "to go to extremes" and so impoverished that he can marry only the ugliest girl.

There is an uneasy juxtaposition of political incidents with obsessive fantasies of sex and power, and the play is less concentrated and effective than earlier work.

Maxim Gorky (1868–1936)

Enemies. 1971. M.

Although the delayed British première of *The Lower Depths* influenced Neo-Realism (*q.v.*) Gorky's later plays, concerned with the Russian class struggle are unfortunately little known here. The première of *Enemies*, written the year after the 1905 uprising, was therefore doubly welcome, as, in Bryden's words, it is "the missing link between Chekhov and the Russian Revolution."

Workers in the Bardins' factory, next to their peaceful country estate, are demanding the dismissal of a harsh foreman, and Bardin, a gentle liberal, reluctantly agrees that his reactionary partner, Skrobotov, shall enforce a lock-out. In the ensuing dispute the latter is shot and carried back dead. The excellent first act is followed by the identification and trial of the murderer.

While Gorky's sympathies are with the oppressed, he is not doctrinaire and depicts with Chekhovian detail the complicated personal and political tensions among the leisured gentry and their consternation that liberal concessions carry no weight with the embittered workers, now "enemies".

Günter Grass (b. 1927).

Grass, a notable German novelist and author of some early absurdist plays, has recently written propaganda for the Social Democratic Party of Federal Germany.

The Plebians Rehearse the Uprising. 1968.

Produced here first by amateurs in 1968, and then by the R.S.C. in 1970, *The Plebians* is set in a theatre in East Berlin. The date, 17 June 1953, is that of the spontaneous yet formidable rising of the workers in East Germany against the Ulbricht régime.

The play—not a documentary—imagines a situation in which the Boss, clearly a counterpart of Brecht the dramatist-producer, is rehearsing his Germanised version of *Coriolanus*, whose protagonist is the aristocrat, who, spurning the rebellious plebians, all but betrays his country.

Into the Boss's theatre intrude rebellious workers, asking him to write a manifesto which will give coherence to their inarticulate demands. But the dramatist who has indefatigably urged intelligent revolution, scorns their amateur incompetence. Despite the advice of his wife, he temporises, exploiting the workers' gestures and tape-recording their dialogue as material for his own play.

Finally, moved by the enthusiasm of a girl, herself inspired by Katrin in Brecht's *Mother Courage* (*q.v.*), the Boss resolves to support the uprising. But already the Russian tanks are moving in. Bitterly he realises that he has himself played the part of Coriolanus.

The play reflects not only Grass's disquiet about Brecht's rôle in a satellite dictatorship. It concerns the predicament of the modern artist—that of Grass himself—as to whether art or political commitment should take precedence. A significant minor incident in the play is that the response of the University to the workers' cry, "Intellectuals, Solidarity," is merely to bar their windows. Grass clearly indicates that the lack of effective support of artists and intellectuals to the revolution they advocate results in a tragic cleavage in the nation—hence the sub-title *A German Tragedy.*

David Halliwell.

Little Malcolm and His Struggle Against the Eunuchs. 1965. F.

A deliciously funny send-up of the angry young man cult is located in a Huddersfield garret. Here Malcolm, a beatnik ex-art student, compensates for his inadequacies—professional and sexual—by fantasies of Hitlerian power. He imposes on his three chums his farrago of "Dynamic Insurrection," which so distorts reality that they all finally beat up the nice girl who wants to help Malcolm.

The sources of disaffection and violence are scrutinised incisively but with sympathy.

K. D. Dufford. 1969. F.

Dufford, like Malcolm, a fantasy-ridden mediocrity, commits child-murder in order to hit the headlines. Too much interest is diverted from his fantasy to conflicting interpretations of his crime.

Christopher Hampton (b. 1946).

When Did You Last See My Mother? 1960. F.

Hampton frankly explores the predicament of the adolescent Ian, a bitterly alienated homosexual, in his triangular relationship with a former school friend, Jimmy, and with Jimmy's mother.

Total Eclipse. 1968. F.

The story of Verlaine's passionate infatuation for the younger poet Rimbaud (prototype of Brecht's Baal) is dispassionately and convincingly presented, almost like a chronicle, the opening and closing scenes being particularly skilful.

The Philanthropist. 1970. F.

An ingenious comedy, ironic parallel of Molière's *The Misanthropist* (M), is "set in the near future" in the room of a bachelor don, Philip, the "philanthropist."

In an arresting *coup de théâtre* an aspiring dramatist, trying to convince Philip and his

friend Donald of the likelihood of his protagonist's suicide, unfortunately blows out his own brains.

Shortly afterwards a dinner party for six occasions some brilliantly precise and apt repartee. As in Molière, the characters are boldly delineated and effectively contrasted. Philip, a literal-minded philology don, disclaims critical judgment, but is fascinated by words in isolation, his lonely pastime devising anagrams. So anxious is he to please that he is terrified of hurting people, but his mumbling evasions give more offence than Don's trenchant criticisms.

The evening culminates in comic fiasco. Philip, too imperceptive to realise that his fiancée, Celia, wants to stay, lets her be "taken home" by an unscrupulous acquaintance, and out of pique she sleeps with him. Meanwhile Philip is too timid to refuse the nymphomaniac, Araminta, who stays the night "under conditions too appalling to relate."

Next day, Celia, having discovered Araminta at breakfast, returns again to break off her engagement with one too weak to control her. Philip, crestfallen, decides to approach Liz, only to find that she has spent the night with Don!

Harking back to Scene 1, Philip transposes "Imagine the theatre as real" into "I hate thee, sterile anagram." Then, taking a cigarette and a small pistol, he goes to join Don and Liz. Is this ambiguous finale a token suicide, Philip having previously given up smoking for fear of cancer, or does the anagram indicate a new fruitful involvement in life?

The significance of this "bourgeois comedy" is further appreciated by comparison with Molière's comedy of manners.

A common theme is the foibles of the age, in Molière courtly hypocrisy, in Hampton growing indifference to violence. Don's hilarious report of the news that an unhinged Tory disguised as a woman has mown down half the Cabinet is discussed with cool nonchalance. Only Philip is appalled.

Hampton's characters are of the same metal as their prototypes but the coin is reversed. The idealistic misanthropist, Alceste, rebukes flatterers, even his beloved, the coquettish Célimène, finally deciding to withdraw from society. The gentle Philip is in his privileged vocation already withdrawn, but lacking the courage of his own "lack of convictions," diffidently condones even the "frivolous" Celia.

But Hampton's focus has shifted from a man's passion for a woman to friendship between two men.

The play is too derivative to be entirely self-subsistent but Hampton skilfully incorporates a subjective penetration of Philip's complex nature into his meticulously structured comedy.

Savages. 1973. F.

A play which is informed by an icy indignation, is grounded in topical political events and in Hampton's personal experience. After reading how the Indians of the upper Amazon were being progressively exterminated so that the potential wealth of their land might be developed by commercial speculators, Hampton visited Brazil to investigate for himself and he has set his play in the Brazil of 1970–1, when during a brief revolutionary movement foreign diplomats of four different countries were kidnapped.

Hampton invents a fifth, the British diplomat Alan West (Scofield), who has a cultured interest in collecting Indian legends which he translates into English verse. West is seized by urban guerrillas who are revolting against a brutal fascist military dictatorship in cahoots with American speculators, and a series of scenes between West and his captor Carlos form the framework of the play.

Handcuffed to a bed the sceptical liberal diplomat is confronted by an enthusiastic and friendly Marxist and their sophisticated and ironic dialogue reveals their growing personal sympathy and the ideology that divides them—Carlos's dedication to action and West's stance as humane observer. The kidnapping is in fact the diplomat's first close contact with Brazil, for hitherto he has thought only in a way which is "distanced and disassociated", typical, considers Hampton, of the English people.

To Carlos obsessed by the massive squalor of a country where wealth is owned by three per cent of the people, the plight of the Indians is a "marginal problem" but West has been made aware of their systematic extermination by violent murder and by such gifts as poisoned food or blankets infected with smallpox, and interspersed with discussion in the hideout are film-style flashbacks demonstrating the Indians' predicament.

Some are reminiscences of West's encounters; as with an anthropologist friend who cannot expose the blatant corruption even of officials in the Protection Service, for that would be journalism, and with a complacent American missionary "pursuing a policy of integration". Within his barbed-wire settlement he busily instils a "work ethic tied to a reward system" extinguishing the Indians' happy indigenous culture and reducing them to a handful of "cowed and dejected" beings, "painfully timid and ingratiating".

Other flashbacks are like documentary film, one depicting the infamous hunting party of 1963, whose simple expedient in acquiring land was the mass murder of the villagers and firing of their homes.

Less successful are scenes of West's poetic soliloquies on the myths and dramatisation of Indian ceremonies. Scattered through the play and difficult to stage, they lack the impressive cumulative effect achieved in Shaffer's *Royal Hunt of the Sun* and there is an uneasy discrepancy between their emotive impact and the sophisticated dialogues.

The climax of the play is Carlos's reluctant shooting of West followed by a scene of the ruthless bombing raid exterminating a whole tribe during their ritual fertility ceremony.

The ambiguous title, indicating that the savages are the "civilised" exploiters, is balanced by a neat sardonic conclusion contrasting public concern at West's assassination with indifference to mass genocide.

David Hare (b. 1947).

Hare is one of our younger experimental fringe writers and has on occasion collaborated with Brenton (*q.v.*).

Slag. 1970.

Hare claims that his play set out "to show what was good about women" but admits that it ends up "as rather a vicious slur on them."

The cast is a trio of women. Ann, a headmistress, and her two assistants agree to forego sex as they attempt to run a girls' school where they may develop better ideals for society than those evolved by men.

Huddled together in a bizarre limbo insulated from real life, each one is cocooned by her social conditioning and personal prejudices. They squabble and play practical jokes on each other, the chief butt being Joanne, who ceaselessly spouts left-wing dogma, while Elsie knits baby clothes and almost persuades herself into a hysterical pregnancy. Not unnaturally this feminist St. Trinian's soon loses all eight pupils.

The play has little depth of perspective or structure, relying on amusing parody, sometimes facetious in tone, of girls' schools, women's lib. and political jargon.

What Happened to Blake. 1970.

A pantomime-style dramatisation of William Blake's career distorts the quality of his life.

The Great Exhibition. 1972.

Like *Slag* the play deals with self-isolated members of the middle class.

Hammett (David Warner) once a reasonably energetic Labour M.P. can now find no motive for action. He has stopped going to the Commons and his constituency and stays in the flat brooding on the meaninglessness and futility of his life.

His wife Maud had hoped to realise in their marriage the contact with reality that she misses in her work for the theatre. Disillusioned she entertains her Australian boy friend Jerry, an ex-banker who has opted out and together they smoke pot. Eventually she leaves Hammett and

in a desperate resort to action he exposes himself on Wimbledon Common but makes little impression on anyone save, ironically, his wife's best friend.

Hare is evidentally aware of the personal misery of existential despair that may haunt the affluent but this is overlaid by some amusing farcical comedy and random satire.

Michael Hastings (b. 1938).

Hastings' *Don't Destroy Me* was produced when he was 18. *Yes and After* (P) appeared in 1957.

The Silence of Lee Harvey Oswald. 1966. P.

The play, an example of "living theatre," begins with a straightforward narrative of the assassination of Kennedy, illustrated by film sequences and stills.

Then verbatim passages from the official interrogation briskly alternate with imaginative reconstructions of Oswald's domestic life—a technique which diffuses the sense of authenticity.

Rolf Hochhuth (b. 1931).

Hochhuth, like his predecessor Schiller, is specially interested in the historical play, using poetic licence to organise and adapt factual material to his own dramatic purpose.

The Representative. 1963. M. P.

Using some dramatis personae who represent historical personages, this play in verse exposes the failure of Pope Pius XII, Christ's "representative," to protest against the massacre of the Jews. Film sequences of the horrors of Auschwitz are used with harrowing effect.

Soldiers. 1968.

Hochhuth's inordinately long play had its genesis in his horror and protest at the bombing of non-combatants. It is set symbolically at Coventry Cathedral but contains a realistic play-within-the-play, the only part produced in 1968 and here discussed.

This is timed for the crucial months, May to July, 1943, and historical persons are assigned fictional parts. Hochhuth embodies his theme by presenting Cherwell as the "eminence grise" who advocates to Churchill (John Colicos), the commanding protagonist, a policy of ruthless saturation bombing. The theme is counterpointed by the suggestion that success in modern warfare demands not only barbarity but treachery. This is given personal urgency in Churchill's confrontation with his ally, the Polish General Sikorski, whose intransigent hostility to Russia was proving a threat to our precarious alliance with Stalin.

Hochhuth's sensational insinuation that Churchill connived at Sikorski's death is a striking and poignant dramatic image and is defended by some critics on the grounds that a play is an agreed fiction. Hochhuth himself, however, claims to have seen secret evidence and has by some been sharply criticised for traducing Churchill when he cannot produce this.

In the final Act, Bishop Bell is presented in a fictional impassioned protest to Churchill against civilian atrocities, but the arguments assigned to him do not unfortunately proceed to their logical conclusion that modern warfare is *per se* an atrocity and here the moral pressure of the play is dissipated.

Hochhuth boldly handles his dominant themes while organising the intricate political detail in a gripping and enthralling way. The presentation of historical characters is remarkably convincing and Churchill emerges as an idiosyncratic, massive, and tragic hero, fully aware of his moral dilemmas and ironically prescient of his rôle as the servant of history in winning a war that destroyed the balance of Europe.

Donald Howarth.

A Lily in Little India. 1965. P.

Two households are revealed simultaneously. Alvin nagged by his promiscuous mother finds some confidence in growing a lily bulb. This brings him into touch with Anna, an older spinsterish girl keeping house for her widowed father and eagerly corresponding with Maurice, her seaman brother. The hesitant friendship between Alvin and Anna is indicated with some charm and distinction.

Three Months Gone. 1970.

In a sequel Anna now orphaned is pregnant after a single sexual encounter with Alvin and tries to keep him at a distance. But the delicacy of their relationship is here swamped by extraneous incidents many of them phantasy involving the presence on stage of the virile Maurice and his encounter with Alvin's mother.

Eugene Ionesco (b. 1912).

Ionesco, one of the leading Parisian playwrights of the Absurd, differs from Camus and Sartre in that he expresses his conviction of life's absurdity, not rationally, but through images that are in themselves absurd.

In 1948, while learning English from a primer, Ionesco stumbled on his vocation, his shocked reaction to the platitudes he was memorising being dramatised in *The Bald Prima Donna.* Here he singled out aspects of contemporary life which remain as the chief targets of his ridicule.

One is the empty, myopic existence of the petit bourgeois, his lack of passion and thought, the yielding to conventional pressures, the urge to conform. Another is the desiccation of language which, stereotyped and inadequate, has become "nothing but clichés, empty formulas and slogans."

Ionesco's sense of life's absurdity has deep roots, for he is keenly aware of the anguish of the modern world, of the flight from reason, both tragic and absurd in its potentialities. He believes that by dramatising his own inner hurt he can best reveal a universal experience. In *The Shepherd's Chameleon* he has plainly stated that for him "the theatre is the projection on to the stage of the dark world within," the world of dream, anguish, dark desires, inner contradictions, and obsessions.

It follows naturally that he is little preoccupied with specific social problems. Regarding the human condition as wider and deeper than the social condition, he dislikes any kind of political message or conformism and deliberately repudiates the "committed" and didactic play.

Iconoclastic in both his principles and technique, Ionesco—as he indicated in *Victims of Duty*—has challenged most dramatic assumptions, including realism, the concept of the "Aristotelian play," consistent characterisation, motivation, plot, and the distinction between tragedy and comedy.

Discarding so much, Ionesco has evolved a new technique of shock tactic, using most ingenious theatrical devices to express his convictions. He attempts "to go right down to the very basis of the grotesque, the realm of caricature . . . to push everything to paroxysm, to the point where the sources of the tragic lie. To create a theatre of violence—violently comic, violently tragic."

In his plays, as in those of Pinter, the traditional dividing lines between tragedy and comedy melt away, for his amusing images are at the same time poignant, expressing as they do human disappointment and folly, so that his hilarious comedy may have a tragic import.

A characteristic technique is the use of proliferating material objects, which externalise the anxieties of his characters—an accumulation of chairs or eggs, for instance, or an expanding corpse. He hopes thus "to make the stage settings speak; to translate action into visual terms; to project visible images of fear, regret, remorse, alienation."

The discarding of proved theatrical techniques is risky. Shock tactics are successful only as long as they surprise by their novelty. It is a measure of Ionesco's talent that he continues to invent the novel and arresting.

In two of his most recent plays, *Rhinoceros* and *Exit the King*, the nihilism for which Ionesco has been criticised has been relieved by the assertion of the human value of fortitude.

Ionesco's plays were introduced into England in the 'fifties and they have had a marked and specific impact on English drama, especially on Simpson and Saunders. Although Pinter has a philosophy

and style all his own, his early work is based on similar presuppositions.

The Bald Prima Donna. Written 1948.

Characters from an English language manual come to life and pour out their clichés in a " parody of a play," which Ionesco first considered to be a " tragedy of language," but whi chproved theatrically very funny. The first dialogue between husband and wife is now a classic.

Thus Ionesco, almost by accident, wrote the first of many satirical exposures of the sterile language of those who live a merely mechanical existence.

The Lesson. Written 1950. P.

A nervous old professor coaches an eager young girl. Elaborately " proving " the impossibility of communicating by words, he arbitrarily decides what various words shall mean, until he rapidly gains assurance and eventually rapes and murders his pupil, the fortieth that day.

Ionesco illustrates the prostitution of language as a means to power, the sexual element in power, and the sadism lurking in the teacher–pupil relationship and indeed in all authority.

Jack. Written 1950.

Urged by his conventional family to settle down to married life, the Bohemian son, Jack, resists Roberte, the proposed bride, because having only two noses she is not ugly enough. He eventually succumbs to Roberte II with three noses. Ionesco parodies submission to bourgeois conformity.

The Chairs. Written 1951. P.

An ancient concierge and his wife prepare for a crowd of guests who are to hear his final message to posterity. As the totally invisible guests arrive the couple fetch more and more chairs for them, until, with the entry of the professional orator who is to pronounce the message, they jump into the sea. But the orator is deaf and dumb and his writing on the blackboard is a meaningless jumble.

The empty chairs constitute a most effective theatrical image for man's failure to communicate, and the dumb orator makes the record of a lifetime seem utterly futile. It may also suggest how meaningless can be the words of author and actor. Ionesco says, " The theme of the play is nothingness made concrete."

Victims of Duty. Written 1952.

By transforming a detective into a psychoanalyst, Ionesco argues that there is little difference between the psychological drama and the mere detective play.

Amédée. Written 1953. P.

A corpse in the flat of a married couple, constantly growing at a frightening rate, is a gruesome and appropriate image of their dead love.

Rhinoceros. Written 1958. P.

More and more rhinoceroses appear in a small provincial town. They are the inhabitants who, one after the other, want to be turned into these thick-skinned, aggressive animals. Finally only Bérenger (Olivier) resists the urge to conform.

The terrifying lure of conformity is here skilfully and movingly illustrated.

Exit the King. Written 1963.

In an agnostic counterpart of the 15th-century *Everyman*, Ionesco shows King Bérenger (Alec Guinness), in his disintegrating palace, reluctantly submitting to the process of dying, his final resource being fortitude alone. This dramatic elegy, inspired by the final scenes of Richard II, is designed with bold simplicity, presenting man's mortal dissolution with unflinching honesty and a tenderness new in Ionesco.

Alfred Jarry (1873–1907).

Ubu Roi. 1966. M.

In 1896, Jarry, initiator of the " Pataphysics " movement, scandalised Paris with his startling *Ubu Roi*, precursor of Absurd drama.

The characters appear as grotesque puppets, shocking and comic. The shameless, greedy Ubu caricatures both Macbeth and bourgeois vulgarity and in his brutal conquest of Poland becomes a monstrous prototype of ruthless cruelty.

Ann Jellicoe (b 1928).

Ann Jellicoe's initial work as producer has left its mark on her plays.

Discounting the concept of man as a rational creature and stressing that people are driven by emotions she concentrated in her early plays on people in a highly emotional and irrational condition. She deliberately tried to stir up in the audience the emotions portrayed on stage, employing violent stimuli—a barrage of visual action, rhythm, sound, and sheer noise. Words were reduced to a minimum and these few frequently incantatory and meaningless. Ann Jellicoe wanted the audience to yield unthinkingly to the emotional impact and to refrain from asking, " What does this mean? "

While these plays were often intense and exciting, they were severely limited in range and manner and to some degree obscurantist. The emotional is only one aspect of human experience, and it is inextricably entangled with intellectual experience which is just as valid. To dwell almost exclusively on the irrational to the neglect of coherent speech—man's hard-won tool of thought—is partial and misleading.

The function of the artistic image is so to reveal aspects of experience that they can be recognised and harmonised, and to elucidate the significance of the image intelligence is necessary.

In later work Ann Jellicoe appears to have discarded her theories.

The Sport of My Mad Mother. 1957. F.

A gang of Teddy boys, living in terror of another gang which never appears, is dominated by the fierce and enigmatic Greta. Exulting in their feelings of violence, they express themselves in inarticulate and disjointed words and phrases, staccato cries and incantatory songs. Flim, a commentator, emphasises these with a set of instruments, including a motor-horn, which makes sounds that are often discordant and a-rhythmic.

All this makes a receptive audience aware of what it may feel like to belong to an adolescent gang, but Greta is not easy to accept. A mother–schoolmistress figure, she finally gives birth to a child and is an embodiment of the Indian goddess, Kali. The epigraph of the play is " All creation is the sport of my Mad Mother, Kali." Ann Jellicoe explained that the play is based on myth and uses ritual, bodying forth " fear and rage at being rejected from the womb or tribe." Such symbolism demanding an interpretation of its significance is out of key with a play so deliberately " anti-intellect " and restricted to a direct emotional impact.

The Knack. 1961. F.

The knack in question is that of getting girls and three out of the four characters are frankly exposed in the irrational grip of sex. The inhibited Colin struggles with the over-experienced Tolen for the possession of Nancy (Rita Tushingham) and again the action is carried forward as much by improvisation as by coherent speech. The film version captures the play's spirit.

Shelley. 1965.

A lucid, well-documented chronicle play illustrates incidents in Shelley's life. But the simple straight-line structure is not suited to the complexity of poetic genius. The personality that emerges is that of the selfless social idealist and pamphleteer and the theme his theory of free love, involving Harriet and Mary in disaster. The predicament is viewed from the woman's angle

and the initial germinal situation, that with Harriet, is so oversimplified as to be false.

The frequent change of brief scenes, effective in themselves, has a fragmented effect.

The Giveaway. 1969.

A would-be satire on commercial "free gift" competitions (and television stardom) is too painfully obvious and flimsy to carry any weight.

James Joyce (1882–1941). *See also* **Section M.**

Exiles.

Joyce's only play, rejected by both Yeats and Shaw, was after some vicissitudes of production, wonderfully justified under Pinter's direction in 1970.

Its theme is the agony of mind and spirit engendered by a courageous attempt to live beyond the confines of law, convention, and habit. Richard Rowan returns to Dublin, a famous writer, after nine years' voluntary exile. He brings Bertha, his wife by common-law, who had devotedly left Ireland with him, and their little son, Archie.

Rowan again meets Beatrice, who has always loved him and with whom he has for years corresponded voluminously about his work. From complex motives, partly to assure himself that Bertha's union with him is still absolutely free of conventional ties, he encourages her growing intimacy with his old friend and disciple, Robert. But Bertha, who in her simplicity is envious of Beatrice's education and subtlety of mind, feels rejected and confused, Robert that he is acting in an underhand way, and Richard that he must be ever wounded by doubt as to their fidelity.

Only parental feeling for Archie and Bertha's profound tenderness for Richard save them. For Bertha, with "something wiser than wisdom in her heart," has an intuitive insight beyond Richard's probing manipulating intelligence. Since Richard is to some degree a self-portrait, Joyce's objective self-criticism is remarkable.

This taut and close-knit play in "three cat and mouse acts," where the past "is present here now," recalls Ibsen.

In its complexity of viewpoint and entanglement of personalities there is ample material for four plays such as Hopkins' television sequence, *Talking to a Stranger*, 1966 (P).

Heiner Kipphardt.

In the Matter of J. Robert Oppenheimer. 1966. M.

The play, already performed in 23 capitals, concerns Oppenheimer, "father of the A bomb." The source is documentary, the 3,000 pages of proceedings before the Personnel Security Board of the US Atomic Energy Commission in 1954.

A hearing taking over a month with 40 witnesses has been condensed and shaped so that evidence is represented by only 6 witnesses. Kipphardt's aim was to follow Hegel in stripping away the adventitious circumstances so that the essential situation clearly emerges. He has made a few additions, such as monologues and final statements, and all deviations from the literal documents are based on historical data.

The play therefore has an extraordinary authenticity and grip while the central dilemmas are lucidly presented. As *The New Scientist* pointed out, it is for the audience to answer the searching questions raised. Was Oppenheimer, with his communist connections, a security risk? Can a scientist work with state authorities and keep his integrity? Is he responsible for the use made of his discoveries?

Arthur L. Kopit (b. 1938).

Oh Dad, Poor Dad. 1961.

This play parodies the devouring American "Mom," who emasculates all her menfolk. She travels accompanied by her husband's corpse in a coffin and dresses and treats her son of 17 as a child. A gruesome Freudian fantasy is presented as a comic "tragifarce," but there is little latent content.

Indians. 1968.

The career of Buffalo Bill Cody exemplifies the sweeping theme of America's encroachment on the Redskins. It is focused in the spectacular device of Cody's famous Wild West Show, where imprisoned Indian Chiefs had been specially released to re-enact their former resistance. Cody, at the climax, faced by the accusing ghosts of Red Indians, voices America's compunction at their virtual extermination.

Bernard Kops (b. 1928).

Kops, who was born in Stepney, of Jewish working folk, left school at the age of thirteen.

His plays include *The Hamlet of Stepney Green*, 1958 (P), *Good-bye World*, 1959, *Change for the Angel*, 1960, *The Dream of Peter Mann*, 1960 (P), the one-act, *Stray Cats and Empty Bottles*, and *Enter Solly Gold*, 1962, chosen for performance in the provinces by Centre 42.

Kops is less successful with realism than with fantasy, enlivened with the gaiety of local colour and frequent Jewish folk-song.

Most of his plays are variations on a basic design—that of the idealistic dreamer-hero, with an uneasy relationship with his easy-going mother, who in some cases is courted by a suitor whom he dislikes. Eventually the hero realises that a devoted girl is his true mate. Kops' plays thus draw nourishment from a deep emotional source, that of the Oedipus–Hamlet myth, on to which he grafts the happy ending of the fairy tale.

Social criticism, especially of mass-produced goods is often a secondary theme.

D. H. Lawrence (1885–1930). *See also* **Section M.**

It is remarkable that the plays of Lawrence should have had to wait half a century before coming to the stage.

In 1965, at the Royal Court, Peter Gill directed Lawrence's first play, *A Collier's Friday Night* (P), written in 1906. He followed it in 1967 with *The Daughter-in-Law* (P) and in 1968 he restaged these two, together with *The Widowing of Mrs. Holroyd* (P) in a special Lawrence season acclaimed by the critics.

These plays, written before the First World War, depict Lawrence's Nottinghamshire mining community with faithful realism. The themes are the universals already familiar through the contemporary *Sons and Lovers*—sex antagonism, the wife who feels "superior" to her miner husband, her possessiveness of the gifted son and jealousy of his wife or sweetheart.

Events of hearth and home, with profound emotional implications, move forward with a leisurely naturalism that is undisturbed by a forced plot and that seems extraordinarily modern in its idiom.

Henry Livings (b. 1929)

The protagonist of Livings' frank and realistic comedies of working life is normally the little man, whose unforeseen reactions culminate in hilarious disaster which topples down the petty rulers. Farce and near fantasy are lightly used to suggest a plea for the disregarded people who support the social edifice.

Stop It, Whoever You Are. 1960. P.

The insignificant Perkin Warbeck, a lavatory attendant in a factory, is involved in a series of ludicrous mishaps, but indirectly gets his own back on his harsh and frigid wife and his mean, pompous landlord. The comedy, which is very funny indeed, culminates in a fantasy-like scene of Warbeck's death, a séance, and a gas explosion.

Big Soft Nellie or the Sacred Nit.

A farcical comedy has as protagonist a mother's boy who is the laughing stock of his mates.

Nil Carborundum. 1962. P.

The scene is the kitchen of an R.A.F. station and the action culminates in a riotously-funny mock commando raid, which exposes both the pilfering cook and service routines that are now an anachronism.

Eh? 1964. M.

In an ultra-modern factory the incompetent young boiler-man, Val (David Warner), brings his bride to sleep in the bottom bunk and gives most of his attention to growing giant mushrooms, and eventually blows the place to smithereens. Again a light-hearted farcical comedy shows the underdog confounding established authority. Incidently a fool's lapse starts the "mushroom cloud."

Honour and Offer. 1969. M.

The pompous lodger and mortgagee, Cash secretly desires his "delicious" landlady and hates her needy and unscrupulous husband, a slick travelling salesman, who eventually fools him.

Robert Lowell (b. 1917). *See also* Section M.

The first dramatic work of the distinguished American poet, Robert Lowell, is *The Old Glory*, a recent trilogy of plays in free verse based on stories of Hawthorne and Melville. Their unifying motif is the flag.

Benito Cereno. 1967.

The third and best play of Lowell's trilogy is based on a short story by Herman Melville, which had its origin in actual incident.

About the year 1800, while off Trinidad, Delano, Captain of an American trader, observes that a Spanish trader, the *San Domingo*, is in great difficulties and generously goes to her aid.

Captained ostensibly by Benito Cereno, the *San Domingo* is in fact in the hands of her cargo of revolted slaves who have spared his life only that he may navigate them back to Africa. The effete and exhausted Cereno lives at the knife point at the hands of Babu, the wily and insinuating Negro who is in actual command.

Delano fails to realise this, for Cereno dare not speak plainly, and the American is too opaque and self-assured to interpret ironic hints. Only when Babu openly defies him is he enlightened, but too late. The only safe course now left to him is open violence and without warning his seamen massacre all the Negroes.

In a final ominous incident the last survivor, Babu, cries out "The future is with us" before Delano empties his pistol into the Negro's body, crying, "This is your future."

This is one of the most truly poetic plays to be seen in London for many years, lucid in verse, rich in themes and suggestive power, austere in design, while the theatrical poetry of mimes, rituals, and masques is used with ironic significance. The Director, Jonathan Miller, envisaged it as a kind of inverted *Tempest*, the Spanish ship a black magic island and Cereno a drugged Prospero held captive by Babu, and he produced it in the formal and stylised manner of opera.

The play is also remarkable in its relevance to America's dilemma, domestic and foreign, including her ambiguous attitude to the contemporary Negro. Jonathan Miller points out that Lowell here shows "the penalties of uninformed generosity" and of the trilogy as a whole he says, "These plays are about the big-hearted blindness of the American nation and they show quite clearly how the country's cardinal virtues can . . . harden into the very vices which so disable the American pursuit."

In a world increasingly threatened by discord between white and coloured peoples *Benito Cereno* has an even wider implication.

Prometheus Bound. 1971.

Lowell has adapted the first and only surviving play of Aeschylus's trilogy, where Prometheus, whose name means "forethought" and who had stolen fire from heaven for the benefit of mankind, is manacled to a crag at the command of a vengeful and violent Zeus.

Lowell's adaptation is in some ways more decorated than the original, in others more spare, the chorus of Ocean Nymphs being reduced to three Sea Birds.

Jonathan Miller's simple, stylised production helped to emphasise the tragic significance for today of an archetypal myth—the situation of one who refuses to collaborate or compromise with arbitary dictatorship and is consigned to solitary imprisonment and torture.

John McGrath (b. 1935).

Of Irish extraction, McGrath, who had wide experience in the army before reading English at Oxford, has now had several plays published.

His early realistic plays were critical of some aspects of society and recently McGrath has become a thoroughly committed writer, identifying himself with the 7.84 Theatre Company, one of the leading so-called "fringe" groups. This radical socialist company, which presents plays in the small theatre, factory and pub, is so named because 7% of the people in the country own 84% of the wealth. McGrath shares the company's convictions that the underprivileged mass of the people are exploited not only economically but culturally since advertising and the mass media distort their sense of values and erode their self-respect. In plays such as *Plugged In* he has also tried new techniques in his attempts to make the audience aware of exploitation and confident of working-class values while providing genuinely lively entertainment, both moving and comic.

Events while Guarding the Bofors Gun. 1966. M.

In situation, McGrath's masculine and disciplined play is a realistic counterpart of Giles Cooper's radio fantasy *Mathry Beacon*.

The futility of military routine is exposed with steely irony as, on a freezing night in Germany, during the Cold War, seven men guard the obsolete Bofors gun. The frustrating situation also engenders personal conflict. The uncontrollable desperado O'Rourke defies Lance Bombardier Evans. An insecure boy of 18, Evans is so obsessed by the hope that promotion may provide him a way of escape to England that he connives at insubordination. Finally O'Rourke's reckless suicide destroys them both.

Bakke's Night of Fame. 1968.

A play, faithfully based on the novel, *A Danish Gambit*, by William Butler, takes as subject the prisoner's last night in the condemned cell of an American prison.

Bakke, condemned for an apparently motiveless murder, enjoys being as provocative as possible, discomforting the well-meaning guard by first requesting then contemptuously rejecting the traditional routine of food and consolation. He entangles the priest with his contention that society is exercising not justice but revenge, his only constant demand being that he shall meet his "buddy," the executioner.

This granted, Bakke so needles and infuriates the executioner that the man is betrayed into a violent outburst, gloating over his imminent task. Bakke, gleeful and triumphant, has proved his point about revenge.

McGrath shows great ingenuity and expertise in manoeuvre and sudden surprise, but he has not quite achieved the tension and suspense nor the progression of the *Bofors Gun*. The significant encounter with the executioner comes too late and is treated too briefly.

Plugged In. 1972.

The theme of three original one-act plays is the massive indifference of monopoly capitalism to individual human need. Free from didacticism they work indirectly, played in a cartoon-like setting of giant contemporary objects such as a Daz packet, symbolic of mass production, an Ionesco-like absurdity which in the first two plays is reflected in the dramatic situation. Both of these derive power from the association of the latent violence inherent in capitalism and engendered by it with loveless sexuality, repression and licence.

Angel of the Morning, a serio-comic play, is set in a working home. Lodwick's wife is frigid, his daughter promiscuous. "A wife you don't fancy and won't leave and a daughter you do fancy and can't have," says Tralee, as she flirts with him one night. Briefly Lodwick is attracted and aroused

by her to a prospect of freedom and purpose only to learn that she and his daughter are fellow activists and that their accomplices are upstairs robbing him of his life savings, to invest in I.C.I., to finance the revolution.

In *Plugged In*, Kay, wife of a managing director, wearily sits on a street bench and obsessively recites disconnected newspaper reports of violence and disaster. She is joined by Derek, a sympathetic young working man who, preferring country walks, refuses to work more than one week in three.

He cannot stem her recital until his account of how in anger he had beaten his mistress excites Kay's own erotic masochistic feelings. Of her newspapers she cries, "I feel plugged in to history . . . taken over, crushed, by many many men . . . I need pain. It stops me suffering"; of her husband she says, "At night he drinks cocoa."

In this, the most powerful of the three plays, Kay is presented with psychological insight. Not only is her personality swamped by the mass media but she is sexually frustrated and repressed. In some ways she is a contemporary Lady Chatterley, now urban and demented.

The third play, *They're Knocking Down the Pie Shop*, is a realistic comedy with moments of pathos. The impending demolition of the excellent local pie shop to make room for a vast intercontinental hotel occasions a fierce quarrel in a welder's home between the ruthless go-getter son and his activist sister. The father, a kindly socialist, sadly admits himself disillusioned by the workers' failure to co-operate, and finally the tired mother enters hoping she may get a soft job in the hotel and bringing the last of the pork pies.

Frank Marcus.

The best-known plays are *The Killing of Sister George*, 1965, and *Mrs. Mouse Are You Within?*, 1968. Both give a humorously sympathetic account of an unusual human relationship, offset by boisterous comedy coming from off-stage.

David Mercer (b. 1928).

Since 1961 Mercer has written television plays and also the film-script *Morgan or a Suitable Case for Treatment*. His first stage play, *Ride a Cock Horse*, was produced in 1965. He is concerned with the psychological predicament of today's able, educated young man of artisan origin (a reflection of his own situation as son of a Yorkshire engine-driver). He usually depicts him as estranged from his parents, disorientated and childless.

Originally drawn to Marxism, Mercer has recently said that whatever the society he is examining, "whether the Vatican or the Kremlin," he is most concerned with the individual "who's catching the muck that's flying off the ideological fan," but he has not yet successfully dramatised this concern on the stage.

Belcher's Luck. 1966.

The rickety English class structure is the framework of a complex play.

On his ramshackle country estate, contemptuously served by his former batman, Belcher, Sir Gerald is becoming senile, Helen, his icy, avaricious niece, persuades Belcher to goad her uncle to his death so that they may together inherit the property. She then scornfully dismisses Belcher in favour of Victor, his bastard son.

Victor, expensively educated by Sir Gerald, is mentally unstable and impotent, but this familiar Mercer figure is now on the periphery. The conflict between the chaste and physically timid Sir Gerald and the coarse and drunken Belcher has become the compelling focus.

After Haggerty. 1970. M.

Bernard Link, dejected after two unsuccessful marriages, suddenly finds his new flat invaded by the vociferous American Claire, deserted wife of the former tenant Haggerty. She brings her baby. Idiosyncratic "decorators" from "Rely-On" add to the comic confusion.

Meanwhile rather stereotyped flashbacks in the form of monologue reveal emotional stalemate; Bernard, international drama critic, addresses his parochial engine-driver father (invisible to the audience); and the adoring heiress, Claire, talks to the indifferent and anarchical Haggerty (also unseen).

Bernard's weary embarrassment is intensified by the unheralded arrival of his father, prejudiced and censorious, yet pathetic.

The play ends with two acts of cruelty. An empty coffin arrives from Haggerty, indicating his demise, and Bernard, exasperated by his father's mental atrophy, symbolically hangs the funeral wreath round his neck.

A latent topic is disillusion with communism and violent protest, but Mercer's favourite theme, the alienation of artisan father and educated son, finds no resolution. The dialogue is vigorous and inventive, especially in invective.

Flint. 1970. M.

The play presents the improbable situation of a kindly septuagenarian Kensington vicar, Flint (Michael Hordern), agnostic since ordination, whose sexual obsessions and irregularities have long been the scandal of the diocese.

While conducting his latest affair in the vestry with the teen-age Dixie, a Liverpool Irish "scrubber" from Holloway gaol, already pregnant by another, Flint inadvertently sets the vestry on fire. Meanwhile his wife, hysterically crippled since her honeymoon, sets fire to the church. She is then murdered by her sister, formerly Flint's mistress, who promptly goes mad. Flint and Dixie escape abroad on his motor-bike and sidecar. While she is in labour by the roadside, he helplessly crashes into an ammunition lorry and is killed.

Mercer has claimed that Flint's "humanity is more valuable and more deserving of our love and compassion than the institution to which he belongs." But to contrast the hero, presented as endearing, with some stagey clerics is unconvincing demonstration. Recent revivals of Shaw make *Flint* look paltry as a "play of ideas," especially as the individuals who "catch the muck" are the vicar's hapless women!

There is melodrama in plenty and some lively farcical comedy, but wordy meditations, virtually monologues, clog the action, so that the play lacks the pace and invention of the sparkling Feydeau farces recently translated by Mortimer.

Arthur Miller (b. 1915).

Arthur Miller, an admirer of Ibsen, shares his strong sense of moral purpose and of the individual's responsibility to the community. This is balanced by a sympathetic understanding of the insecurity of the individual in modern society.

Miller's characters, deeply felt and realised, are fallible men who suffer through their own errors of character or judgment in social conditions which are incomprehensible, indifferent, or even hostile to them.

A recurrent pattern is that of paternal responsibility within a patriarchal family unit, and the father's distress as he sees his errors hurting wife and sons. But the sense of responsibility flows outwards to society as a whole, of which the family is but the growing point. Significantly—apart from the benign mother-figures—Miller's most balanced characters are lawyers.

His plays are well constructed, the dialogue economic and telling, and he has progressed from the realism of *All My Sons*, published 1947, to much freer experimental techniques, while the prose style has become more fluid and eloquent.

Death of a Salesman. Published 1949. P.

A compassionate and finely-balanced play exposes the impingement of hire-purchase commercialism on the ageing salesman, Willy Loman, a weak, foolish, and deeply affectionate man, and also reveals his overwhelming sense of guilt towards wife and sons. The play is worked out on two planes, the inexorable present and Willy's past which obsessively enacts itself within his mind. The film version with Frederic March is excellent.

The Crucible. Published 1953. P.

In 1949 Marion Starkey's *The Devil in Massa-*

chusetts dealt with a witch-hunt in Salem in 1692, and pointed out its relevance to our own age, also rent by "ideological intensities." In 1952 the activities of McCarthy gave it a special urgency.

In his powerful play Miller uses this historical incident to depict not an indifferent society but one in which positive evil is unleashed. The evils he explores are the persecution of a minority and the interference of the Establishment in the individual conscience.

Characteristically Miller focuses attention on the plain man, John Proctor, and he invents his former adultery with Abigail, so that the play is not a partisan manifesto but a study of the complex contradictions of actual life. The self-righteous fanaticism of the persecutors and Proctor's own growth in self-knowledge and courage are faithfully and poignantly portrayed.

A View From the Bridge. 1956. P.

Eddie Carbone, a Brooklyn docker, is so gripped by jealous possessiveness of his wife's niece, that he eventually betrays her two kinsmen, illegal immigrants, to the Authorities.

In a play of repressed sexual passion, with hints of incest and homosexuality, Miller shows mastery of a kind of situation new to him and the heightening tension is realised in taut and disciplined sequences.

A lawyer, Alfieri, acts as a Greek chorus but is powerless to intervene, for Eddie infringes something more primitive than the legal code and it is by the primitive vendetta that he is eventually killed.

Incident at Vichy. 1966. P.

Miller here turns to the responsibility of society for the individual in a play which exposes the latent racial hostility which even the best men may unconsciously harbour.

The example he takes is antisemitism, the place and time Vichy in 1942, the scene a bleak anteroom within sound of a railway, where sealed trucks are deporting Jews to the furnaces of Auschwitz. Here a group of men and a boy, Jewish suspects, await investigation. There is an atmosphere of chill horror and suspense as each tries to summon up his own pitiful defence against the premonition of the ghastly journey he must embark on, once he is summoned behind the closed door.

Eventually only two men remain, the two most aware and articulate, Doctor Leduc, a Jewish analyst (Anthony Quayle) and Von Berg (Alec Guinness), the only Gentile of the group, a cultured and humane Viennese Prince, who is horrified by the vulgarity and barbarism of the Nazis.

In their final dialogue Doctor Leduc convinces the Prince of his unconscious antisemitism and the Prince gives his safe-conduct to the doctor.

A subsidiary theme of the play is the way society imposes extrinsically an identity on the individual, in this instance, as in Frisch's *Andorra*, the rôle of victim on the Jewish people. Through Leduc, Miller also criticises the Jews' acceptance of their rôle.

This disturbing play makes the greatest demands on the emotions, intelligence and humanity of the audience, who like the Prince to some degree undergo psycho-analysis. But the play is also characterised by a fine restraint. As in Æschylus' *Agamemnon* the violence takes place behind closed doors, with the significant difference that in Miller's play the chorus and victims are identical.

The Price. 1969.

Two brothers confront each other in an attic crowded with the heavy furniture of their dead father, a financier ruined in the Depression. Its imminent sale is the occasion of their first encounter in sixteen years.

Victor Franz, who had given up a scientific career to support his father, is now a policeman at retiring age but too immobilised by his past to begin a new career in spite of the hysterical pressure of his wife. Walter, a surgeon, in his slick pursuit of success has had a prolonged breakdown and a broken marriage. The "price," ostensibly that of the furniture, is the price each has paid for his decision in life and its inexorable results.

The brothers ruthlessly dissect and probe back to the motivation of their choice. Walter is forced to admit calculated callousness but drives Victor to realise that his sense of social responsibility was also flawed, for he had sentimentally sacrificed his potentiality to a disingenuous father too cowardly to work again.

But no reconciliation ensues, Victor angrily refusing the dubious job which Walter offers as a salve to conscience.

Miller describes his play as stripped to the skeletal structure of two lives, the home the dead husk from which they had developed. But the characters are complex and through the Ibsen-like situation runs a thread of delightful and significant comedy. Solomon, an ancient Jew, survivor of wildly differing professions and four marriages, is the furniture appraisor and embodies the resilience lacking in the Franzes. When he falls he bounces. He shrewdly decides to buy all the furniture at a fair price and at curtain fall sits gleefully in the chair of the beaten father, chuckling exuberantly at his decision to begin life afresh.

The play is realistic, but the muted significance of various remnants of bric-a-brac is symbolic in effect. Organised with meticulous artistry, it is lucid and profound, and rich in the wisdom of experience distilled. Acted without a break it holds the audience absorbed.

John Mortimer (b. 1923).

Mortimer, a barrister, first won success with his short plays, such as *The Dock Brief*, 1957, and *Lunch Hour*, 1960 (M)., originally written for radio and television.

Here his talents are seen at their best, especially his gift for seizing on an unusual encounter between "the lonely, the neglected, the unsuccessful," whom he envisages in realistic settings of shabby gentility, and he is particularly sympathetic to those who allow their fantasy to overlap or swamp actuality.

But the moment of insight that gives pathos to his short plays is not enough to illuminate those of full length, like *What Shall We Tell Caroline?* and *The Wrong Side of the Park*, which lack substance.

Two Stars for Comfort (1960, M.) is also unsatisfactory. In its basic situation it is an inflated version of *Collect Your Hand Baggage* (M), with little beyond sentiment and pseudo Laurentian special pleading to fill the gaps.

The Judge. 1967. M.

After 40 years' absence from his native city, the bachelor Mr. Justice Chard returns for his last assize. He seems to expect some unspecified accusation about Serena's Bohemian establishment, but when the judge finally confronts Serena there he demands condemnation of himself.

It is revealed that as a youth he had once had relations with her knowing her to be a minor, had subsequently paid for an abortion and that his whole life had been slowly undermined by a rankling sense of crime and inconsistency. When Serena tells him that there was no occasion for an abortion and that she got the money from him to go abroad with her lover, the bewildered and frustrated Chard goes berserk.

The plot is thus an inversion of Dürrenmatt's *The Trial*. The commanding themes of guilt and the difficult and exhausting process of judging are boldly focused in the complex compulsive personality of Chard. Balancing the themes of guilt and retribution is that of permissiveness, represented by Serena. She is unfortunately pictured in a superficial way as a shallow Bohemian, and her ménage is not unlike that satirised by Mrozek in *Tango*, and much of the potential tension of the play is therefore slackened. Is the author too indulgent to his off-beat characters?

In the scenes with the judge Mortimer returns to the milieu of *The Dock Brief* and much of the attraction of the play is in his wry attitude, fascinated, tolerant, and amused, to the ceremonies and quiddities of the legal process.

A Journey Round My Father. 1970.

An autobiographical play is affectionately centred on Mortimer's own father, also a barrister. Blinded by a minor accident, Father became increasingly eccentric, his oddities often proving very disconcerting to his small, rather isolated family circle.

It is now apparent that Mortimer's own boyhood and schooldays and his father's idiosyncracies and fascination with the law have all helped to give substance to the earlier plays. Chard in *The Judge* especially shares with Father several mannerisms and also a liking for young people.

Slawomir Mrozek (b. 1930).

Mrozek, a Pole, who began as journalist and cartoonist, has recently established a reputation for satirical short stories and short plays.

Tango. 1966. P.

Mrozek's first full-length play is like a satirical cartoon, an expressionistic exposure of the cultural and political vicissitudes of 20th-century Europe as liberalism, fascism, and communism succeed one another.

A slovenly household of ageing Bohemians sentimentally cherish their memories of youthful rebellion against social convention when just to dance the tango was an act of defiance.

The son, Arthur, detesting their sloppy anarchy of taste and morals, enlists his reactionary great-uncle Eugene in his own counter-revolution to restore the *status quo*. But he soon resorts to fascist rant and force, terrorising the family until he is himself cut down by his own henchman, the tough lout, Eddie. The curtain falls as Eddie forces Eugene to partner him in a tango.

To an English audience especially the flatness of characterisation incidental to the cartoon style may be a little unsatisfying, but the novel satire is exhilarating.

Peter Nichols.

Nichols has long been interested in music-hall and revue and he expertly deploys their techniques of direct address to the audience. He successfully uses one of the dramatis personae as an ironical commentator able to step easily in and out of the action.

He has a remarkable talent for conveying with comedy and compassion the sharp pain that can underlie the absurdities of personal relationships and he is intelligently concerned with specific social problems.

A Day in the Death of Joe Egg. 1967. F.

Nichols has shown remarkable sensitivity and skill in developing his theme—the especial difficulties of monogamy when the only child, a ten-year-old girl, is hopelessly spastic. He uses comic techniques of revue as the parents re-enact their frustrating encounters with doctors and clergy. But below the jesting facade grows the realisation that the wife's compulsive maternity blinds her to her husband's needs and that his endurance is crumbling.

Nichols has a spastic child and says "It's a play about marriage. . . . Not autobiographical."

The National Health. 1969. F.

In a bleak men's ward in a decaying hospital the staff are reasonably competent but faceless. Interpolated are brief T.V. scenes of *Nurse Norton's Affair*, a burlesque of the rosy view of the medical profession as seen on popular T.V.

The vignettes of the consultant, the chaplain, and the visitor, have the pungency of revue. The male nurse acts as compère to the whole, and also as devil's advocate who maliciously destroys the beginning of a positive relationship between a neurotic but protective schoolmaster and the alcoholic he is helping.

The play has the sharp comedy associated not with impartial enquiry but with astringent criticism. It has been seen as an image of Britain's own condition.

Forget-me-not Lane. 1971. F.

With easy expertise Nichols presents psychological strain in terms of hilarious domestic and social comedy. He spans the generations deftly conveying the manners of each and presenting a recurring pattern of the marriage strained to breaking-point and the children caught in "the genetic trap" enacting in middle age the parental traits they most disliked.

As he moves in and out of the action Frank, now in his forties, is able to re-live crucial experiences and ruefully and sardonically to interpret them. His adolescent self (taken by a young actor) is seen in war-time Britain, the only child in a divided home, siding with his easy-going mother against the father, Charles, absurdly unsuccessful in all he attempts, whether as petty commercial traveller, martinet or entertainer. Frank's mind is on girls, but he is too repressed to respond to the frank overture of Ursula (later his wife) and takes refuge with pin-ups and fantasy.

Later Frank, sexually frustrated, faces the breakdown of his own marriage and to his dismay finds himself echoing his father's mannerisms. Too late he understands the pathetic Charles, also the son of incompatible parents, his awkward affection for his wife constantly rebuffed.

Eugene O'Neill (1888–1953).

Although O'Neill's work belongs to the first half of the century, three of his later works had their delayed première here in the 'fifties, two of them making a great impression.

Recognised as the greatest and most influential of American playwrights, O'Neill at his best came to close grips with the serious issues of human life, showing man battling with a harsh environment and with his own inner passions. He was deeply involved with his characters, often the flotsam and jetsam of humanity, conceived with disillusioned compassion, and he could create the powerful theatrical situation which rivets the audience. On the stage these gifts went far to compensate for a looseness of structure and a dialogue which is singularly flat, poor in vocabulary, and lacking in rhythm. His plays are better acted than read.

O'Neill, lacking the advantage of an American dramatic tradition, experimented with many European techniques before finding his own most personal style—a faithful realism with suggestive overtones of emotion and reflection.

British playwrights like Wesker and Alun Owen resemble O'Neill. They also are committed to individuals, especially to working people living insecurely. Like him they reveal the subtle and inhibiting ties that bind members of a family or gang, subjects which lend themselves to a similar rather sprawling and diffuse structure and dialect style. So far they have not matched O'Neill's passionate and gripping intensity.

The Iceman Cometh. Published 1947.

In a naturalistic play, whose prototype is Gorky's *The Lower Depths*, down-and-outs await the arrival of the dionysiac Hickey. But Hickey has just murdered his wife and his abortive attempt to rouse them from "pipe dreams" to reality leaves them sunk even more deeply than before in drink and self-deceit. The pessimistic theme is that of Ibsen's *The Wild Duck* and the situation that of Beckett's *Waiting for Godot*.

Long Day's Journey Into Night. Published 1955.

An avowed autobiographical play depicts O'Neill's family on the day when his mother (Gwen Ffrancgon Davies) relapses into drug addiction and Eugene learns that he must leave the doomed circle for a sanatorium. As it was there that he chose his vocation, this constitutes the one note of hope in a deeply mournful reverie. The Freudian love–hate relationships are unfolded with tender understanding.

Joe Orton (1933–67).

Orton was a successful commercial exponent of black comedy who also won praise from serious critics especially for his dialogue.

His range is narrow and he is preoccupied with crime, perverted sexuality, and violence portrayed without inhibition as hilariously comic, sometimes with satiric effect. The macabre plots give occasion for a flow of deadpan repartee, normally smutty, sometimes merely facetious, often very apt and funny indeed, always a parody of the would-be genteel. Nearly all Orton's characters speak alike and are as undifferentiated in their lingo as in their lack of morality.

The satire is in the form of caricature or parody and apart from its implications it is almost impossible to discover in Orton any expression of human value or aspiration. It is not always easy to discriminate between the unsavoury matter of his plays and the expertise and aplomb with which it is manipulated, and some feel that he defaces the image of life.

Entertaining Mr. Sloane. 1964. P.

The handsome young wastrel, Sloane, already a murderer, finds a cosy refuge with Kath. A slattern of forty, she smothers him with motherliness and, sexually insatiable, she seduces him from the first night. Her brother, Ed, a homosexual, soon employs Sloan as his "chauffeur." When Sloane tries to escape their possessiveness, his brutal murder of their father puts him into their power and they agree quite literally to share him, each having him for six months at a time.

The play scores by a skilfully handled plot, an ironic "poetic justice" and the sly and genteel euphemisms of the salacious dialogue, and it won the London Critics Variety Award as the best play of 1964.

Basically the plot is that of Pinter's *The Birthday Party.* In both cases a man on the run is sheltered by a slovenly older woman, but here Kath's sexuality vulgarises the situation and as she constantly refers to herself as Sloane's "mamma" and to their unborn child as his "brother" it is highly suggestive of incest. The kindly husband of Pinter's play has been replaced by the homosexual smart-Alec, Ed.

Loot. 1966. M. P.

Helped by his accomplice a young criminal secretes the loot from a burglary in his mother's coffin. This is the key situation in a macabre and complicated farce, which is also an exuberant caricature of funeral ritual, of a police which is represented as hamhanded and venal, and of cheap detective fiction. The characters are cardboard puppets manipulated by the plot and the play is notable for the fact that vice is completely triumphant.

Crimes of Passion. 1967. M.

A double bill consists of *The Ruffian on the Stair,* 1966, Orton's first play, and *The Erpingham Camp,* 1967. Frequent and fussy scene changes betray their origin in radio and television respectively.

The Ruffian on the Stair. 1967. M.

It is illuminating to see how Orton's first play, a grotesque and savage comedy, uses the plot but not the atmosphere of Pinter's first play, *The Room* (q.v.). Orton cuts any aura of mystery and makes all explicit. The occupants of the room are now Mike, a criminal living with an ex-prostitute, Joyce. The intruder is a boy ostensibly seeking revenge for his brother with whom he had lived in homosexual incest, and whom Mike had murdered. He is in fact seeking his own death and provokes Mike to murder him by pretending that he has seduced Joyce.

The Erpingham Camp. 1967. M.

A satire on holiday camps shows an uprising of the merrymakers who eventually kill Erpingham. The ebullient parody has some highly comic incidents.

It was first projected as a film script, a modern version of Euripides' *The Bacchae,* but was rejected by Lindsay Anderson. Euripides' great play with Freudian foresight shows Pentheus destroyed by revellers because he had repudiated the liberating worship of Dionysus. Orton's sketch completely lacks any such insight or complexity and Erpingham meets his fate simply because he is stupid and dictatorial.

What the Butler Saw. 1969. M.

A farce in a psychiatric clinic is typically Orton in its discrepancy between decorous speech and indecent behaviour, but pace and invention flag.

John Osborne (b. 1929).

Osborne is endowed with considerable theatrical talent and a torrential rhetoric, most effective in impetuous monologue and in hostile denunciation.

These gifts were at once apparent in *Look Back in Anger,* 1956, where the protagonist, Jimmy Porter, makes a strident attack on the assumptions and values of the middle class. The play was perfectly timed and its success immediate, for Jimmy voiced the pent-up frustrations of the radicals of his generation, baffled by the complacence of an establishment which had muddled through two wars and left them without any sense of security or direction. Morcover, the frisson of surprise at sight of Jimmy's shabby provincial attic delighted playgoers jaded by the convention of stage drawing-room.

Osborne had broken new ground and for some years went on to experiment, attempting in 1957 and 1961 Brechtian techniques and in 1962 those used by Toller and Genet. But his two plays of 1968 are conventional both in structure and in their plushy, affluent settings, while the heady tirade of invective has dwindled, as the characters spew out a bitter personal malaise in disconnected complaint; in *Time Present* an actress's supercilious gibes at family and acquaintance and in *The Hotel in Amsterdam* the impotent grousing of an escapist coterie.

West of Suez, 1971, written apparently in bold emulation of Chekhov again presents a privileged milieu, but is less undisciplined in style.

Osborne is most successful in the portrayal of his dominating and eloquent protagonists, like Archie Rice, Bill Maitland and Laurie. Even when disorganised by self-pity they always convince and even overwhelm us as we watch them driven on by sado-masochistic urges to destroy both themselves and their circle. A succession of famous actors, Olivier, Nicol Williamson and Scofield have brought them unforgettably to life. But the other dramatis personae, serving as audience, target, or "feed," are often presented perfunctorily and seem fabricated, distinguishable only by a few mannerisms and existing not in their own right but in the assertions of their fellows.

This kind of characterisation is damaging to structure. Dramatic confrontation is spasmodic and the sense of conflict and tension dissipated so that the shape of the play becomes slack. The exposition tends to be confused, clogged with comments on characters still in the wings, and the climax is sometimes arbitrarily imposed.

The highly individual tone that prevails in Osborne's work is a curious blend of distaste for the present and sentimental nostalgia for the past, especially for the era of England's imperial and colonial power. Originally voiced by the protagonist this mood has overcome the minor characters. A hostile rejection of all and sundry, an animosity to life as it is, finds expression in stinging repartee, and barbed innuendo, sometimes ironic, smart and amusing but so uniformly negative as to become monotonous if not downright dreary. It cannot rank as satire, which is based on positive concepts of what values should be realised in a good society and in the gay comedies of Molière or Shaw meticulously distinguishes between a current absurdity and potential good.

"There aren't any good, brave causes left," says Jimmy Porter. Neither here nor in any other play is there anything to suggest that Osborne does not endorse this destructive statement, one of the silliest of the century.

When will Osborne restore the balance by a play that is life-affirming and life-enhancing?

Look Back in Anger. 1956. F.

Jimmy Porter, product of "white-tile" university, has married Alison, a colonel's daughter and their misalliance triggers off his furious diatribe against her and her family. When she returns to

her parents because pregnant, her friend Helena promptly becomes Jimmy's mistress, until Alison, having lost her baby returns and is reduced to grovelling to Jimmy before they can resume their unstable relationship.

The play, with its fusion of sexual and social tension, made an immediate impact on Osborne's contemporaries. It cleverly synthesises a strident denunciation of Alison and of the privileged classes, so that Jimmy's marriage is like a token rape and plunder of the establishment, the excitement given a sensational fillip by his liaison with Helena.

Jimmy's torrential rhetoric is inebriating and the surprises well judged, but the surrounding characters are too compliant to be convincing. This dramatic defect and the author's ambivalent attitude to Jimmy himself, give a false authority to an immature and wantonly destructive protagonist.

The Entertainer. 1957. F.

Osborne here attempts to use the Brechtian device of " endistancing," employing a framework of music-hall scenes, where Archie Rice (Olivier), a seedy comedian, tries to hold the stage with tawdry patter and songs in a dubious show with nudes called " Rock'n Roll New'd Look." These are intended to " endistance " realistic scenes of Archie's shabby home. But the " endistancing " device serves little purpose for the overall mood of unquestioned disillusion " whooped up " by drink and patter is in both planes unrelieved. Querulous complaint that England has lost the glory and glamour of Edwardian days is crystallised on the realistic plane by the report of the death of Archie's son at Suez and in the music-hall by the presentation of a nude Britannia, wearing only her helmet.

Osborne turns to the music-hall because he claims it to be a folk art with an immediate, direct contact. The film version is good.

Luther. 1961. F.

Luther, based on a recent biography, is a less subjective work, although Osborne again takes for his hero a rebel, the son of an unsympathetic mother, and emphasises the emotional and not the intellectual sources of Luther's protests.

The play is imitative of Brecht's *Galileo* both in its loose " epic " structure and also in the attempt to present the protagonist in an equivocal light. The first two acts give a sympathetic and leisurely portrayal of Luther's early conflicts of conscience and vigorous attack on superstition while in the third act he is hurriedly presented as having treacherously let down the peasants who had been encouraged to rise against the Emperor. But the political reasons for Luther's dilemma are not even hinted at and we are invited not to think, as in *Galileo*, but to condemn while ignorant of relevant facts. Structurally this sudden *volte face* is most damaging to the play.

The most effective scenes, such as Tetzel's selling of indulgences and Martin's sermon at Wittenberg are splendid rhetoric, without a word of dialogue and directed straight at the audience.

Skilful period production and the acting of Albert Finney as Luther made the play theatrically effective.

Two Plays for England. 1962.

Two slight plays make a double bill.

The Blood of the Bambergs is a parody of a royal wedding. Monarchy is held up to ridicule along with its trappings of ceremonial and fulsome adulation by press and radio. The bridegroom having just been killed in his racing-car, an Australian press photographer is secretly passed off in his place. The final act is a film with an unctuous running commentary, the film device deriving from the German Expressionist theatre, where it was first used by Ernst Toller.

Under Plain Cover is intended as an attack on sensationalism in the press. The first part shows a pretty provincial couple dressing up in rôles symbolic of sex fantasy, their activities accompanied by a thin trickle of dialogue. In the second half dramatic presentation is abandoned in favour of a charade and commentary by a reporter who reveals that the couple were brother and sister, a feeble presentation of the compelling theme of incest. The first scene is a pallid imitation of the brothel scene in Genet's *The Balcony*, where the assuming of symbolic rôles has powerful sexual and political implications lacking in Osborne's play.

These sketches do not profess to offer convincing studies of character in action and unlike intelligent satire they do not imply positive standards nor use the mature techniques of irony and wit, but rely on parody and mimicry.

Inadmissible Evidence. 1964. F.

A play, which many have praised highly, has the ingredients of a commercial success. It provides the sensational spectacle of a middle-aged solicitor, Bill Maitland, obsessed with sex, and disintegrating under the influence of drink and drugs, and, thereby, such a rôle for the star actor (Nicol Williamson) as to constitute a stage *tour de force.*

The play opens with a dream sequence as Maitland is tried in the court of his own mind. What follows is his rancid outpouring of self-pity, as during forty-eight hours, he is progressively deserted by staff, clients, and mistress. Some of the minor characters are here reduced to unheard voices on the telephone and one actress serves to impersonate three faceless clients. Maitland's flagellation of himself and his circumstances is unrelieved and monotonous.

A Patriot for Me. 1965.

The protagonist of Osborne's best play, produced privately, is Redl, a distinguished army officer of the Austro-Hungarian Empire, who through his homosexuality is blackmailed into becoming a spy for Tsarist Russia.

Osborne is here finely objective and ironic. He uses a series of brief scenes with significant juxtaposition of characters and swift dialogue. The first act, showing Redl's gradual discovery of his nature, is extremely discriminating and adroit and the drag ball which opens Act Two is an astonishing *tour de force.*

Act Three shows a decline of tension as Redl, now a spy, himself declines, his fibre coarsened through a sequence of sordid infidelities by male lovers and prostitutes. His final unmasking and suicide is almost a foregone conclusion.

The play spans the years 1890–1913 and Osborne presents the ethos and atmosphere of the Imperial Army officer élite, undermined by espionage and treachery, in a vast and unforgettable panorama.

A Bond Honoured. 1966.

Osborne, in a free translation of *La Fianza Satisfecha*, is said to have distorted Lope de Vega's play and portrays yet another alienated, and narcissistic " hero."

Time Present. 1968. F.

The protagonist, Pamela, is a neurotic actress. Emotionally strangled by the familiar " Electra complex," an exaggerated devotion to her father, a once famous actor, now dying off-stage, she is unable to establish any satisfactory human relationship, in spite of love affairs and the friendship of the devoted Constance, a successful Labour M.P., in whose flat she is living.

Pamela's role is static and verbal; reiteration of her shallow scheme of values (a preference for style over vulgarity), sentimental reminiscences of her father and a relentless spate of contemptuous and indiscriminate derision. Phrased in modish argot some gibes have a bitter wit, especially pleasing to the prejudices of the illiberal.

A contrived plot is superimposed. The exposition is clumsy, the climax, Pamela's decision to have an abortion to end her pregnancy by Constance's own lover.

Pamela's alienation which should arouse compassion, becomes tiresome rather than moving, largely because of the play's apparent assumption that her outpourings have objective value and interest.

The Hotel in Amsterdam. 1968. F.

United by fear and dislike of their employer, a film magnate, cryptically referred to as K.L.,

three couples retreat to a luxury hotel in Amsterdam as a hide-out from his encroachments.

They pass the weekend in denouncing K.L., drinking, and exchanging desultory jokes and complaints about homosexuals, mothers, and "the working class," until the unwelcome arrival of a relative and the news that K.L. has killed himself disturb the tenuous camaraderie.

Such a structure is perfunctory. Only the garrulous and petulant Laurie (Scofield) is individualised and the characters reveal and discover little of value about themselves or each other.

An interesting sidelight is that Laurie fancies himself as an authority on "the creative process," boasting, "What I do, I get out of the air." Is this Osborne's method? Great creative geniuses give a very different account.

Since the play indicates no positive norm, it cannot be defended as satire. Some critics praised it highly for its sense of mood. Others found it tedious.

West of Suez. 1971. F.

In a sub-tropical island, formerly British, an expatriate couple entertain her family: her three sisters, two with husbands, and her father Wyatt, who, it is reiterated, has been a distinguished writer.

The prolonged opening sequence is in Osborne's best style. Frederica, the adroit sister and her pathologist husband, a "blood and shit man," parry the stinging innuendoes and calculated evasions of a sterile marriage, but the pathologist then virtually disappears from the play.

The other relatives and sundry acquaintance drift in and out, usually preceded by a leisurely dissection of their deficiencies.

The canvas is cluttered with supernumerary characters, but Wyatt himself, presented with unusual detachment, firmly holds the centre and provides a wonderful rôle for Ralph Richardson. Spoiled by success and now a television sage, he is a consummate poseur, self-indulgent and affectionate, effusively professing that consideration for others which he conspicuously lacks and absurdly and pathetically anxious for admiration.

He and his coterie are privileged but bored. Scornful of the new regime yet curiously uneasy, they chatter indolently, nostalgically harking back to memories of army officer life in India.

The play is without incident until violence suddenly intrudes in an ill-prepared melodramatic finale. First a hippie American student makes a violent verbal onslaught, all "blood and shit," and almost immediately armed islanders enter and gun Wyatt down.

Osborne evidently follows Chekhov in depicting a decaying and impotent group "perched between one civilisation and the next," but he fails to catch Chekhov's humanity and his portrayal of the live relationship between individuals which is poignantly expressed in their own acts.

A Sense of Detachment. 1972. F.

Five characters and their chairman stroll on to an almost bare stage and engage in desultory criticism of the audience, drama critics and the devices of the modern theatre. Audience participation is travestied by the carefully planned interjections of a correct gentleman in the stalls, who periodically stalks off to the bar, and of a rowdy football fan in a box, who has brought his own beer with him, their objections to the "non-play" forestalling those of the audience.

The only properties are a piano, film screen, barrel-organ and pulpit. Reading from a pornography catalogue is juxtaposed with seventeenth-century poetry, music with traffic noises, pre-war songs are sung, Bernadette Devlin and Paisley are mimicked, the Conga is danced and scraps of film shown. The bickering dialogue reflects Osborne's familiar prejudices, now to include technology and the Common Market.

If a burlesque of *avant garde* theatre is intended the piece is after Beckett sadly out of date.

Alexander Ostrovsky (1823–86).

The eminent Russian playwright is unfortunately little known in this country.

The Storm. 1966.

Written in 1859, Ostrovsky's fine realistic play portrays a social group unfamiliar to us, the petty tradesmen of an isolated township, who are avaricious, ignorant, and bigoted.

The widow, Kabanovna, is a warped and ruthless matriarch, who saps the vitality of her weak son and cruelly tyrannises over his hapless wife, Katerina. The lonely, susceptible girl yields to the love of a young stranger from Moscow. Then sheltering in a church during a violent storm, she is overcome by superstitious dread and remorse. She confesses and later kills herself.

This perceptive tragedy is that of young and sensitive people striving to escape the yoke of rigid elders, but in the last resort succumbing to the harsh creed by which they have been indoctrinated.

Alun Owen (b. 1926).

Of Welsh stock but with an Irish mother, Alun Owen spent his youth in Liverpool.

His most characteristic style is the new naturalism nostalgically used to evoke the local colour of Liverpool. He seizes on its idiomatic dialects and the conflict implicit in the clash of race and religion while the ambition of the youngsters' ambition to get away to sea or to London gives a wider horizon to a parochial scene.

Progress to the Park. 1959. P.

This is a leisurely enquiry into the affinities and animosities of Liverpool working folk, especially of a group of four young men and a girl as they eddy about in street, pub, and park. The clash of race and religion is always just below the surface, and what thread of story there is concerns the crossing of young love by parental prejudice. The most lively character is the voluble Welsh Teiton, mouthpiece of Owen's views.

The Rough and Ready Lot. 1959.

A carefully constructed historical play concerns four mercenary officers in a revolutionary army in South America just after the American Civil War. In a different milieu religious strife is again the theme. The convictions of an Irish Catholic clash violently with those of a Welsh militant atheist as to whether they shall shell a Catholic monastery which blocks the pass. Eventually both men are killed, together with the vacillating English colonel, and it is the "simple and ordinary" man, Kelly, who takes command, the conflict of belief still unresolved.

Harold Pinter (b. 1930).

Pinter, one of our foremost playwrights, began as an actor and now also directs. He has a fine sense of film and is the author of some outstanding scripts and exceptionally successful television plays, several being later adapted for the stage.

Pinter exerts an almost hypnotic power over his audience, for he has an assured theatrical expertise and an uncanny sense of tension and the telling pause. Whether the novel situations of his plays find resolution in some final surprise or disturb with some teasing uncertainty, they have a satisfying elegance of design which lingers in the mind.

His art has developed swiftly, and two main phases can now be distinguished. The early plays culminating in *The Caretaker* in 1960, were concerned with the underprivileged and showed a growing sense of compassion and only a passing interest in sex. His later plays are now much concerned with sexual experience and jealousy, the background is sophisticated and the attitude detached sometimes to the point of apparent indifference.

Whatever the subject, the plays have a poetic resonance, due in part to Pinter's intuitive awareness of man's sub-conscious life, especially his fears and memories and some include dream-like sequences of events, sometimes expressing the character's fantasies. *The Birthday Party* reaches its crescendo in archetypal terror, the violent invasion of personal security, a fear that must have assailed man's stone-age ancestor as he lurked

in the squalid shelter of his cave. The subjective fantasies of later plays like *The Tea Party* are more complex as anxiety about losing the sexual partner is subtly fused with the primitive fear of invasion of territory.

Yet the basis of the plays is actuality. As a Jewish boy growing up in East London when anti-semitism and fascism were still a threat, Pinter had personal experience of hostility and aggression, an experience intensified by his knowledge of what his race and other minorities had suffered in Europe. Discussing the intruders in *The Room* and *The Birthday Party* he said, " I don't think it is all that surrealistic and curious because surely this thing, of people arriving at the door, has been happening in Europe in the last twenty years. Not only the last twenty years, the last two to three hundred."

The situation that first fascinated him was that of a room, a door, and two people. He has said, " Obviously they are scared of what is outside the room. The danger that breaks in on them is both comic and shocking, but bizarre as the predicament may be, the play is anchored in actual experience. " I think it is impossible," he says, " —and certainly for me—to start writing a play from any kind of abstract idea. . . . I start writing a play from an image of a situation and a couple of characters involved and these people always remain for me quite real."

But his basic situation is so novel and striking that, like poetry, it can be interpreted on more than one level, both as a revelation of those periods of intense private anxiety when the individual, all but distraught, holds on precariously to some tiny foothold, and also as an image of the predicament of the whole human race whose existence is threatened by ungovernable forces. Like Kafka, whom he admires, Pinter expresses vividly the feeling of inscrutable menace from some vague hinterland invading humdrum human existence. *The Birthday Party*, in particular, has much in common with Kafka's *The Trial*.

In his first three plays the threat is left deliberately unexplained, so that an aura of mystery surrounds the action and violence actually breaks through, but in *The Caretaker* there develops a more subtle menace from within, threatening the mind rather than the body and there is no overt violence.

Some of the disturbing fascination that Pinter exerts is due to the state of uncertainty in which he leaves his audience but the questions posed have become increasingly significant. The audience at *The Room*, 1967 were teased by contradictory information about trivial detail. At *The Collection*, 1962, and *Old Times*, 1971, they were puzzled by the doubts as to the characters' veracity and motive and by the inconsistencies of their memories. Pinter deliberately rejects the Ibsenite rôle of the omniscient playwright, saying, " The desire for verification is understandable but cannot always be satisfied." He points out that it is particularly difficult to be precise about people's inner lives and motives, especially if they are inarticulate.

A related theme has been the ambiguous nature of personal identity, treated with increasing insight, from the puzzle as to who Riley may be in *The Room*, to the pathos of malmed personality in *The Caretaker*, and the possibility of divided personality in *The Lover*.

Pinter has affinities with the dramatists of the Absurd and is closest in feeling to Beckett. Like Ionesco he has employed absurd furniture and properties, but with increasing unobtrusiveness and subtlety, so as to indicate the flux of personal feeling. He shares with Ionesco an awareness of the way comedy can co-exist with tragedy. " Everything is funny," he has said, " the greatest earnestness is funny; even tragedy is funny."

He is a stylist in the use of stage dialogue especially in conveying what is unspoken. He is an expert in the dialect of the Cockney and the shabby-genteel and has a quick ear for the clichés and non-sequiturs of everyday speech. It is talk rather than conversation that he records, what Martin Buber has described as " monologue disguised as dialogue," for his characters talk at people rather than to them. They rarely listen or respond, each bolstering up his self-confidence in an intermittent " monologue " spiced with empty boasting. This is particularly appropriate to the confused and defeated people he portrays, who even in their defensive jargon shrink from human contact.

Although Pinter's dialogue appears on the surface to be little more than a tape-recording of casual talk, there is beneath the demotic prose a compelling poetic rhythm.

Esslin's enthusiastic study, *The Peopled Wound*, 1970, is scholarly and illuminating.

The Room. 1957. M.

Pinter's first play, written in four days for the drama department of Bristol University, is already characteristic. Rose, left alone at night, is nervously aware of the door of her dingy room, especially when a blind Negro, Riley, enters with a message from her father. Her husband on his return savagely kills Riley and Rose goes blind.

The murder of Riley, possibly a rather clumsy death symbol, is melodramatic, but the lit room is a vivid dramatic image of man's tiny area of comfort in an indifferent universe.

The Dumb Waiter, written 1957, produced 1960. M. and P.

In a one-acter Ben and Gus, hired assassins working for some mysterious " organisation," uneasily await their unknown victim in a basement room in Birmingham. The clattering descent of a mechanical Ionesco-like dumb-waiter increases their anxiety, until it is revealed that the victim is Gus himself. Situation and dialogue are both comic and taut with menace. The trite phraseology, as the killers mention " the senior partner," " the job," and " clearing up," ironically uses a business jargon. The tiny play is a microcosm of a treacherous world where violence can suddenly break up man's apparent alliances.

The Birthday Party. 1958. M.

In Pinter's first full-length play, the room is in a shabby boarding-house kept by the motherly Meg. Here Stanley, who claims to have been a concert pianist, has taken refuge, until he is suddenly unnerved by the arrival of a sinister pair, the specious Goldberg and the brutal McCann who like Gus and Ben are there " to do a job." They subject Stanley to a fantastic catechism, a parody of brain-washing, and during his phoney and ludicrous birthday party he is blindfolded and his glasses broken—symbolic of destructon of vision. Next morning the pair lead Stanley away, conventionally dressed in black jacket and striped trousers, incapable of speech, his personality disintegrated.

The menace here is economically sustained through indirect means, and the fact that the identity of the three main characters is never revealed adds to the terror. Some see Stanley as the political refugee; some, since he was a pianist, as the artist who is made to conform by the pressure of society. But by its deliberate lack of definiteness, the play has a wide reference to all who seek refuge from a strange and hostile world.

The Caretaker. 1960. M.

The play is set in a junk-filled room, where the kindly Aston lives in his brother's derelict house. He brings home an old tramp, Davies, who grudgingly agrees to stay as " caretaker " and then tries to encroach further by playing off one brother against the other, until finally rejected by both.

In a naturalistic background Pinter has created two unforgettable characters, presented in psychological depth with reference to their past, and has depicted their failure to come to terms with compassion and restraint.

Davies is one who bites the hand that feeds him. His very identity is suspect for he passes under an assumed name, having " left his papers " years ago " at Sidcup." But he never retrieves them, like Beckett's Krapp repressing part of his past. Aston haltingly tells Davies how he once had periods of unique lucidity, now destroyed by a terrifying shock-treatment he was subjected to in mental hospital, but Davies' only reaction is later to threaten him. It is remarkable that when Aston finally rejects Davies' last encroachment the plight of the tramp should seem as pitiful as Aston's own, Pinter having wisely rejected his

first intention to end the play with the violent death of Davies.

This mature play shows a man actually opening the door to his fears and mastering them. Aston in his long speech faces the wrong done to him by "people." His unique vision destroyed, his only creative outlet has been tinkering with his hands, but as he tries to break out of his isolation by befriending another crippled human being, he unhappily meets a man so twisted by his own suffering and resentment that he cannot respond. Some find in Aston a moving image of the mystic and artist in man whose creative insight is destroyed by an imperceptive and mechanical society. The film is excellent.

A Slight Ache. 1961. M.

A short play, shows an elderly couple haunted by a match-seller, who stands speechless at their gate. Eventually the wife takes him into the home instead of the husband. Possibly the silent match-seller represents the unconscious desires of the wife and the anxieties of the husband.

A Night Out. 1961. M.

This compassionate and realistic brief play shows the clerk, Albert, trying one night to escape from the retarding domination of his nagging and self-righteous mother. After threatening her violently he finally finds himself in the room of a prostitute who proves equally peevish and would-be genteel. It is doubtful whether Albert's violent gestures have won him any independence.

The Collection. 1962. M.

In an assured comedy of manners, Pinter makes authentic use of mystification.

Did Stella in fact sleep with a stranger, Bill, in Leeds? She tells James, her husband, that she did so, but during the course of the friendship that develops between the two men, Bill gives three contradictory accounts of what is supposed to have occurred, while Harry, an older man who has given Bill a home, becomes increasingly jealous of James.

Ironically Stella's story, told perhaps to pique her husband, impels him away from her to male society and the changing of partners has the elegant formality and economy of a dance movement.

Pinterian violence is here only lightly indicated.

The Lover. 1963. M.

An arresting short play shows the husband (Alan Badel) and the wife (Vivien Merchant) first as affectionate but distant partners, and then with provocative change of clothes as erotic lovers. The performance of symbolic rôles, including dressing up in fetish garments, had already been used by Genet. Pinter cleverly adapts the device to discriminate between the apparently incompatible strands in the marriage relationship, a distinction analogous to that between Aphrodite Urania and Aphrodite Pandēmus.

The Homecoming. 1965. M.

Teddy (Michael Bryant), a Doctor of Philosophy in an American University, brings his wife, Ruth (Vivien Merchant), on a surprise visit to his former home in North London, where Max (Paul Rogers), his widowed father, still lives with his two younger sons, Lenny and Joey. It is gradually revealed that Ruth before her marriage had been a "model" and the family decide to keep her as their common mistress, while Lenny, a pimp, arranges that she shall earn her keep as a prostitute. The plot is underlined by Lenny's bragging anecdotes of sexual brutality—a counterpart to the more undifferentiated violence of the earlier plays.

Because this is all presented with clinical detachment, the audience is induced to suspend emotion. Only at the last moment is this cool acceptance shattered by an outburst of human feeling when Max, aged 70, crawls sobbing to Ruth asking to be kissed and the audience is shocked into feeling the degradation involved.

On the surface the play is a disillusioned glance at life. "It would be ridiculous to maintain that what we know merits reverence," says Lenny. It may also be interpreted as a fantasy of sexual gratification, which in a dream state escapes the taboo of ethical and humane feeling and can be indulged in without demur. The use of some accepted sex symbols and the slow and trance-like acting, especially that of Ruth, is dream-like in its effect and the final shock of degradation is analogous to waking up and realising what the dream has implied.

It is possible also to see in Teddy an acquiescent Hamlet. He returns home from a foreign university to find marital infidelity, for it is disclosed that his mother had been unfaithful with an uncle figure. Ruth is the counterpart of Ophelia, who was bidden by Hamlet, "Get thee to a nunnery"—(an Elizabethan cant term for brothel). Teddy is like Hamlet also in that he prefers "to operate on things and not in things."

The Homecoming is professionally brilliant, but it lacks the depth of reference and emotional power of Pinter's earlier plays.

Landscape and *Silence.* 1969. M.

Beckett's influence is apparent in two short plays, where inconclusive words and action are pared to the bone and whose theme is personal isolation. Both recall *Krapp's Last Tape* in their repetitive memories of past love.

Landscape, originally broadcast, is set in the kitchen of a country house, where the middle-aged caretaker appears to be telling his wife (Peggy Ashcroft) of the day's commonplace events and recalls an infidelity. She, absorbed in dreaming of a tender encounter on the sea-shore—possibly with him when younger—ignores him.

Silence is even more spare and brief, although it took Pinter longer to write than any other play. Ellen sits between two men. Both have loved her in vain, although she has all but forgotten them. They are almost immobile, their only speech interlacing, fragmentary memories of love. These are redolent of the country, mostly at nightfall. The men are faintly characterised. Bates, the younger, remembers the market, a brothel; Rumsey his own house. Setting is discarded in favour of "three areas." In comparison with *Krapp's Last Tape*, *Silence* is like three simultaneous and hesitant tape-recordings running in a void and in structure it resembles Beckett's *Play*.

The Tea Party and *The Basement.* 1970.

Two plays originally seen on television were perfectly suited to the medium of film, since both make swift transitions from objective happenings to subjective fantasies. They were however translated as faithfully as possible to the stage. Both involve the theme of encroachment on personal territory.

The Basement, written first, is like a chic version of *The Caretaker*. A fastidious bachelor, Law (Donald Pleasence), welcomes to his flat an old friend Stott, who brings his girl friend. Both promptly take possession, even of the host's bed. Law alternates between friendly chat and suppressed fantasies, such as romantic seduction of the girl and violent duelling with Stott. The play suddenly concludes with rôles reversed, Law being the visitor demanding admittance.

The Tea Party centres on Disson, a middle-aged plumbing tycoon. Just before his marriage to a young woman socially his superior, he engages a new secretary, Wendy (Vivien Merchant), teasingly seductive, with whom he is soon infatuated. His confusion increases when his patronising wife comes to the office as his secretary, and when he suspects an incestuous liaison between her and her parasite brother.

Since wife, secretary and even he as husband have each a curious distorted double, Disson's vision, not surprisingly, becomes confused. A single table-tennis ball appears to him as two and he can only touch Wendy when blindfolded. His hysterical blindness culminates, at an office tea party, in complete loss of sight.

Poor Disson had, from the outset, been blind to his social position and his sexual needs.

Both in certain incidents and in the protagonist's paranoia the play has echoes of *The Birthday Party*, but now all on a fashionable level.

Old Times. 1971.

In their converted farm-house, Deeley and his wife Kate await the first visit of Anna, her friend in London twenty years before. As Deeley jestingly probes the dreamy and laconic Kate for information he is startled to learn that the two girls "lived together," and Anna then comes forward from the symbolic half-light where she has been waiting.

In an exchange of conflicting memories Deeley and Anna begin to strive for possession of Kate, even in retrospect. To Deeley's happy reminiscence of first meeting her at the film *Odd Man Out*, Anna replies by recalling the night when she found Kate with a man sobbing in their room and then casually mentions that it was she who had accompanied her to that film.

In the second act tension increases. Deeley alone with Anna insists that he recognises her as the girl he had picked up at a pub. Anna's riposte is that she was then wearing Kate's underwear so that his memory of the two girls becomes confused.

His jealousy of Anna, inflamed by her talk of her expensive home, flares out in anger at her mention of the word "passion." But Kate remains withdrawn until a strange final speech. She had, she says, seen Anna lying dead in their room with earth on her face and her place taken by a man. She had tried to plaster his face with earth but he had resisted. Is this Kate's rejection of both rivals? Anna turns to go. Deeley sobs silently. Then brightly lit all three are seen as in their opening conversation, as though locked together by their past.

Although like the lyrical *Silence* concerned with the erotic memories of three people, this play is taut and tense. The personalities are clearly conceived, the dialogue richly suggestive. Most ironical is Deeley's and Anna's capping each other with snatches of old songs addressed to Kate. "The memory of all that . . .". "No, no, they can't take that away from me."

In a play whose theme is cherished memories destroyed Pinter's use of ambiguity is seen at its best.

Terence Rattigan (b. 1911).

Rattigan, with his flair for light comedy, is an expert in the well-made play. His later, more serious work, includes *The Deep Blue Sea*, 1952, and *Ross*, 1962, about T. E. Lawrence.

A Bequest to the Nation. 1970.

A somewhat ornate historical play spans Nelson's final days in England. Like *Ross*, it sympathetically probes intimate problems of a national hero, its theme the conflict between Nelson's infatuation for Emma and his duty, to which finally she generously yields. Rattigan cleverly uses Nelson's schoolboy nephew to emphasise duty, to act as dramatic link with Lady Nelson and as the "juvenile sensibility," whereby Emma's tipsy decline is sharply focused.

In Praise of Love. 1973.

In a double bill a thirty-minute curtain-raiser proved unsuccessful while many critics considered the second play one of Rattigan's best.

Before Dawn. An unfortunate inversion of Puccini's *Tosca* represents the police chief successfully seducing the heroine while her lover faces execution. It is further marred by some clumsy puns.

After Lydia. Lydia, an Estonian émigrée, is married to the successful literary critic, Sebastian, dogmatic and gruff in manner. Lydia keeps from him the fact that she is dying of leukaemia, unaware that he already knows. Husband and wife each trying to save the other pain is suffering in consequence. Eventually Lydia is able to face death secure in the realisation of her husband's love.

David Rudkind.

Afore Night Come. 1962. P.

In a Worcestershire orchard the fruit pickers enact the ritual murder of a freakish old tramp whom they dread as a threat to their virility. A realistic working day world is infused with the primitive terror of *The Golden Bough*.

Jean-Paul Sartre (b. 1905).

The plays of the French philosopher, Sartre, can be fully interpreted only in the light of his atheistic existentialist philosophy. Discarding conventional morality, Sartre insists that the individual must evolve his own ethical code through daring freely to choose and act for himself. He must also will this freedom for others, and by seeking to establish an interdependence of freedoms he "engages," or "commits" himself in the political struggle.

Sartre himself is a communist and his best plays, like those of Brecht, are fully "committed" to left-wing ideology. They have sought to vindicate the inevitability of violence in the struggle for freedom and to decry the "bourgeois morality" which shrinks from such crime.

Sartre is also concerned with the "absurdity" of man's predicament as a rational creature in an illogical and indifferent universe, but unlike Ionesco he presents the situation, not through absurd images but through the medium of the traditional well-made play.

Sartre has had a considerable influence on the climate of ideas, encouraging an attitude of harsh disillusion and stimulating the current discussion as to whether or not drama should be a vehicle for social and political convictions. It is interesting to contrast the views of Wesker and Pinter on this issue.

Lucifer and the Lord. Published 1951. P.

The dilemma between non-violence and force is here given greater universality by being projected back into the time of the Peasants' Revolt in Germany. The brilliant General Goetz, having failed in a policy of Christian love, unflinchingly embraces a ruthless violence as the only possible "realist" social ethic.

Nekrassov. Published 1956. P.

A satirical farce ridicules the sensational anti-communism of a section of the popular French press.

Altona. Published 1956. P.

This play, showing a former Nazi officer going mad in an attempt to justify his own resort to torture, is an attack on "Western morality" in its own recourse to torture, used by French colonials in Algiers. The film version well reproduces the claustrophobic horror.

James Saunders (b. 1925).

In Saunders' early work the influence of Ionesco is apparent in the satirical use of a banal dialogue, in which the characters converse without communicating, and in the reference to some concrete symbol which represents their anxieties or predicament. His later work is reminiscent of Pirandello. Nevertheless Saunders' ingenious plays have a freshness and vigour all their own.

Alas Poor Fred.

In a one-act play a friend who had some time ago been cut in half is the symbol of a married couple's former passionate love life, long since sundered. The situation is like that of Ionesco's *Amédée*.

The Ark. 1959.

In a more direct style this full-length play of ideas re-interprets the Old Testament story.

Ends and Echoes. 1960.

This is the general title for three clever one-acters. In *Barnstable*, the most amusing one, a house is gradually collapsing around its unwitting inhabitants, a symbol of the disintegration of their conventional way of life.

Next Time I'll Sing to You. 1963.

Based on Raleigh Trevelyan's book on the

hermit of Canfield, who died in 1942, this moving play uses the rehearsal style of Pirandello's *Six Characters*. Like an elegiac quintet is explores the theme of solitude.

A Scent of Flowers. 1964.

Like the previous play, this is a reconstruction of the past. It is gradually revealed that the character, Zoe, is in fact the spirit of a girl who has just committed suicide, because her love for a married man is incompatible with her religion. The play proceeds by her touching encounters with the circle of relatives and friends to whom she had turned in vain for help.

Neighbours. 1967.

Neighbours was presented with another short play, *Dutchman* (F), by Le Roi Jones. Both use an emotional encounter between a Negro and a white woman to focus the strain between the races.

A Negro invites himself into the flatlet of a young woman on the floor below. With some hesitation she entertains him. He then steadily challenges her enlightened liberalism as merely patronising and finally in what amounts to moral blackmail asks her to come and sleep with him. Confused and compassionate she yields.

The initial meeting is conveyed with much delicacy. Then as the Negro assumes the rôle of counsel for the prosecution, a logical pattern is unconvincingly forced on the naturalistic material.

Anthony Shaffer (b. 1926).

The playwright, once a barrister, has also written television and screen plays. He is twin brother of Peter Shaffer (*q.v.*).

Sleuth. 1970.

A famous writer of stories about a wealthy amateur detective plans to outwit his wife's lover, and inviting him to their country house he there emulates his own fictional hero.

In this highly successful and entertaining piece Shaffer has contrived to combine not only an ingenious play full of suspense and surprises but also a witty parody of the very genre of detective thriller that he himself is presenting.

Peter Shaffer (b. 1926).

Shaffer is an assured and ingenious dramatist whose first success was with the realistic well-made play and who has since moved on to freer modes of composition.

His plays operate successfully on two levels: they offer insight into the subtleties of personal relationships, especially into the difficulties of adjustment between people of different cultural background, and they also involve discussion of ideas. The aesthetic problem of distinguishing between genuine love of art and snobbish pretension is a recurring theme, often presented in a triangular situation.

Five Finger Exercise. 1958. P.

An alive, realistic play shows Clive, the young Cambridge student, growing away from his stifling mother, with her pretensions to modish culture, but failing to make contact with his honest philistine father. The advent of an enigmatic stranger, Walter, acts as a catalyst. Mother and son are both attracted to Walter, the father's fierce jealousy is aroused and Walter is narrowly saved from suicide.

Shaffer shows some of Ibsen's precision in his probing of a family situation where the members change and develop as they become painfully aware of their hidden drives.

The Private Ear and the Public Eye. 1962.

Two short and spare triangular plays both demonstrate the influence of artistic taste on the relationship between the sexes.

The Private Ear.

Bob, a shy music-lover, asks Ted to help him entertain a girl whom he has met at a concert. But the ignorant girl is won by the complacent Ted's vulgar patter and Bob, left alone, defaces his gramophone record and forces himself to listen to the broken music of love.

The Public Eye.

A witty, ironic comedy shows Charles, a correct and pompous dilettante, unwarrantably jealous, employing a private detective, Louis (Kenneth Williams) to spy on his wife. She becomes attracted to Louis because of their shared joy in things of beauty. With the entry of the iconoclastic Louis, a brilliant, comic invention, farce and tenderness go hand in hand with high comedy.

The Royal Hunt of the Sun. 1964.

A sweeping "epic" drama of Pizarro's fantastic conquest of Peru skilfully uses, as narrator, "old Martin," who watches his own boyhood as page to Pizarro. Shaffer deploys "total theatre" in dazzling ceremonial, processions and masks, in ritual dancing, mime and strange, metallic music.

There is rich thematic material in the clash of "two immense and joyless powers," in the conflict of Christianity and Sun worship. Personal tragedy develops in the mutual attraction felt by the grizzled Pizarro (Colin Blakeley) and the young Inca, Atahualpa (Robert Stephens). Captor and prisoner, they painfully seek for the god in each other and the Inca accepts death both as a sacrifice to friendship and the final test of his faith.

Black Comedy. 1965.

A highly successful brief comedy frankly uses an effective device of Chinese theatre. During a party the lights fail and the stage, although supposed to be in darkness, is still fully illuminated, so that the ludicrous behaviour of the dramatis personae is visible only to the audience.

The Battle of Shrivings. 1970.

The idealist Sir Gideon (Gielgud), whose home is "Shrivings" (suggestive of confession and penance) is an eminent philosopher. He is committed to belief in human perfectibility and pacifism, and lives a celibate life with his unselfish wife, Enid. With them resides David, son of Gideon's former pupil and friend Mark (Patrick Magee). Mark is a famous poet long expatriate, who now visits Gideon on the occasion of their both receiving an Oxford award.

The life and ideas of the robust and cynical Mark, who is now toying with Roman Catholicism, have become the antithesis of Gideon's and he maliciously challenges his host to an extraordinary contest. He will return to humanism if, whatever he may do, Gideon can endure his presence for the weekend!

Mark then disillusions Enid by revealing Gideon's homosexual past. He seduces the girl friend of his own son and cruelly pronounces him to be a bastard.

Both contestants win but both are broken. Gideon, bitterly taunted by Enid, is provoked to strike her and reduced to despair, while Mark is attacked and beaten down by his son.

The play, like Bolt's *The Tiger and the Horse* (*q.v.*), is an honourable attempt to dramatise philosophical and ethical problems, especially the discrepancy between man's idealistic convictions and his personal relationships. But lengthy exposition and discussion delay the final action and the characters and plot are too schematic for an organic development.

The fact that the play appeared soon after the death of Bertrand Russell and recalls his friendships with writers such as D. H. Lawrence, rather weakens its impact.

Equus. 1973.

In attempting to penetrate the motive of a shocking crime of which he had been told, Shaffer has created a compelling work of art.

Dysart (Alec McCowen), overworked child psychiatrist in a provincial hospital, accepts as patient Alan Strang, a part-time stable boy who has inexplicably blinded six horses. Shaffer's vivid imagination has been brilliantly interpreted in John Dexter's inventive production.

An open stage with a palisaded square within a circle and selective lighting are so skilfully de-

ployed that they instantly indicate such diverse locations as the stable, the psychiatrist's consulting room, Alan's hospital cubicle, the Strangs' home, a beach, and often two locations at the same time, so that Dysart's interviews with Alan and others melt into enactment of the deeds he is uncovering.

Alan's well-meaning parents are unfortunately incompatible, his mother religious, his father a self-educated atheist. The boy's first memorable experience had been on a beach when a stranger took him onto his horse, until his ecstatic ride was roughly interrupted by his parents. His fascination with horses was fostered by his mother's constant re-reading of a favourite story and also of splendid Biblical passages such as that from Job. Thus Alan's erotic and religious emotions become fused. A harrowing picture in his bedroom of Christ on the way to Calvary was torn down by his outraged father and replaced by one of a horse gazing directly at the onlooker, and Alan came to worship this image of Equus the chained god, devising his own ritual of obeisance and self-flagellation.

He had no chance to ride until he found a week-end job as a stable boy. There he would fondle his favourite horse, Nugget, like a lover and one night in every three weeks would gallop naked and bareback in a lonely field, in secret ecstasy.

One night the stable girl excited Alan by taking him to a blue film, where to his dismay he saw his respectable father. She then attempted to seduce Alan in the stable, but unsuccessfully, for he was agonised by his treachery to Equus his beloved and his god. Driving the girl away he vainly implored forgiveness from Nugget's implacable stare and in desperation stabbed out the eyes of all six horses in the stable.

Since the audience watch Dysart's meetings with Alan's parents and his gradual winning of the boy's confidence and at one and the same time the actual events which he elicits, the play is a gripping detective story and fascinating psychiatric study.

But the extraordinary relationship between doctor and patient gives it a special depth. For Alan has the psychotic's instinct for sensing Dysart's own problems and throughout presents an urgent challenge. For Dysart's own life is devoid of sexual or religious passion, his marriage sterile, his only contact with the intuitive life he values his prim annual holidays in Greece. In his own terrible nightmare he sees himself as a masked priest sacrificing children and tearing out their entrails. He has lost faith in his vocation and says that in bringing Alan back to the drab normal he is destroying his capacity for reverence and rapture.

Some critics have assumed that Dysart's estimate of his own worth is that of Shaffer and that the playwright is decrying psychiatry itself. This is a misreading, for the wise and humane woman J.P. who first brings Alan to Dysart feels only gratitude for pain banished and in an introduction to the play Shaffer, acknowledging his debt to the advice and expert comment of a distinguished child psychiatrist says, "I have also come to perceive that psychiatrists are an immensely varied breed . . . Dysart is simply one doctor in one hospital. I must take responsibility for him as I do for his patient."

N. F. Simpson (b. 1919).

N. F. Simpson's plays of the Absurd are in the peculiarly English vein of Lewis Carroll and Edward Lear, a world of surrealist fantasy, *non-sequitur* and nonsense. It is almost a contradiction in terms to organise such material coherently and to do so in a full-length play is a *tour de force* which Simpson brought off in his *One Way Pendulum*. His best work ridicules the mechanical and conventional existence, the attenuation of feeling, of the little suburban home, his usual milieu.

The Resounding Tinkle. 1957. P. F.

A most unusual play, which pokes fun at suburban life, discards plot, progress, and characterisation, and the uniform dialogue is one continuous flow of clever verbal paradoxes and *non-sequiturs*. The apologetic "author" appears at intervals and in the final act there is a parody discussion of the play by a panel of "critics"—devices used by Ionesco in *The Shepherd's Chameleon*.

Simpson's verbal agility is exhilarating, but some find the play over-cerebral. It is certainly at the opposite end of the spectrum from Ann Jellicoe's *The Sport of My Mad Mother*.

One Way Pendulum. A Farce in a New Dimension. 1959. F.

Here Simpson has devised a framework built of whimsy and yet firm enough to carry its own logic and to be dramatically satisfying. The characters are drawn simply, but consistently, each with his own "humour," in the manner of Ben Jonson and the dialogue is a close parody of banal family interchange.

The play concerns a suburban family, the Groomkirby's, whose son, Kirby, is teaching a collection of weighing-machines to sing the Hallelujah Chorus. His ineffectual father is combining his two favourite hobbies of law and "do it yourself" carpentry, by building an enormous model of the Old Bailey in the living-room, where the phlegmatic mother pays a charwoman to eat up the "left-overs."

Finally a trial takes place in the Old Bailey and Kirby is convicted of murdering forty-three people in order that he may wear black, the weighing-machines being part of a complicated device to cause a holocaust of death.

The main theme of the play is the tyranny of things, which is exemplified by the absurd Ionesco-like objects. These are treated with the respect due to human beings while human beings are treated as things, and father and son are so obsessed by things that they cannot get into touch with one another.

The tyranny of mechanical routine and social custom is also indicated. Kirby will only eat when a cash-register rings and will only wear black when it is sanctioned by funeral convention.

The anxiety and guilt which result from a starved and mechanical existence are finally symbolised in the nightmare parody of a trial scene in the final act.

Although the stage objects are novel and intriguing and can be assigned a clear meaning they lack the suggestive power of Ionesco's chairs or rhinoceroses. Contrived rather than intuitive, they illustrate more than they illuminate the human condition. But the play is an original and successful experiment and the implied comment on the unconscious assumptions and compulsive habits of the Groomkirbys has a wide reference.

The film version is recommended.

The Cresta Run. 1965.

A play about counter-espionage proved disappointing, partly because its mockery is directed at a schoolboy dream rather than at a general malaise, partly because it lacks the bold structural outline of *One Way Pendulum*. Even the absurd objects—keys, codes, disguises—are trivial compared with the "Old Bailey." Simpson has also lost some of the claustrophobic compulsion of his earlier plays by his constant switching of the action from the home of the suburban couple to the Ministry and back again.

It is unfortunate that a promising latent theme—the compulsion felt by the Security man to divulge his secret information—is swamped by trivia, while the best jest is only a casual aside—the suggestion that in England Intelligence should logically be in the hands of private enterprise!

Was He Anyone? 1972. F.

On a cargo-boat, "several sizes too small for him", Whitebrace, a bookie's runner, absent-mindedly runs into the sea. He treads water for over a year, while his plight is elaborately discussed by bureaucratic and charitable organisations and is depicted on the media.

So that he may improve himself culturally while waiting he is given a baby-grand on which he learns to play. The World's National Help-You-Out Week professes concern, the P.M. hopes to gain popularity with photographs of himself shaking hands with the wife and cruise ships stop to watch her husband's struggles. Eventually a

private citizen thinks to throw a life-belt, but it causes concussion and death.

Appropriately the actress playing Mrs. Whitebrace is the only one of the cast not to change rôles during the play. The other six, as in a cabaret, quickly impersonate a number of figures, devious, foolish or pompous.

A lively surrealistic comedy satirises popular voyeurism and the procrastination of official and charitable organisations in helping "the drowning man".

Wole Soyinka (b. 1934). *See also* **Section M.**

Soyinka, a Nigerian and an English graduate, is an admirer of Brecht, Arden, and Dürrenmatt.

The Road. 1965.

The Road, set in a drivers' haven in Nigeria, successfully produced with a large cast of coloured actors, later won a Dakar award.

The Lion and the Jewel. 1966. O.U.P.

In a lively comedy, presented by the Ijinle Company of African actors, the jewel is Sidi, the belle of a Yoruba village. Elated at being photographed for a glossy magazine, she rejects both the native schoolmaster and the old chieftain, the Lion, until cunningly seduced by him she exultantly joins his harem.

Native culture, with vivid ritual dance and music, is presented as more alluring and virile than European, which is mocked both in amusing mimes and in the shabby, ineffective schoolmaster infatuated with Western gadgets.

Tom Stoppard (b. 1937).

Stoppard has written plays for radio, including the engaging *Albert's Bridge* (F), and for television.

Rosencrantz and Guildenstern are Dead. 1966. F.

Stoppard's diverting play is a gloss on *Hamlet* and he dovetails snatches of Shakespeare's tragedy with his own action or rather inaction, for his archtype is Beckett's *Waiting for Godot*.

He humorously chooses as protagonists the two nonentities, Rosencrantz and Guildenstern. Summoned inexplicably to Elsinore, they hang about, always on the fringe of great events they do not understand, passing the time, like Shakespearean jesters, in witty word play and fruitless speculation as to their situation and destiny.

Their predicament is a suggestive image of the bewilderment of the ordinary man faced with world events beyond his grasp and, at a deeper level, with the existential problem of man's very being on this earth, and the imminence of death.

The rehearsals of the Players, the counterpart of the enactments of Pozzo and Lucky in *Godot*, create a further film of unreality and illusion.

The play is too long, the second act not sufficiently contrasted, but it is remarkable that so derivative a play should be so delightfully fresh and original.

Enter a Free Man. 1968. F.

This comedy is an extended version of a television play of 1963. Reilly (Michael Hordern), a self-styled "inventor" of unworkable Heath Robinson gadgets, "leaves home" regularly every Saturday to spend in the pub the ten shillings pocket money allowed him by his working daughter, always to return home when his money has run out. His long-suffering wife (Meg Jenkins) has consoled herself with the hope that if he's to be "a failure anyhow, he might as well fail at something he'd like to succeed at"!

The situation, although genuinely funny and pathetic, is not adequate to a full-length play.

The Real Inspector Hound. 1968. F.

This crisp and intelligent burlesque, like Sheridan's *The Critic*, uses the device of the play-within-the-play. It is a simultaneous parody of jaded theatrical convention and modish theatrical jargon.

Two critics are watching an absurd drawing-room whodunit, with a corpse ignored by all taking the centre of the stage. But the main focus of interest is the critics. Both are obsessed, the introverted Moon, only a "stand-in," by jealous hatred of his professional superior, the absent Higgs, while the eupeptic Birdfoot is always infatuated with the latest actress.

Then at the ringing of a stage telephone absurdity completely takes over. The call is from Birdfoot's suspicious wife! He is drawn on stage where he takes on the part of the fickle lover, soon to be followed by Moon, when told that the stage corpse is that of Higgs! In a few minutes both critics in consequence of their private obsessions have been shot dead, the sharp crack of retribution not unusual in Stoppard.

Beneath the glittering, zany surface of the play lies the concept of drama as the mirror, Hamlet's "mirror up to nature," wherein we see and identify ourselves with the dramatis personae.

The play formed part of a double bill with Sean Patrick Vincent's musical satire, *The Audition*. It appears that Stoppard's comic genius finds its best vehicle in the short play, which his dazzling virtuoso invention can sustain to the end.

After Magritte. 1970. F.

Stoppard has himself interpreted his one-act surrealistic comedy. Fascinated by the paintings of Magritte, with their quirky juxtaposition of objects painted in the finished style of a nineteenth-century academician, Stoppard has tried to emulate the painter in theatrical terms. Within the orthodox framework of the well-made play he has presented unrelated incidents, even using some of Magritte's favourite images, such as the tuba, apple and woman with her head covered, as well as one of his own favourites, the detective. He has felt compelled to invent a logical causation for the bizarre sequence. The result is a playlet that is visually and verbally most ingenious, but much too static—an amusing trifle that resembles a clever five-finger exercise.

Jumpers. 1972. F.

In a hilarious virtuoso piece Stoppard displays the farcical inventiveness of a Marx brothers' film, with proliferation of zany incident and slapstick, all sizzling with verbal wit. He juggles with wildly incongruous incidents and yet sustains a serious theme, that of "credibility", for Stoppard is extremely sceptical of claims to certainty of knowledge or belief. He ridicules political dogmatism and the pretensions of psychiatry and in two-fold guise he parodies the contortions of academic philosophy as physical and mental acrobatics.

The scene is the flat of George Moore, a dishevelled Professor of Moral Philosophy, and the action, set on a revolving stage, shifts swiftly from one room to another. George has married the lovely Dorothy, or Dotty, a musical comedy star now retired with a nervous breakdown, for since a landing on "that Juney old moon", she can no longer sing her romantic moon songs with any conviction.

In her sumptuous bedroom Dotty is accustomed to receive the suave and immaculate Vice-Chancellor, Archie, her lover and, most opportunely, her psychiatrist also, while in his study George worries away at moral abstractions like a tousled dog with a bone.

At a victory party thrown by Dotty celebrating a Radical–Liberal *coup d'état*, Archie compères a performance by his "jumpers", gymnast philosophers—logical positivists, linguistic analysts and the like, for Archie professes strict rationalism in both philosophy and politics. They form a human pyramid but at its base McFee, Professor of Logic, is unaccountably shot dead. The pyramid collapses and Dotty is left alone with the body, which is later seen hanging from a door in her bedroom.

This symbolic collapse of philosophic coherence is paralleled by George's verbal fumblings on the credibility of God and of moral absolutes as, oblivious of the murder, he dictates his refutation of McFee's contribution to the annual symposium on "Man—good, bad or indifferent?" George retains some confidence in man's ability to discern moral value by intuition and since "to sustain the attention of rival schools of academics by argument alone is tantamount to constructing a

Gothic arch out of junket", he intends to demonstrate his points with Zeno's bow and arrow and a specially trained pet hare and tortoise. Inadvertently he shoots the hare, Thumper, (*cf.* jumper) and in his dismay crushes the tortoise underfoot.

Dotty, suspected of McFee's murder, is questioned by Inspector Bones, an ardent fan of hers, who arrives with a bouquet since he can hardly arrest her "by Interflora". But the all-accomplished Archie, whose jumpers have deftly disposed of the body in a plastic bag, is also Dotty's lawyer and even the coroner and easily manipulates Bones.

A further dimension is given to the play by political events, for Archie's party, the Rad–Libs are rationalising the Church, like the railways, and have appointed as Archbishop their spokesman for Agriculture, an agnostic. "It's like the Chairman of the Coal Board believing in oil", concedes Dotty.

The progress of the lunar landing, seen on a huge television screen, provides an even more remote perspective. The two amoral astronauts, Captain Scott and Captain Oates, have fought each other for survival. For Dorothy this makes earth's morality parochial while conversely, McFee had been reminded of the self-sacrifice of the Antarctic Captain Oates and had had ruefully to admit that if irrational altruism is indeed a possibility then his logical arguments were "up a gum tree".

The contrast between the successful Archie, a cocksure and cynical opportunist, and the ineffectual George, oddly engaging our sympathy in his desperate search for truth, effectively dramatises an underlying concern with genuine values. These, like the identity of the murderer, remain unverified.

In using such stock situations as cuckolded husband and detection of murder as vehicle for erudite parody, Stoppard has brought off a *tour de force* both theatrical and literary.

David Storey (b. 1933). *See also* Section M.

Storey, also a novelist, is the son of a Yorkshire miner and helped to support himself at the Slade by playing professional Rugby for Leeds. He wrote the film-script for his own novel, *This Sporting Life*, and Lindsay Anderson, while directing it, encouraged him to revise his discarded play, *Arnold Middleton*.

Anderson has directed Storey's four subsequent plays and the imaginative rapport between producer and playwright has led to their being interpreted with singular insight and restraint.

One theme in Storey's work, as in Mercer's, is the stress felt by the educated offspring of working folk. Many plays involve reference to mental trouble or instability and he is much interested in the theories of R. D. Laing.

The plays are grounded in every-day life, frequently in Storey's own experience. Yet they have become increasingly poetic in approach, in that their significance is consciously ambiguous, and "escapes and refuses definition." Storey deliberately leaves "all the options open." He also says that, if on reading something through, he "knows completely what it is all about, then it is dead," but if it mystifies him then it has "taken on an independent life of its own."

Storey is refreshingly versatile in subject and approach and each new work shows a growing mastery and maturity. A genuine and unassuming artist, he is now one of our best playwrights.

The Restoration of Arnold Middleton. 1967. P.

Arnold, a young schoolmaster (as Storey once was) is a jesting eccentric, his latest acquisition an outsize suit of armour introduced during the play's revision. But Arnold's clowning disguises the fact that he is going mad.

The theme is reminiscent of Mercer's *Morgan*, with the gorilla suit, but the exuberant comedy tends to blur the issue and the interpretation of the hero's instability and lightning recovery is inadequate.

In Celebration. 1969. P.

Three sons return home to celebrate the fortieth wedding anniversary of their parents, doting collier husband and complacent matriarch, who considers herself his social superior.

With first-hand realism Storey conveys the disorientation and embarrassed filial feeling of sons educated beyond their origins. The eldest brother, the iconoclastic Andrew, is hell-bent on tearing down the family façade and tries to force on stolid Colin and sensitive Steven his theory that their ambitious mother had distorted their lives into a false respectability to appease her own sense of guilt. When six months pregnant, she had felt obliged to marry the collier father and after the firstborn had died at the age of seven, she had tried to commit suicide.

After an extravagant dinner at the local hotel, Andrew lashes the bewildered father with his scorn and only the concerted efforts of Colin and Steven can help to reassure the old man and get Andrew away next morning before he can confront the mother.

The psychological motivation is not fully credible but this compassionate and close-knit play, with the past haunting the present, recalls Ibsen, especially since Andrew is an ignoble counterpart of Gregers Werle in *The Wild Duck*.

The Contractor. 1969. P.

Five men leisurely assemble and later dismantle a huge tent for the wedding of the contractor's daughter, while members of the family drift in and out. The workers' banter and taunts and the family casual talk hint at hidden hurts, but the focus of the play is the actual work on the tent—as in Ionesco a "thing"—presented here with no absurdity or phantasy but with almost the faithfulness of documentary, for Storey can draw on his own experience of the job.

The image is however metaphorical and because the play cannot "be confined to any one definition," Storey finds it one of his most satisfying works. He sometimes sees it as "somehow related to the decline and falling away of capitalist society" or "as a metaphor for artistic creation." Yet "it still continues to make sense—and complete sense—as the story of these men who put up this tent and that's that."

Home. 1970. P.

Sitting at a garden table, on the only two chairs available, two ageing gentlemen, Jack (Ralph Richardson) and Harry (Gielgud), gently and diffidently make conversation. Jack, slightly more dapper, and prone to pointless family anecdote, usually takes the initiative in their exchange of dated clichés and banalities. The broken phrases refer to wives now separated, ambitions unfulfilled, the clouds, but real communication can only be unspoken and there is sad irony in Jack's, "So rare these days nowadays to meet someone to whom one can actually talk."

When these leave, their places are taken by two rough, "Cor blimey" women, full of prurient innuendo and scandal, and when the gentlemen return and courteously escort "the ladies" to "corn beef hash," it has gradually become apparent that this is a mental "home." Act II begins with the entry of a leucotomised young man who aimlessly shifts the furniture about.

The play, heart-breaking in its naturalistic fidelity to human inadequacy, is handicapped by some monotony of incident and dialogue. But, like Beckett's *Godot*, also a strange quintet, it works through poetic suggestion. The ironic title and the furniture, inadequate for 2000 people, are significant as is the apparently irrelevant juxtaposition of phrases, which are in themselves ambiguous metaphors. ("This little island." "Shan't see its like." "Oh, no." "The sun has set." "Couple of hours.")

But the decline of hope and vitality (perhaps that of England herself) is most potently expressed by the unadorned shape of the play, the decline of the day from morning to evening, the sky overcast, the rain that of the old men's silent tears.

The Changing Room. 1971. P.

Storey can rely on his own memories of Rugby League football when he paints the bare, chilly, changing room. Opened up by the caretaker, a muttering old pensioner, it is gradually taken over by the players, clearly individualised and arriving

in ascending order of their social status, to be treated by the masseur, advised by the trainer, briefly encouraged by the Chairman, until changed into their kit they stand as a team, silent for a moment before trotting down the tunnel to the icy pitch and the roar from the stands.

The second act includes the brief half-time when the battered players, committed by their common hazard and purpose are now welded into a corporate body. In the third, exultant after victory, they joke and bath in easy comradeship until with his everyday clothes each man assumes his separate identity and only the caretaker is left.

Storey here develops and refines the deceptively easy naturalism and the novel pattern of *The Contractor*, but peripheral and rather conventional interest such as that of the Contractor's family, which intrudes on the work scene, is now pared away and Storey wholly commits himself to the re-creation of men thrown together by the exigencies of their job yet temporarily finding themselves a community.

To create out of such simple materials and means a shapely and invigorating work of art is a remarkable achievement.

Cromwell. 1973.

In a play which took shape in 1968–9, a time of conflict in Vietnam and Ireland, Storey abandons naturalism for a kind of dramatic fable, where brief, swiftly-moving scenes, occasionally using some verse, depict "people wandering through woods and a war". Although Cromwell is never mentioned the setting suggests the Ireland of his time.

Amid the refugees, rigid partisans and turncoats of a confused guerrilla war, the protagonist Proctor emerges as a man of principle, constantly searching for the right course of action. Two amiable Irish layabouts, shameless opportunists, serve as a foil to Proctor and their comic lackadaisical backchat acts as cynical running commentary on his devotion to ideals. He is fighting on behalf of dispossessed Catholics but disillusioned by the futility of inconclusive reprisals he withdraws from war, marries Joan and finds deep satisfaction in restoring her ravaged farm. Then, because he gives shelter to some wounded anarchist Levellers the farm is devastated a second time by the Protestants and their child killed.

After bitter heart searching, Proctor finally eschews all political and social ideology and in a final scene a boatman ferries him and Joan across a river. Storey says that the scene indicates "just the transference from one kind of life to another", although it may be interpreted both literally and also symbolically as purification and absolution.

Storey's theme is the irrelevance of theoretical and political standpoints and he has said that "it has become immaterial which side you choose to be on". Yet the value of integrity is stressed as paramount and the boatman significantly refuses to carry the layabouts, who "hang like leeches", for "hands which always receive can offer nought".

An interesting play of ideas suffers from structural imbalance, for there is an extremely long and leisurely first act while Proctor's deepest conflicts are hurried into brief and rather obscure final scenes. There are literary echoes from Dante and Bunyan but Storey says Shakespeare is his only model.

The Farm. 1973.

The play reverts to the realistic style of *In Celebration*. It is dominated by the rough Yorkshire farmer, Slattery, who after a dangerous stroke still drinks inordinately.

After a lifetime of toil he is angered and bewildered by the sterility of his offspring. Three daughters still live at home. Two are teachers in their thirties, Wendy early separated from her husband and Jenny restlessly seeking one, while Brenda, aged twenty-three, a fierce and naive subvertionist, is still supported by her father. Slattery is passionately scornful of the son Arthur, a poet manqué, idolised by his mother. Now twenty-one, he has left home and drifts impecuniously from job to job.

One night Wendy finds that Arthur has returned unexpectedly. He is shaking with apprehension and next morning tells his father he is about to marry Alison, a divorced woman of forty-two. Slattery, incredulous and furious, lashes him with invective yet agrees to receive Alison that evening. But Arthur's courage fails and he arrives late and alone. Slattery's paroxysm of rage is such that he almost collapses and during the night the despondent Arthur leaves as unobtrusively as he had come.

Next morning a brief final scene shows Slattery genially welcoming to the breakfast table Brenda's diffident suitor, who has at last found courage to come openly to the house.

The play is looser in texture than *In Celebration* and the portrayal of the sisters rather flat and repetitive. But the frustration of their unfulfilled lives is peripheral, although probably steming from the mutually destructive relationship between father, mother and son. Slattery gradually betrays his misery that his wife has withheld from him the love she has lavished on Arthur and in his final outburst he even accuses his son of trying to supplant him by deliberately contriving an emotional shock that will cause his death. Storey's compassionate presentation of this Œdipal situation is powerful and moving.

Peter Terson (b. 1932).

Terson is a prolific writer, with a talent for fertile, fluent dialogue, which immediately establishes personalities and relationships. His most successful work has been done in active co-operation with two directors, Cheeseman and Croft.

In 1963, while working as a games master in the Vale of Evesham, Terson first contacted Cheeseman, director at Stoke-on-Trent, whose policy it is to find writers rather than plays, and through his encouragement and suggestions Terson wrote several plays located in the Vale. A recurrent theme of these is the mysterious power of nature as opposed to urban sophistication, and as in Rudkind's *Afore Night Come* (*q.v.*), a sinister theme often runs through them.

The Evesham plays include *A Night to Make the Angels Weep*, 1963, *The Mighty Reservoy*, 1964, P, *I'm in Charge of These Ruins*, 1966, *All Honour Mr. Todd*, 1966, and *Mooney and His Caravans*, 1967, P.

Recently Cheeseman has produced plays which break new ground and whose first drafts had been written at an earlier date. Most notable are *The Samaritan*, 1971 (begun 1968) and *But Fred Freud is Dead*, 1972 (written 1964). Both plays, which should now reach a wider audience, involve a sympathetic and wittily accurate picture of a man who feels emotionally insecure and inferior and who finds over-compensation in a false bravura.

Cheeseman rightly considers Terson's greatest gift is "his capacity to write in a way that is both very funny and profoundly serious at the same time."

Terson became known nationally through his remarkable collaboration with Michael Croft, director of the N.Y.T. For *Zigger Zagger* (P) there was only a "fragmentary script" which was built up on stage by Terson, Croft, and the actors. Even *The Apprentices* (P), which began with a clear line of development, was considerably modified during rehearsal when Terson feels stimulated by the reactions of director and actors.

He writes about youngsters with affectionate zest and exuberant humour, vividly aware of the lack of opportunity offered by modern society to the younger school-leaver.

Zigger Zagger. 1967. P.

Dominating the play is a remarkable manipulation of a youthful football crowd which acts as a living backcloth to the scene. Harry, school-leaver and near-delinquent, is so possessed by its Dionysiac frenzy that he is opaque to all efforts of authoritative figures such as the youth officer and respectable relatives to gear him into a job. Eventually grudgingly accepting life's economic demands, he becomes an apprentice.

The Apprentices. 1968. P.

During mid-day breaks in a factory yard, crowded and animated as a Breughel, overalled apprentices play football, fight, flirt, and wrangle. The flurried foreman and older hands, caustic yet tolerant, act as foil.

The chief personalities are vividly presented in the round. In the centre is the derisive, irrepressible Bagley, priding himself on his "rebel's instinct," kindly at heart, yet an enthusiast for the barbarous "initiation" ritual. But the progress of events leaves him stranded. Led by the studious Geoff, his fellows, including Harry, are gaining qualifications and getting on and out. The factory, modernised, will need brains not muscle and all have lost interest in the "initiation". Bagley, a married man at 18, his wife already pregnant after a brief holiday encounter, ruefully drifts towards the older fitters he had despised.

Fuzz, 1969.

The crowd techniques of the N.Y.T. were again deployed in a lively dramatising of student protest movements, but students' own lack of a positive, unifying purpose became reflected in the play itself.

Spring-Heeled Jack. 1970.

The setting for another N.Y.T. play, now directed by Barrie Rutter, is the rowdy yard of a crowded block of council flats. Lop, just back from prison for petty larceny, finds scant sympathy from the noisy, mixed population. He becomes suspected of murdering an old tramp and in the mounting hysteria he is identified with the mythical terrorist and voyeur, Spring-Heeled Jack. Only the intervention of a sympathetic Negro saves him.

The central momentum of the play tends to be dissipated in extraneous currents of action and farcical episodes.

Good Lads at Heart. 1971.

The fifth and one of the most successful of Terson's plays for the N.Y.T. is set in a "community home" (formerly called approved school) and was actually vetted by old boys and teachers, who "toughened the whole thing up."

Trevor Hunter, a progressive drama teacher with his assistant Gillian takes a group of 20 boys in imaginative improvisation, although harried by the disapproving gym master, Hardacre, a rigid disciplinarian. Trevor uses as a framework a modernised "Rake's Progress," but the boys become alarmingly out-of-hand and can be quelled only by the intervention of the Head Master.

Although Trevor is the more sympathetic personality, the conflict of modern and traditional concepts of education is presented with fairness and the play is eloquent and exciting, both in the dynamic activity of the group and the swift emergence of sharply realised personalities, whether staff or delinquent pupils.

Geordie's March. 1973.

A play for the National Youth Theatre recalls the famous Jarrow March of the 1930s.

After a fatal accident among the apprentices in a Sunderland shipyard Geordie leads a group of fellow apprentices on a protest march to London to publicise their need for some participation in industry. They suffer unexpected setbacks. When hoping for shelter for the night from a working men's club, they are hurried off the stage to make way for a strip show. A farmer exploits their labour. Tired and footsore the boys begin to quarrel among themselves and the one communist waits to oust Geordie as leader. A sensationalist journalist who has comfortably followed them by car distorts their cause (the media follow suit) and politicians exploit it.

Geordie finds himself deserted by all but Ned whom his companions had ostracised as a hippy but he alone remains faithful to their ideals.

The choice of a journey as subject gives the play the episodic structure of the adventure story. The central drama is to be found in the squabbles within the group and the boys' inner conflicts as they react variously to external pressures.

Jose Triana (b. 1931).

Triana, born in Cuba, spent four years in Madrid but returned to Cuba after Castro's revolution and has now written several plays.

The Criminals. 1967.

The first Cuban play staged here depicts three adults, a brother and his two sisters, acting out fantasies of childhood, hatred of thwarting parents, and the tyranny of home, which culminate in a frenzied ritual of their murder of the parents at the end of Act One. The trial of the children in Act Two gradually develops into an enactment of the parents' mutual detestation. As the curtain falls the ritual begins afresh.

This intense play, in the genre of "Theatre of Cruelty" (*q.v.*), has less wealth of imagery than Weiss's *Marat-Sade* but a greater universality of reference than Genet's world of criminals and perverts. It may have been influenced by the work of Arrabal.

Triana shows great psychological insight; children's play is often a dramatic projection of their inner anxieties and conflicts and at all ages the sterile process of fantasy gives only temporary relief and must be endlessly and exhaustingly repeated. The most significant moment of the play is when the word "love" is timidly offered as an alternative only to be rejected.

An extremely apt parallel to Triana's vision was the contemporary Keith lecture (26 Nov. 1967), when Dr. Leach, the social anthropologist, criticised our unthinking acceptance of the inward turning type of family life, where "The parents fight: the children rebel." Of such a family Dr. Leach said, "The strain is greater than most of us can bear," and he considered it to be the source of our social discontents.

Triana's play effectively shows it as a potent source of man's aggression. Some critics have seen in it implications of Castro's resistance to the dominance of America.

Boris Vian (1920–59).

The French Vian was influenced by the Absurdist approach of Ionesco.

The Empire Builders. 1962.

Man's futile flight from death is imaged in a family trying to escape from a terrifying noise by moving up to a higher and higher floor and meaner quarters. Eventually the father alone reaches the attic, where he dies.

The Generals' Tea Party. 1966. P.

Written in 1951, Vian's biting, absurdist satire on the military mentality represents his general behaving like a small boy, afraid of Mama, and asking his playfellows—other generals—to tea. After deciding that war would be a nice idea, they then select the target—prophetically Algeria.

Roger Vitrac (1899–1952).

The French Vitrac, an associate of Artaud, attempted Surrealist plays which anticipate the Theatre of the Absurd. His *Victor* was produced in 1964.

Frank Wedekind (1864–1918).

The plays of the German Wedekind, a passionate amoralist, are preoccupied with the mysterious power of sex and in their intensity they sporadically break through the bounds of realism into fantasy and symbolism—techniques later to be deployed, although to different ends, in Expressionism (*q.v.*).

Spring Awakening. 1863.

Published in 1891, the play which concerns the lyrical rapture and the agony of puberty, is a fervid indictment of a disastrous and repressive "morality," of secretive or hypocritical parents and grotesquely tyrannical schoolmasters.

Finally in a scene of nightmare fantasy, the ruined adolescent, Melchior, searching for the grave of his sweetheart, dead through an abortion, is encountered by the ghost of his suicide friend

and is himself only restrained from the same fate by the symbolic Man in the Mask.

Lulu. 1970.

Lulu is the title given by Peter Barnes to his adaptation of two plays, *Earth Spirit*, 1895, and its sequel *Pandora's Box*, 1903. Barnes's version keeps to the basic substance if not to the spirit of the original.

Wedekind's protagonist, Lulu, the incarnation of the instinctual life, symbolises sexual passion in its beauty, rapture, and terror. In her narcissism and uninhibited passion she destroys all who become hopelessly infatuated with her, unbridled erotic fantasy alternating with horror and the grotesque.

In Barnes's Act I, corresponding to *Earth Spirit*, Lulu causes the death of her first husband by shock, the suicide of the second, and shoots the third, Schön.

In Act II, the sequel, she gradually degenerates to amateur prostitute, still adored by two ruined devotees. a lesbian countess and Schön's son. To him she has been successively foster-sister, step-mother, and mistress, the incarnation of a Freudian dream. These two also die and she is herself assassinated by a pervert casual client, Jack the Ripper.

Barnes's adaptation neglects the mystery and pathos of the original. The characters are presented flat. Only the countess and Schön's son are a little more than two-dimensional and so excite some sympathy. Fantasy and horror are abruptly succeeded by grotesque bathos in the modish spirit of black comedy (*q.v.*).

Peter Weiss (b. 1916).

The German-speaking Weiss has adopted Swedish nationality and Marxist doctrine.

The "Marat Sade." 1964.

The full title of this verse play, one of the most impressive exemplifications of Artaud's Theatre of Cruelty, is *The Persecution and Assassination of Jean-Paul Marat as Performed by the Inmates of the Asylum of Charenton under the Direction of the Marquis de Sade!* As the title indicates this complex work operates on receding planes of cruelty, thus exciting in the audience that vivid experience of violence which is the aim of Artaud.

Artaud's demand for primitive ritual which shall exorcise repressed fantasy is met by Corday's threefold visit and murder of Marat and also by the lunatics' frenzied miming of the ceremony of the guillotine—a background motif to the whole play. The use of pantomime and gesticulation on the open stage satisfy Artaud's demands for spectacle, for "poetry in space."

Peter Brook pointed out that these elements are not inconsistent with a Brechtian "alienation"—achieved by the device of a play within a play, the protesting comments of the director of the asylum, the intellectual debates between Sade and Marat and the ribald songs of a grotesque quartet of zanies. The effect is an inextricable blend of the comic and the violent.

The Investigation. 1965.

A documentary of the Frankfurt War Crime Trials, edited by Weiss, had a multiple première in East and West Germany and at the Aldwych. Described by Weiss as an "Oratorio in 11 Cantos," after Dante's *Inferno*, it indicts the millions, including the German monopoly capitalists, who tacitly supported the Nazi atrocities.

At the first impact the grisly facts leave an overwhelming impression of horror. It is remarkable that the author's restraint and dignity in presenting them and the formal austerity of his design have in retrospect the effect of catharsis.

The Song of the Lusitanian Bogey. 1969.

A passionate indictment of Portuguese colonial exploitation and oppression of Angola recalls in some of its techniques Peter Brook's *US*. It was splendidly acted by the New York Negro Ensemble.

Arnold Wesker (b. 1932).

Wesker, son of a Jewish-Hungarian father and a Russian mother, first became a chef, and worked in Norwich, London, and Paris, before taking a six months' course at the London School of Film Technique, where he wrote his first play.

Wesker is an adventurous writer, an innovator in this country of Naturalism, the style used for the *Chicken Soup* Trilogy, with its vivid portrayal of an East End Jewish family and of a farm labourer's family in Norfolk. Later in *Chips with Everything* he tried a more stylised manner, similar in some ways to Expressionism, and later employed with assurance in *Their Very Own and Golden City*.

Wesker is passionately committed to socialism and essentially a didactic writer. This naturally invites unsympathetic comment from those who do not hold the same views and since it is in any case particularly difficult to make an unbiased critical estimate of plays where the ideology and content are inseparable, his critics have to make a special effort to distinguish between sincere idealism and aesthetic quality.

He has sometimes been misrepresented as a naive optimist sadly disillusioned by the progress of events, but he has always represented the inevitable tension between devotion to the ideal society based on social justice, honest craftsmanship and a shared culture and the sober appraisal of the practical difficulties inevitable in realising such an ideal. His idealistic protagonists, Ronnie, Dave, Pip and Andrew Cobham, all exemplify this dichotomy and Wesker himself is the most trenchant critic of these divided personalities, for although deeply committed he is no facile propagandist.

His characters in general are presented in the round, living, aspiring and erring so that they achieve an independent existence, especially the women. He did not at first entirely detach himself from such personalities as Ronnie and Pip, somehow conveying his personal reaction to them, a mixture of affection and exasperation, but in Andrew Cobham he paints a splendidly objective portrait. His hold on dramatic structure is erratic but he sometimes evinces an exhilarating sense of movement on the stage.

Wesker's chief weakness is his diction, a failure to cultivate that gift for words which is apparent in plays such as *Roots*, *Chips* and *Golden City*. Here the use of a regional or R.A.F. idiom has necessitated a disciplined observation and selection and the dialogue is most often effective where it is laconic, incisive, brusque. Wesker usually conveys most when he talks least. To record the voluble expansive converse of Jewish people is all too easy for him apparently, but reportage is not enough and he makes insufficient effort to curtail or reshape the flow so that the prolixities and repetitions while true to life, can be like life itself, boring and monotonous. His characters are too much given to voicing their emotions and aspirations directly instead of through action, which makes for a gushing sentimentality which dissipates the force of the play and significant cross references and clues may be drowned in a garrulous flood.

After 1962 he devoted much time and energy to the founding of Centre 42, which was designed to bring good art and theatre to those otherwise lacking opportunity. He faced many disappointments, and as a member of a race where even the poorer have valued learning and culture, often only obtainable through the discipline of self-education, it has been particularly difficult for him to accept not so much the limitation of privilege to the fortunate as the apathy of some workers who are easily deflected by cheap commercial substitutes.

Glenda Leeming and Simon Trussler have recently published an interesting and detailed study, *The Plays of Arnold Wesker*, Gollancz, 1971.

The Trilogy—The trilogy consists of three naturalistic plays in which a discursive history of the Jewish family, the Kahns, is fused with political debate on the course of socialism.

Chicken Soup with Barley. 1958. P.

This is the springboard of the trilogy. It opens on October 4, 1936, the morning of Mosley's attempted march through the East End of London, when the curtain rises on the basement flat of the Kahns, a Jewish family dedicated to socialist activities. It is 1957 when the play ends with the disillusion of the son, Ronnie, at the Russian occupation of Hungary.

Each of the Kahns is a live human being, presented not for moral judgment but with sympathy. Especially commanding is the mother Sarah. What Jung might call an "extraverted feeling type," she is ignorant of events, contemptuous of books, a strenuous mother figure, and yet in her aggressive dynamic the most masculine person of the group, in contrast to her amiable but shiftless husband, Harry, and the vacillating Ronnie.

The central theme of the play is the conflict between attitudes of mind, "caring," or concern for the welfare of others, and indifference to it. The battle is fought on two fronts, in the home and politically, it being taken for granted that socialism is an expression of "caring." The stalwart Sarah is the centre of the two-fold conflict, for she attacks both social inertia and that of her husband and son.

Structurally the play is sprawling, but Wesker already shows his intuitive sense of theatrical movement. At the end of Scene I there is an exhilarating leap forward as the little band of fighters surges from the basement to the light. A more experienced dramatist might have placed such a triumphal movement as the final climax, but the general pattern of the play is of recoil and listlessness, held only by Sarah's unshakeable faith in caring and Ronnie's honesty with himself.

Roots. 1959. P.

There is here a skilful shift of scene to Norfolk, where Beatie Bryant (Joan Plowright), a farm-labourer's daughter on holiday from London, revisits her family. Beatie is engaged to Ronnie, who has for three years been trying to educate her, especially in the arts and in the intelligent use of words (the "bridges" of communication). She has ignored his advice but endlessly parrots his sayings to her phlegmatic family.

Preoccupied with the primal necessities of life the Bryants are the coarse "roots" from which Beatie has sprung. In spite of a rough friendliness they are ignorant, prejudiced, stubborn, and above all inarticulate.

When on the day appointed for his visit, Ronnie sends instead a letter saying their marriage would not work, Beatie is at last galvanised by shock into finding thoughts and words of her own. These folk she realises are without spiritual roots or standards. Then comes her ecstatic moment of self-realisation. She is at last thinking and speaking for herself.

Although he does not know it Ronnie has realised his ambition, "to save someone from the fire."

The play is well constructed, the characters and dialogue are convincing, Beatie delightful. The ideas discussed about "roots" and "bridges," develop organically from the situation.

I'm Talking about Jerusalem. 1960. P.

In 1946 the Kahns' daughter and her husband, Dave, settle in Norfolk to put into practice the theories of William Morris, but Dave, finding that his hand-made furniture cannot compete economically with the factory product, faces their failure and in 1959 they return to London.

The theme of disillusion is here fully analysed by the voluble Kahns, but the mood escapes despair and Dave's self-respect and sober appraisal of unpalatable facts is contrasted with the embittered cynicism of a friend.

The play is weak structurally. There is insufficient action and Dave is not a sufficiently commanding figure to hold things together. Then the intimate study of tender family relationships, suitable to a novel, is embarrassing, except for brief moments on the public stage.

Two symbolic moments in Act II indicate that Wesker was realising the limitations of realism. One is the miming of a simple ritual of reconciliation, the other a ritual enactment of the story of creation.

The Trilogy as a Whole—Wesker's trilogy throws up vital questions of good and evil, both personal and social, the chief perhaps being that of heredity. Must Ronnie and Beatie inherit their parents' limitations? Is Mrs. Bryant right when she says, "The apple don't fall far from the tree"? Is man foredoomed and his struggle vain? Ironically it is the undependable Harry who suggests that giving people some love may help them to change, while of socialism he says, "It'll purify itself." Who was right and in what degree?

The Kitchen. 1959. P.

In a two-acter, Wesker draws on his experience as a chef to give a vivid impression of a day in the kitchen of Marango's restaurant. The play is notable for its skilful contrasts in pace and movement. The quiet morning quickens to a frenzy of anxiety at lunch-time, and the doldrums of the afternoon are succeeded by the sudden outburst of a German who goes beserk.

The swirling vortex is an image of the blind activity of society, and, while avoiding the rigidity of allegory, Wesker clearly indicates that the kitchen is a microcosm of the world, where men with their casual contacts find themselves in a situation beyond their grasp. The play ends with the dramatic irony of Marango's failure to perceive that work and food alone cannot satisfy man's desires.

Although it destroyed the claustrophobic atmosphere the film version caught very well the movement of the play.

Chips with Everything. 1962. P.

In *R.U.R.* (*Rossum's Universal Robots*) the Expressionist playwright, Karel Capek, used robots as dramatis personae. In *Chips with Everything* Wesker illustrates the process whereby military discipline can reduce individuals to a robot-like uniformity, both the complacency of authority and the inertia of the ranks.

A squad of nine R.A.F. conscripts is subjected to a battery of bullying abuse from the corporal and psychological manipulation by the commissioned officers, until, their personal identity submerged, they learn to move as one mechanical unit and pass out to the blaring of a military band playing "God Save the Queen."

Wesker employs a new stylised and streamlined technique, which shares many of the characteristics of Expressionism and is particularly appropriate to his purpose. Type characters are used to present elements in society—the best example being Corporal Hill—and the identity of the recruits is, with two exceptions, indicated very lightly. The dialogue is for the most part staccato, while brief, stylised, symbolic scenes, such as the square bashing and bayonet practice, succeed one another rapidly, a triumphant instance of Wesker's innate command of stage movement.

As to the two recruits presented in greater detail: the plight of the gentle Smiler, broken and suffering, is sufficiently generalised to give pathos and depth to the play without disturbing its tone, but the predicament of Thompson is treated with too much psychological detail to be in key, especially as the portrait is not entirely convincing.

The son of a general, Thompson is at first resistant to authority and appears to be trying to assume leadership of the squad. But the habits of a class that can eat "chips with everything" are too distasteful for him, and accused by the recruits of "slumming" and assailed by the blandishments of the officers, he suddenly capitulates and assumes officer's uniform.

The overall effect is tense and powerful, and scenes of moving comedy, such as the breath-taking mime of stealing coke, alternate with those where the audience, facing the same direction as the recruits themselves, cannot escape feeling the obliterating effects of the military machine.

The Four Seasons. 1965. P.

In *The Four Seasons* Wesker deliberately set out to re-create a love relationship while ignoring "any recognisable social context." In this he

felt constrained to justify the presentation of private pain against an extreme socialist view that "it can have no relevance in a society where man's real tragedies are bound inextricably with his social environment".

He has limited himself to two characters, a man and a woman whose previous marriages have foundered and who live together from winter to the following autumn. The names Adam and Beatrice are archetypal, the season suggests a universal cycle and the old house and garden are indicated only symbolically. But Wesker is attempting the impossible in applying what are Expressionist devices to a static situation almost devoid of plot or incident and relying on lyrical exchanges of love and ultimately of alienation. Even the final quarrel is too unmotivated to be convincing.

It is fruitful to contrast Whitehead's *Alpha Beta*, where the gradual collapse of marriage is conveyed with frightening intensity through an intimate portrait of two sharply drawn individuals in a precisely observed working-class home.

Their Very Own and Golden City. 1966. P.

The driving force of a vigorous play which won the Marzotto prize in 1964 is probably Wesker's own frustrated struggle to realise a communal and artistic ideal in Centre 42, which was intended to make good art and theatre easily available to the people.

The opening dream-like scene in Durham Cathedral in 1926 shows Andrew Cobham and fellow apprentices, together with Jessie his future wife, when Andy is so exhilarated by the soaring splendour that he is inspired to his life work as architect. This seminal experience is flashed forward and developed in the early part of the play as if refreshing and nurturing his vision of the twelve Golden Cities he becomes inspired to design, where the centre or heart shall be not the Town Hall but museums, art galleries and theatres, so as to set a new pattern of living for the community.

When he is already married, a girl of aristocratic descent befriends him and holds him determinedly to his purpose. Future householders enthusiastically finance the buildings for one city but Andy is so frustrated by ten years of fruitless waiting for the T.U.C. to finance industry that he yields to Kate's persuasion and compromises his principles by accepting support from a Tory minister and a capitalist industrialist.

Similarly Andy's private life is jeopardised. His platonic friendship with Kate brings emotional fulfilment to neither and he gradually becomes estranged from Jessie, impatiently referred to by Kate as his "housekeeper".

Eventually knighted and a member of the Establishment, he is seen a cantankerous old man playing bridge with his three influential friends while Jessie sits and sews.

A final scene is a sad ironic flash-back to the Cathedral, where the youngsters find themselves locked in until one discovers one door still open, symbolic perhaps of Wesker's fears and persistent hope.

Wesker ably portrays the dilemma of the socialist artist caught between an obscurantist labour movement unawakened to cultural values and a privileged Establishment which fosters them.

He has used with assurance the technique he had worked out in *Chips*, successfully integrating an Expressionist panorama of social trends with the creation of convincing characters, who although typical of elements in society are seldom merely types. The idiosyncracies of minor characters are swiftly etched in by brief dialogue while those at the heart of the play are realised in depth, the protagonist with controlled passion and his gradual deterioration movingly portrayed.

In spite of some mawkish phrases in the Cathedral scenes and some inordinately long political speeches, not always relevant, the dialogue is for the most part sharp and incisive and is sufficiently distanced and controlled to be unusually effective.

The Friends. 1970.

Her brother, lover, and friends surround Esther's deathbed. Of Jewish working-class origin, they have become affluent and cultured but have lost direction. Disillusion as to the workers' capacity for culture is a theme adumbrated but not clarified. The situation is static and the dialogue often embarrassingly introverted and self-conscious.

The Old Ones. 1972.

A kaleidoscopic play with seven contrasting settings, demanding a revolving stage, shows an ageing Jewish family and their friends.

At the centre is a triangular pattern of contrasts. The seventy-year-old tailor, Manny, and his younger brother, Boomy, living in Manny's house, constantly challenge each other with learned quotations. Although he is now suffering an agonising depression Manny's citations are optimistic, beginning with Yeats's "All things fall and are built again/And those that build them again are gay," words adumbrating the play's main theme. Boomy, a "catastrophe-monger," concentrates on *Ecclesiastes*. Meanwhile their cheerful sister Sarah, in her council flat, prepares for "Succoth," the Jewish harvest festival.

"Defiant old age," Wesker's avowed subject, is reflected in Manny's much-tried wife and in two old women, picturesque eccentrics. All are Jewish and described as "pellets of steel" by their Cockney friend Jack, who assumes the rôle of moral leper, complete with bell—an effective contrast to the rest.

In the final scene all gather at Sarah's and with her daughter and nephew try to enact the half-forgotten Succoth ritual of "merriment and rejoicing." Here Manny regains confidence and joy. This climax is an instance of Wesker's individual use of stage movement.

This picturesque play is much more extroverted and successful than *The Friends*. Its form is appropriately loose and episodic but significant relationships are not sufficiently explored, for the stage is cluttered with minor characters, all parroting their emotions and sentiments, and there is little dramatic confrontation.

E. A. Whitehead.

Whitehead, who later won a scholarship to Cambridge, spent his Catholic childhood in one of the poorest parts of Liverpool. He sets his plays in that vicinity, and explores with unsparing realism the bigoted and harsh culture of working-class people, who are so crippled by their environment, that Alf Garnett, he says, is no caricature. Whitehead also conveys his conviction that, although our society is in transition, the relationship between the sexes is cramped by a rigid convention, and that alternative and varying patterns of mating and breeding should now be found.

The plays within their narrow canvas have a stark sincerity and intensity but the limited and repetitive verbal idiom can become monotonous.

The Foursome. 1971. F.

Two youths take two girls they have successfully picked up the previous evening to a sandy hollow of the beach but they are sexually frustrated and infuriated by the girls' sham reluctance. The dialogue of the men's bawdy taunts and the girls' prurient and prudish repartee is seldom relieved.

Alpha Beta. 1972. F.

A vigorous two-character play spanning nine years shows a working-class married couple in their thirties suffering the inexorable collapse of their marriage. Frank (Albert Finney) feeling trapped by convention and children, Nora grimly refusing divorce, they quarrel bitterly and fight physically, until both are worn down. Finally Frank, now 38, can envisage divorce and freedom in two years time under the new Act. Nora sardonically asks, "Free for what?"

John Whiting (1915–63).

John Whiting was an original playwright who was much preoccupied with the theme of self-destruction, but was slow to find his own style.

A Penny for a Song. 1951.

Written at a time of great personal happiness this is an agreeable whimsy, depicting two eccentric brothers in their Dorsetshire residence pre-

paring to repel the armies of Napoleon. The appearance on the stage of a balloon and a home-made fire-engine give the authentic period touch of gentlemanly interest in scientific invention, and also impart to the farcical idyll a dash of panto-mime.

Whiting cleverly gives a comic perspective to the recent fear of foreign invasion and so takes the sting out of terror.

Saint's Day. 1951.

This play, written before *A Penny for a Song*, won the award in a Festival of Britain Play Competition.

It concerns self-destruction, its central figure being the octogenarian Paul Southman, once a famous revolutionary poet who had long ago gone into self-imposed exile because of popular outcry against his work.

The plays opens well. Southman is a striking figure, an embodiment of the angry artist at war with society, and like Swift in his aggressive scorn of compromise, his scurrilous style and final madness. His situation is at first sufficiently distanced to be convincing, but when the fashion-able young writer Procathren introduces the glossy contemporary world it begins to seem implausible. Later Procathren accidentally kills Paul's grand-daughter, Stella, and then orders three deserting soldiers to hang Paul and Stella's husband, also an artist, and the initially powerful theme is swamped by melodrama.

The play generally is overloaded with half-developed symbolism and allusion.

Marching Song. 1954. P.

In a play much concerned with the existentia-list stress on the inescapability of choice, Whiting returns to the theme of self-destruction.

The setting is generalised—a wealthy house "above a capital city in Europe." Rupert Forster, formerly a general, who seven years previously had inexplicably lost a decisive battle, here meets his dilemma. He must either face a trial, which might cause political unrest, or com-mit suicide. The choices are represented by two people.

In Act II Forster encounters Dido, a young woman who revives his sense of humanity and will to live. She represents the female side of personality, the Jungian anima and her name recalls the Dido of the Æneid, who by her love deflected Æneas from the path of military duty enjoined by fate.

In Act III he has a very different meeting with Captain Bruno, the embodiment of military ambi-tion, who represents the male aspect of personality. To him Forster at last confesses the cause of his fatal defeat. He had been so overcome with compassion for children whom he had destroyed while they were impeding his tanks that he had been unable to follow up his advance. Bruno stigmatises the delay as military error and guilt and Forster commits suicide rather than face disgrace and imprisonment.

This is a strongly constructed play, its dominat-ing theme worked out with single-minded aus-terity. But it lacks thrust and momentum. Forster's reversion to his original decision to commit suicide gives it a circular movement and it is more concerned to clarify judgment of the past than to affect the future. In its acknow-ledgment of the discrepancy between military code and humane ethic it is highly topical and stimu-lating.

The Devils. 1962. P.

Suggested to Whiting by Peter Brook, this intricate and distinguished play is based on Aldous Huxley's *The Devils of Loudun*, which treats of an actual case of suspected diabolism in France between 1623 and 1634.

Whiting employs two focal points. One is Grandier (Richard Johnson), again a man who invites his own destruction, a worldly and sensual priest who is yet gifted with a rare religious in-sight and compassion. The other is a hunchback prioress (Dorothy Tutin). Although she has not met Grandier, she becomes obsessed by fantasies of his amorous adventures and her resulting hysteria, which spreads throughout the convent. is suspected as diabolical possession, instigated by Grandier. Richelieu, for political reasons, uses this as a pretext to get rid of him. Grandier, in spite of excruciating torture and degradation, the prelude to his being burnt alive, struggles to retain his faith.

In its subject and theme *The Devils* is strikingly similar to Miller's *The Crucible*. Both plays show *l'homme moyen sensuel* accused of diabolism and beset by a woman's jealousy, fanatical super-stition, and malignant spite, yet still keeping his integrity in the face of death.

There are significant differences. Whiting's intricate play is not realistic but Brechtian in style, with a series of brief episodes and a com-mentary by a sewerman, whose ironic and sceptical remarks counterpoint Grandier's elo-quence. It lacks Miller's reference to the con-temporary scene and its final note is one of harsh pessimism, as the sewerman tells the prioress that Grandier's bones are being prized by the crowd as superstitious "charms."

The final act presents an almost unbearable spectacle of a barbarous ritual of physical torture as the maimed and twitching Grandier is paraded in public procession through the streets.

Tennessee Williams (b. 1914).

The American Tennessee Williams is a play-wright of great talent, whose freely flowing naturalistic plays combine violence and melo-drama with haunting portrayal of personality, fluent dialogue, and original settings.

Of recent years the following major plays have been produced in Britain: *The Glass Menagerie*, 1948, revived 1965 (P); *A Street Car Named Desire*, 1949 (P); *The Rose Tattoo* (P); *Cat on a Hot Tin Roof* (P); *Camino Real*, the least realistic play, 1957 (P); *Suddenly Last Summer* (P), *Period of Adjustment*, 1961, and *The Two-Character Play*, 1967.

Although his plays breathe the atmosphere of the Deep South—often decadent in tone—Wil-liams, unlike the extravert Miller, is preoccupied not with social issues but with the inner life of his characters. Compelled by their own passions and obsessions and caught in the web of family relationships, they break away only at great cost and pain to themselves and others, so that a mood of determinism, sombre but not altogether despairing, broods over much of Williams's work.

He portrays the vulnerability of those who desire or love anything intensely, humanity's sense of guilt, defiant aggression and despair, all of which he claims to find within himself. The violence characterising so much of his work reaches its climax in *Suddenly Last Summer*.

Especially poignant are Williams's penetrating psychological studies of life's pathetic failures; the crippled Laura retreating to her glass men-agerie, Blanche Dubois, of *Street Car*, and the alcoholic Brick and his childless wife in the *Cat*.

The Two Character Play. 1967.

Like the early *The Glass Menagerie*, the play treats of an ill-omened brother–sister relationship.

Believing them to be mad, the cast of a touring theatrical company have just deserted the two star actors, a brother and sister, Felice and Clare. Alone on the stage, the pair hysterically decide to put on Felice's own work, *The Two Character Play*. This play within the play is also about a brother and sister who stay immured in an overgrown house in their terror of facing the world outside. Their father had killed their mother and then committed suicide and people now suspect the brother–sister relationship. Whether it is the relationship of Felice and Clare or of the dramatic personae is left ambiguous in a Pirandello-like piece hovering on the confines of reality and illusion, sanity, and madness.

Small Craft Warnings. 1973.

A foggy evening passes in Monk's bar on the Pacific coast. His customers are life's failures and misfits; a doctor who having lost his licence through drinking now performs illegal operations, Violet, a retarded and destitute nymphomaniac and Steve her impoverished protector, the sensual Bill, who for six months has been supported by

Leona (Elaine Stritch) in her trailer, and a passing homosexual with the boy he has picked up.

The storm centre is Leona, hard-drinking, generous and enterprising. When she discovers that Violet, whom she has befriended, is trying to seduce Bill, she lashes about her in frenzied anger, a whirlwind in this sluggish backwater.

Williams intended that every character should be of equal importance and all reveal their memories and hurts in dream-like soliloquies. The original title of the play was *Confessional.*

The setting and structure is like that of Gorky's *Lower Depths* but without the tragic intensity of that work or of Williams's own earlier work, for he contrives a somewhat facile and sentimental shelving of the human problems. The kindly Monk warns the doctor to get on the road before the police arrive and he wryly befriends the feckless Violet. Only Leona, resolutely discarding Bill, sets out for the next stage of her vagrant life.

Charles Wood (b. 1932).

Born in Germany, Wood came to England when very young. Descended from two generations of actors, he has inside knowledge of the actor's life. He has also been a regular soldier and stage and army are the chief province of his plays, which sometimes assume in the audience some specialist knowledge, as in his first work, the triple bill *Cockade,* 1963, which was concerned with the army. He is skilful in devising for each play a dialogue appropriate to the characters' occupations, period and locality.

Fill the Stage with Happy Hours. 1966. P.

A play set in a tatty provincial theatre is, says Wood, " about theatrical failure " and is interesting as a companion piece to *Veterans.*

The central figure is the Manager's wife who, knowing that she is fatally ill, is distraught by her husband's crude infidelities and the seduction of their only son by an ageing visiting star.

Dingo. 1967. P.

Wood employs Expressionism to present a phantasmagoria of the last War, beginning in the desert and grinding through Stalag to the unconditional surrender of Germany. It is an assault on the emotions and sensations in a passionate attempt to bring home war's physical horror and spiritual attrition, but Wood's specific concern is to expose latent jingoism and political expediency and the futility of the heroism they demand.

The scurrilous words matter less than certain persistent images: the ranker, Dingo, epitome of bitter disillusion; Tanky, rendered simple-minded because he was powerless to release his mate, screaming to death in a flaming tank; an ENSA comedian who serves to parody Churchillian rhetoric, and breezy morale-boosting of High Command; a young subaltern, dressed as a blonde in a bikini for a concert party designed to cover an escape from Stalag, and now, with Tanky, lolling dead from the barbed wire.

The play is powerful but sprawling, cluttered, one-sided. It attacks the idea that Britain played a more disinterested rôle than in previous wars. It was fought, not for others, says Dingo, but " for all the usual reasons," an emotive statement that needs scrutiny.

" H ". 1969. M.

Wood's subject is the heroic march of the elderly General Havelock, or " H," during the Mutiny. His column vastly outnumbered and decimated by disease, he yet relieved Cawnpore and won twelve desperate battles before relieving Lucknow where he died of dysentery.

A devoted and chivalrous Christian and a disciplined commander, Havelock yet ordered some of the terrible reprisals then current, hanging mutinous sepoys or shooting them alive from the mouths of cannon. His equivocal behaviour helps to resolve and focus Wood's own conflicting impulses, his fascination with military discipline and his horror at the bestiality of war, so that the play is more unified than *Dingo.*

The core of the play is irony, centred in the action of the protagonist. But the irony proliferates, as in the contrast between the stylised Victorian language and the brutal deed, and in the many brief unconnected episodes, as, for instance, one recalling the mutual love and sacrifice between British and sepoys. These, demanding a constant reorientation of attitude, tend to distract and confuse.

The fact that Havelock's aide-de-camp is his own son suggests the tender perspective of home. Resolute in courage and obedience, the son differs from his father in opinion and faith and his eventual confession of Christianity at Havelock's death gives pathos to the scene.

The Brechtian epic style is well suited to the simple episodic structure. Brechtian devices are also used:—direct address to the audience, map titles and symbolic emblems, such as the simple blood-stained floor and awning, arrestingly conveying the Indian atrocities at Cawnpore. Brechtian in spirit too is the deliberate theatricality of short scenes projected within a little replica of the popular travelling stage.

Although Havelock on the surface resembles the Brechtian ambiguous protagonist, the chief weakness of the play is that he does not attain the commanding stature of a Galileo or a Mother Courage.

Veterans. 1972. M.

Wood has imagined his own play *H* being filmed in Turkey near the Hellespont and the filming of his screenplay, *The Charge of the Light Brigade,* has given him an authentic background,—" the sun . . . the Turkish cavalry earning a few bob . . . men dressed in uniforms from England's colonial past giving cigarettes to the natives ".

The play is set in or near the small Greek amphitheatre of Prieria and the veterans are two famous actors, Sir Geoffrey Kendle (John Gielgud), who plays Havelock, and d'Orsay (John Mills), in the smaller part of Outram. Sir Geoffrey spends nearly all day waiting in a canvas chair, tired and frustrated. His conversation with his jealous friend d'Orsay and the younger star, Bryan, " a curled young man," is that of the green room but uncovers some of their problems, serious and trivial. The tenuous action consists chiefly in their transient contact with each other, and with the exuberant young director. d'Orsay is early sent off the set for indecent exposure, Bryan walks off in dudgeon and Sir Geoffrey, as he says, " fell off " the rickety rostrum on which he had been directed to climb, only to find that producers and camera crew had all unaccountably vanished, to leave the three actors stranded.

What emerges is a delightful dramatic portrait of Sir Geoffrey, generally believed to represent Gielgud himself, which has been compared with Shaw's portrait of Ellen Terry in *Captain Brassbound's Conversion.* Idioms of speech and personal idiosyncracies are painted in affectionate detail—the unflinching honesty about others at odds with innate courtesy and concern, the *faux pas* hastily withdrawn, above all the integrity and self-effacing modesty of the true artist unconscious of his worth.

The play especially appeals to the cognoscenti of the modern stage but it has another dimension. It is, says Wood, " about the failure of theatrical success " and it comically exposes the absurdities of costly film epics, the lavish expenditure on energy and money on trivialities and the exploitation of the actors' talents. The setting in the Greek theatre is effective visual irony and the presence of tortoises and an eagle occasion reminiscence of the fate of Aeschylus. The final impression is of the futility of a mammoth enterprise that leaves the ancient site littered with indestructible " plastic cups tossed in every ditch, behind every wall " among the Hittite débris.

IDEAS & BELIEFS

This section explains many of the ideas and beliefs that have dominated men's minds during the centuries. The arrangement is alphabetical and the subjects fall broadly into four groups: religious, philosophical, political, and offbeat cults and ideas.

IDEAS AND BELIEFS

THIS section explains many of the ideas and beliefs which people have held at different periods in history. Beliefs may be true or false, meaningful or totally meaningless, regardless of the degree of conviction with which they are held. Since man has been moved to action so often by his beliefs they are worth serious study. The section throws a vivid light on human history.

Man has always felt a deep need for emotional security, a sense of "belonging." This need has found expression in the framing of innumerable religious systems, nearly all of which have been concerned with man's relation to a divine ruling power. In the past people have been accustomed to think of their own religion as true and of all others as false. Latterly we have come to realise that in man's religious strivings there is common ground, for our need in the world today is a morality whereby human beings may live together in harmony.

There is also to be found in man an irresistible curiosity which demands an explanation of the world in which he finds himself. This urge to make the world intelligible takes him into the realm of science where the unknown is the constant challenge. Science is a creative process, always in the making, since the scientist's conjectures are constantly being submitted to severe critical tests. Basic scientific ideas are discussed in Section F.

A

Activists, those in a political movement who insist on taking active steps towards their objectives rather than merely putting forward a programme. Lately activism has become an increasingly common facet of political life. This is probably because the undeniably rapid social changes which are taking place across the world at the moment are not generally being followed by appropriate shifts in political structures and ideals.

Acupuncture, a quasi-medical system originating in China and based on the supposedly therapeutic effects of implanting fine gold needles in the spinal cord and other specific parts of the body. The site of needle implantation is decided according to traditional texts. The apparent lack of any logical relationship between the implantation sites and any known physiological or anatomical systems within the body has caused acupuncture to be held in low regard by Western medicine. Indeed it is certainly true that acupuncture and other similar practices tend to flourish in parts of the world where orthodox medicine has made little progress or where doctors and trained staff are scarce.

Recent years however have seen a curious and unexpected revival of interest in acupuncture in Europe and America, prompted in large part by the considerable press publicity which has surrounded a number of major surgical operations performed without anaesthesia upon human patients and which have been witnessed by sceptical Western specialists. Considerable controversy still surrounds acupuncture and is likely to continue for many years—possibly because it is hard to envisage a theory to explain its effects which is consistent with orthodox medicine. No doubt the immensely powerful effects of suggestion and hypnosis need to be taken into account. Some recent discoveries on the psychology and physiology of pain which show that severe wound pain may be alleviated by electrical stimulation of the nerve endings in the site of the wound may also have some relevance. Whether acupuncture will some day take its place as a legitimate weapon in the clinician's armoury is still open to question. More and more physicians are taking an interest in it, though most of its practitioners have no orthodox medical qualifications. This in principle would seem to be rather unfortunate for the spinal cord is a delicate and vital neural channel, best left alone by anyone not well trained in its anatomy.

Adlerian Psychology. In 1911 the Viennese psychoanalyst Alfred Adler (1870–1937) together with his colleague Carl Gustav Jung broke with their friend Sigmund Freud over disputes concerning the latter's theoretic approach to psychoanalysis. Jung and Adler were themselves shortly also to part company, each to set up and develop his own "school" of psychoanalysis. Adler's system of psychotherapy is based on the idea, not of sex as a driving force as in the case of Freud, but on the concept of "compensation" or a drive for power in an attempt to overcome the "inferiority complex" which he held to be universal in human beings. The child naturally feels inferior to adults, but bullying, making him feel insignificant or guilty or contemptible, even spoiling, which makes him feel important within the family but relatively unimportant outside, increases this feeling. Or the child may have physical defects: he may be small or underweight, have to wear glasses, become lame, be constantly ill, or stupid at school. In these ways he develops a sense of inferiority which for the rest of his life he develops a technique to overcome.

This may be done in several ways: he may try to become capable in the very respects in which he feels incompetent—hence many great orators have originally had speech defects; many painters poor eyesight; many musicians have been partially deaf; like Nietzsche, the weakling, he may write about the superman, or like Sandow, the strong man, be born with poor health.

On the other hand he may overdo his attempt and overcompensate. Hence we have the bully who is really a coward, the small man who is self-assertive to an objectionable degree (Hitler, Napoleon, Stalin, and Mussolini were all small men) or the foreigner who like three of these men wanted to be the hero of their adopted country—Hitler the Austrian, Napoleon the Italian, Stalin the Georgian.

But what about the man who can do none of these things, who continues to fail to compensate? He., says Adler, becomes a neurotic because neurosis is an excuse which means "I could have done so-and-so but . . ." It is the unconscious flight into illness—the desire to be ill. Adler's treatment involves disclosing these subterfuges we play on ourselves so that we can deal with the real situation in a more realistic way. The criticism of Adler's theory is not that it is not true. It is. But it is not the whole truth, for people are much more subtle than Adler gave them credit for: Freud recognised this element of "secondary gain" in neurosis but he knew that there was more to it than that. Nevertheless Adler's method works well in some simpler cases. *See also* Psychoanalysis.

Adventists, a group of American religious sects, the most familiar being the Seventh-Day Adventist Church, which observes Saturday as the true Sabbath. With more than a million members throughout the world, it shares with other Adventists a belief in the imminent second coming of Christ (a doctrine fairly widespread in the U.S.A. during the early decades of the 19th cent, when the end of the world was predicted by William Miller for 1843, then for 1844). Modern Adventists content themselves with the conviction that the "signs" of the Advent are multiplying, the "blessed event" which will solve the world's ills. Believers will be saved, but the sects differ as to whether the unjust will be tortured in hell, annihilated, or merely remain asleep eternally.

Agnosticism. *See* God and Man.

Albigenses, also known as Cathari. French heretical sect (named after the town of Albi in Provence) who appeared in the 11th cent. to challenge the Catholic Church on the way true Christians should lead their lives. They followed a life of extreme asceticism in contrast to the local clergy and their faith was adopted by the mass of the population, especially in Toulouse. Condemned as heretics by Pope Innocent III, the sect was exterminated in the savage Albigensian Crusade (1208–29), initially led by Simon de Montfort. (In his thoroughness, de Montfort also succeeded in destroying the high culture of the Troubadors.)

Alchemy, ancient art associated with magic and astrology in which modern chemistry has its roots. The earliest mention of alchemy comes from ancient Egypt but its later practitioners attributed its origins to such varied sources as the fallen angels of the Bible, to Moses and Aaron, but most commonly to Hermes Trismegistus, often identified with the Egyptian god Thoth, whose knowledge of the divine art was handed down only to the sons of kings (cf. the phrase "hermetically sealed"). Its main object was the transmutation of metals. Egyptian speculation concerning this reached its height during the 6th cent. in the Alexandrian school. Brought to Western Europe by the Moslems, one of its most famous Arab exponents was Jabir (c. 760–c. 815), known to the Latins as Geber, who had a laboratory at Kufa on the Tigris. One school of early Greek philosophy held that there was ultimately only one elemental matter of which everything was composed. Such men as Albertus Magnus (1206–80) and Roger Bacon (1214–94) assumed that, by removing impurities, this *materia prima* could be obtained. Although Bacon's ideas were in many ways ahead of his time, he firmly believed in the philosopher's stone, which could turn base metals into gold, and in an elixir of life which would give eternal youth. Modern science has, of course, shown in its researches into radioactivity the possibility of transmutation of certain elements, but this phenomenon has little bearing on either the methods of the alchemist or the mysteries with which he surrounded them. In line with the current considerable revival of interest in the occult, alchemy appears to be staging a comeback, at least as a literary if not an experimental topic. A largely forgotten book on alchemy by the great, but extraordinarily broad-minded psychologist, Jung, has recently been resurrected and has acquired a new wave of readers and an almost cultish influence.

Anabaptists. *See* Baptists.

Analytical Psychology, the name given by Carl Gustav Jung (1875–1961) of Zürich to his system of psychology which, like Adler's (*see* Adlerian psychology), took its origin from Freud's psychoanalysis from which both diverged in 1911. Briefly, Jung differed from Freud: (1) in believing that the latter had laid too much emphasis on the sexual drive as the basic one in man and replacing it with the concept of *libido* or life energy of which sex forms a part; (2) in his theory of types: men are either extrovert or introvert (*i.e.* their interest is turned primarily outwards to the world or inwards to the self), and they apprehend experience in four main ways, one or other of which is predominant in any given individual—sensing, feeling, thinking, or intuiting; (3) in his belief that the individual's unconscious mind contains not only repressed material which, as Freud maintained, was too unpleasant to be allowed into awareness, but also faculties which had not been allowed to develop—*e.g.*, the emotional side of the too rational man, the feminine side of the too masculine one; (4) in the importance he attaches to the existence of a collective unconscious at a still deeper level which contains traces of ancient ways of thought which mankind has inherited over the centuries. These are the *archetypes* and include vague primitive notions of magic, spirits and witches, birth and death, gods, virgin mothers, resurrection, etc. In the treatment of neuroses Jung believed in the importance of (*a*) the present situation which the patient refuses to face; (*b*) the bringing together of conscious and unconscious and integrating them.

In the 1940s and 50s interest in Jung's ideas waned, at least in academic circles, as the emphasis among experimental psychologists shifted closer and closer to the "hard" scientific line. This was also true in the field of psychoanalysis where the Jungian as opposed to the Freudian point of view became progressively less popular. At the present time this trend is beginning to reverse, and while Jung's offbeat views on astrology, telepathy, etc., are still unfashionable, a reappraisal of the significance of his views on the nature of the unconscious is taking place and many psychologists feel that his contribution to our understanding of the nature of human mental processes has been greatly underated. *See also* Psychoanalysis.

Anarchism, a political philosophy which holds, in the words of the American anarchist Josiah Warren (1798–1874), an early follower of Robert Owen, that "every man should be his own government, his own law, his own church." The idea that governmental interference or even the mere existence of authority is inherently bad is as old as Zeno, the Greek Stoic philosopher, who believed that compulsion perverts the normal nature of man. William Godwin's *Enquiry Concerning Political Justice* (1793) was the first systematic exposition of the doctrine. Godwin (father-in-law of Shelley) claimed that man is by nature sociable, co-operative, rational, and good when given the choice to act freely; that under such conditions men will form voluntary groups to work in complete social harmony. Such groups or communities would be based on equality of income, no state control, no property; this state of affairs would be brought about by rational discussion and persuasion rather than by revolution.

The French economist Proudhon (1809–65) was the first to bring anarchism to the status of a mass movement. In his book *What is Property?* he stated bluntly that "property is theft" and "governments are the scourge of God." He urged the formation of co-operative credit banks where money could be had without interest and goods could be exchanged at cost value at a rate representing the hours of work needed to produce each commodity. Like Godwin, he disapproved of violence but, unlike Marx, disapproved of trades unions as representing organised groups.

In communistic anarchism these ideas were combined with a revolutionary philosophy, primarily by the Russians Michael Bakunin (1814–76) and Peter Kropotkin (1842–1921) who favoured training workers in the technique of "direct action" to overthrow the state by all possible means, including political assassination. In 1868 anarchists joined the First International which broke up a few years later after a bitter struggle between Bakuninists and Marxists. Subsequently small anarchist groups murdered such political figures as Tsar Alexander II of Russia, King Humbert of Italy, Presidents Carnot of France and MacKinley of America, and the Empress Elizabeth of Austria.

Anarchism and communism differ in three main ways: (1) anarchism forms no political party, rejects all relationship with established authority, and regards democratic reform as a setback; (2) communism is against capitalism, anarchism against the state as such; (3) both have the final goal of a classless society, but anarchism rejects the idea of an intermediate period of socialist state control accepted by communism. Philosophical anarchists, such as the American writer Henry David Thoreau (1817–62), were primarily individualists who believed in a return to nature, the non-payment of taxes, and passive resistance to state control; in these respects Thoreau strongly influenced Gandhi as did the Christian anarchist Tolstoy.

Anarchism has traditionally been criticised as being impractical—*e.g.*, in a non-authoritarian society, who is going to look after the sewers or clean the streets?—and there is a good deal of force to this argument. In fact anarchistic ideas became progressively less fashionable in the first half of this century. A curious and probably significant revival of interest has taken

place in the past decade, however, probably because of a growing sense of disillusion, particularly on the part of young people, with the progress of orthodox political systems. *See also* Syndicalism.

Anglicanism, adherence to the doctrine and discipline of the Anglican, as the genuine representative of the Catholic Church. *See* Church of England.

Anglo-Catholicism. To Queen Elizabeth I the Church of England was that of the "middle way" in which human reason and commonsense took their place beside Scripture and Church authority. The extent to which these various factors are stressed creates the distinctions between "high" and "low" church. Anglo-Catholics tend to reject the term "Protestant" and stress the term "Catholic" and, although few accept the infallibility of the Pope, some Anglo-Catholic churches have introduced much or all of the Roman ritual and teach Roman dogmas. *See* Catholicism, Tractarianism.

Animism. To early man and in primitive societies the distinction between animate and inanimate objects was not always obvious—it is not enough to say that living things move and non-living things do not, for leaves blow about in the wind and streams flow down a hillside. In the religions of early societies, therefore, we find a tendency to believe that life exists in all objects from rocks and pools to seas and mountains. This belief is technically known as *animatism*, which differs from *animism*, a somewhat more sophisticated view which holds that natural objects have no life in themselves but may be the abode of dead people, spirits, or gods who occasionally give them the appearance of life. The classic example of this, of course, is the assumption that an erupting volcano is an expression of anger on the part of the god who resides in it. Such beliefs may seem absurd today, but it is worth realising that we are not entirely free of them ourselves when we ascribe "personalities" of a limited kind to motor cars, boats, dolls, or models which incur our pleasure or anger depending upon how well they "behave."

Anthropomorphism, the attribution of human form, thoughts or motives to non-human entities or life forms from gods to animals. At one end this can be summed up in the once widespread image of God as a "white-bearded old gentleman sitting on a cloud." At the other end is the very common tendency to invest domestic animals and pets with man-like wishes and personalities. At both extremes the belief could be seriously misleading. Firstly, it could be very unwise to assume that God, if he exists, necessarily thinks as humans do and has human interests at heart. Secondly, we shall learn very little about animal behaviour if we look upon them as mere extensions of our own personality, and we do them less than justice if we see them simply as human beings of diminutive intelligence.

Anthroposophy, a school of religious and philosophical thought based on the work of the German educationist and mystic Rudolf Steiner (1861–1925). Steiner was originally an adherent of Madame Blavatsky's theosophical movement (*see* Theosophy) but in 1913 broke away to form his own splinter group, the Anthroposophical Society, following ideological disputes over the alleged "divinity" of the Indian boy Krishnamurti. Steiner was much influenced by the German poet and scientist, Goethe, and believed that an appreciation and love for art was one of the keys to spiritual development. One of the first tasks of his new movement was the construction of a vast temple of arts and sciences, known as the Goetheanum, to act as the headquarters of the society. This structure, which was of striking and revolutionary architectural style, was unfortunately burnt down in 1922 to be replaced by an even more imaginative one which today is one of the most interesting buildings of its kind in the world. Anthroposophy, which ceased to expand greatly following its founder's death, is nevertheless well-established in various parts of the world with specialised, and often very well equipped, schools and clinics which propagate the educational and therapeutic theories of the movement. These, which include the allegedly beneficial powers of music, coloured lights, etc., have made little impact on modern educational ideas, but the schools have acquired a reputation for success in the training of mentally handicapped children, though one suspects that these successes are due to the patience and tolerance exercised in these establishments rather than to the curative value of colour or music "therapy" itself. Despite its apparent eccentricities, anthroposophy has made its mark on art and architecture, the outstanding modern painter Kandinsky, for example, being particularly influenced by Steiner's ideas and teachings.

Anticlericalism, resentment of priestly powers and privileges, traceable in England to Wyclif's insistence in the 14th cent. on the right of all men to have access to the Scriptures. The translation of the Bible into the common tongue was a great landmark in the history of the Bible and the English language. Wyclif's principles were condemned by the Roman Church of his time but were readily accepted during the Reformation. Tudor anticlericalism arose from motives ranging from a greedy desire to plunder the riches of the Church to a genuine dislike of the powers of the priesthood whose spiritual courts still had the right to decide on points of doctrine or morals in an age when the layman felt he was well able to decide for himself. In innumerable ways the Church was permitted to extort money from the laity. It is generally agreed, says Trevelyan, that the final submission of church to state in England was motivated quite as much by anticlericalism as by Protestantism. The rise of the Reformed churches in England satisfied the people generally and anticlericalism never became the fixed principle of permanent parties as happened in France and Italy from the time of Voltaire onwards.

Antisemitism, a term first applied about the middle of the last century to those who were anti-Jewish in their outlook. Although this attitude was prevalent for religious reasons throughout the Middle Ages, modern anti-semitism differed (*a*) in being largely motivated by economic or political conditions, and (*b*) in being doctrinaire with a pseudo-scientific rationale presented by such men as Gobineau (1816–82) and Houston Stewart Chamberlain (1855–1927), and later by the Nazi and Fascist "philosophers." Beginning in Russia and Hungary with the pogroms of 1882 it gradually spread south and westwards where, in France, the Dreyfus case provided an unsavoury example in 1894. Thousands of Jews from Eastern Europe fled to Britain and America during this period; for in these countries anti-semitism has rarely been more than a personal eccentricity. During the last war the murder of six million Jews by the Nazis and their accomplices led to a further exodus to various parts of the world and finally to the creation of the state of Israel.

The individual Jew-hater makes unconscious use of the psychological processes of projection and displacement: his greed or sexual guilt is projected on to the Jew (or Negro or Catholic) because he cannot bear to accept them as his own emotions, and his sense of failure in life is blamed on his chosen scapegoat rather than on his own inadequacy.

But there are social causes too and politicians in some lands are well versed in the technique of blaming unsatisfactory conditions (which they themselves may have in part produced) upon minority groups and persuading others to do the same. Historically, the Jew is ideally suited for this role of scapegoat: (1) in the Middle Ages when usury was forbidden to Christians but not to Jews, the latter often became moneylenders incurring the opprobrium generally associated with this trade (*e.g.*, to the simple-minded Russian peasant the Jew often represented, not only the "Christ-killer," but also the moneylender or small shopkeeper to whom he owed money); (2) many trades being closed to Jews, it was natural that they concentrated in others, thus arousing suspicions of "influence" (*i.e.* Jews are felt to occupy a place in certain trades and professions which far exceeds their numerical proportion to the popula-

tion as a whole); (3) even with the ending of ghetto life, Jews often occupy *en masse* some parts of cities rather than others and this may lead to resentment on the part of the original inhabitants who begin to feel themselves dispossessed; (4) Jews tend to form a closed society and incur the suspicions attached to all closed societies within which social contacts are largely limited to members; marriage outside the group is forbidden or strongly disapproved of, and the preservation, among the orthodox, of cultural and religious barriers tends to isolate them from their fellow citizens. Discrimination, hateful as it is, does not come from one side only and it is such barriers as these that help to maintain an old and cruel folly. *See* Racism, Zionism, Judaism.

Antivivisection, opposition to scientific experimentation upon live animals based, according to its supporters, both on the moral grounds of the suffering imposed, and on the less secure claim that many doctors and scientists of repute have rejected the value of information gained in this way. It is true that the protagonists of the movement during its early days in the mid-19th cent. included a number of eminent physicians and surgeons, but few today—whatever their moral scruples—would deny the value of the results obtained. Without animal experiments we should be without vaccines, sera, or antitoxins against smallpox, tetanus, typhoid, diphtheria, poliomyelitis, and a multitude of other diseases; we should have no detailed knowledge about vitamins, or about the effects of radioactive fallout; we would be unable to test out new drugs for safety before using them on human beings. There are in Britain two or three large national anti-vivisection societies and several smaller ones. Much of their work is co-ordinated through the British Council of Anti-Vivisection Societies. Animal experimentation is controlled by Act of Parliament which makes obligatory the possession of licences by experimenters, inspection of laboratories by the Home Office, and the issue of annual returns of experiments. Many people would like the number of experiments on animals reduced and the law changed to prohibit any experiment in which there is any risk of inflicting suffering.

The colossal dilemma raised by the ethical problems of experimenting on living animals can be expressed in two opposing polemical questions: (1) to save a dearly loved member of one's family, how many guinea pigs would one be prepared to sacrifice?, and (2) supposing that a vastly superior alien life form visited earth, would they be justified in experimenting (purely in the interests of science) on living human beings?

Apartheid, an Afrikaans word meaning "apartness," referred to by South African Government spokesmen as "separate development" or "self-development." To others it means the system of total racial discrimination between black and white South Africans—the permanent inhabitants of the country—as enforced by the Nationalist Party since it came to power in 1948. Some degree of racial segregation has existed in South Africa since the earliest days of colonialism in the mid-17th cent. and the policy was continued by the United Party under Smuts and Hertzog from 1934 onwards though it was never a political issue. This changed when the Nationalist Party gained power and oppressive measures against the non-White segment of the population have grown steadily under Malan, Strydom, Verwoerd, and Vorster. *Apartheid* involves the beliefs in racial purity and *baaskap*, or white supremacy. It means keeping vast African populations in a condition of helotry. Thousands of families are broken up by the pass laws. The official policy of the South African Government is to create separate self-governing black states in which the Africans would be guided to self-government and, it is claimed, eventually to independence. The first so-called bantu reserve was set up in the Transkei in 1962. But Africans with 70 per cent of the population would have only about 13 per cent of the land, and the poorest land at that; cities and mineral areas would remain the reserve of the whites. Total *apartheid* or complete separation of the black and white races in South Africa remains unlikely to be realised since mining, the main industry of the country is based on low-paid African labour.

The sports boycott, the conflict between the churches and the government, and the economic need to make more use of African labour, could bring an impetus for change. Recent signs that black African states—notably Nigeria—may soon acquire international economic power through the selective use of their oil resources also suggest that vigorous pressure may be brought upon apartheid-minded governments to change their ways.

See also Africa, Section C, Part I.

Aquarius, one of the twelve "signs of the Zodiac." This has recently achieved special significance in the mythology of our time because of the pronouncements of astrologers that the world is shifting out of the 2000-years-old cycle of the Age of Pisces, the fish, into that of Aquarius the water-carrier. The exact date of the transition is a matter of astrological controversy, but the consensus is that it began in 1960 and will be completed sometime in the 24th century. The Aquarian Age is predicted to be one of peace and harmony, replacing the era of strife which, ironically, has marked the dominance of the Christian symbol of the fish. Such speculations are totally without scientific backing and are mentioned here only to draw attention to the grip which astrological and other mythical concepts still have on human thinking. One of the first spaceships to carry man to the moon, for example, was named Aquarius by its crew.

See also Astrology.

Arianism, formed the subject of the first great controversy within the Christian Church over the doctrine of Arius of Alexandria (d. 336) who denied the divinity of Christ. The doctrine, although at first influential, was condemned at the Council of Nicaea (325), called by the Emperor Constantine, at which Arius was opposed by Athanasius, also of Alexandria, who maintained the now orthodox view that the Son is of one substance with the Father. Arius was banished and the heresy had died out by the end of the 4th cent., but disbelief in the divinity of Christ has formed part of the doctrine of many minor sects since, notably in Unitarianism (*q.v.*).

Assassins, a sect of Moslem Shi'ites, founded by the Persian Hasan i Sabbah (*c.* 1090), which for more than two centuries established a rule of terror all over Persia and Syria. The coming of the Mongols in 1256 destroyed them in Persia and the Syrian branch suffered a similar fate at the hands of the then Mamluk sultan of Egypt, *c.* 1270. It was a secret order, ruled over by a grand master, under whom the members were strictly organised into classes, according to the degree of initiation into the secrets of the order. The devotees, belonging to one of the lower groups, carried out the actual assassinations under strict laws of obedience, and total ignorance of the objects and ritual of the society. It is believed that the latter were given ecstatic visions under the influence of hashish, whence the term *hashshashin*, which became corrupted to "assassin."

Associationism. In psychology, the Associationist school of the 19th cent. accepted the association of ideas as the fundamental principle in mental life. It was represented in Britain by the two Mills and Herbert Spencer, in Germany by J. F. Herbart (1776–1841). To these, mental activity was nothing but the association of "ideas" conceived of as units of both thought and feeling—the emotion of anger or the perception of a chair were both "ideas"—and apart from them the self did not exist. Personality was simply a series of these units coming and going, adding to or cancelling each other out, in accordance with rigid and mechanistic scientific laws.

Astrology was once the best available theory for explaining the course of human life and bears much the same historical relationship to astronomy as alchemy does to chemistry. Originally it was divided into the two branches of Natural Astrology which dealt with the movements of the heavenly bodies and their calculations, and Judicial Astrology which studied the

alleged influence of the stars and the planets on human life and fate. It was the former that developed into modern astronomy; the latter was, and remains, a primitive myth.

Astrology owes most to the early Babylonians (or Chaldeans) who, being largely nomadic in an environment which permitted an unobstructed view of the sky, readily accepted the idea that divine energy is manifested in the movements of the sun and planets. Gradually this concept became enlarged and the relative positions of the planets both in relation to each other and to the fixed stars became important together with the idea of omens—that, if a particular event occurred whilst the planets were in a particular position, the recurrence of that position heralded a recurrence of the same sort of event. Soon the planets became associated with almost every aspect of human life. They were bound up with the emotions, with parts of the body, so that astrology played quite a large part in medicine up to late mediaeval times. Not only was the position of the planet to be considered but also the particular sign of the zodiac (or house of heaven) it was occupying, and it was believed possible to foretell the destiny of an individual by calculating which star was in the ascendant (*i.e.* the sign of the zodiac nearest the eastern horizon and the star which arose at that precise moment) at the time of his birth. Astrology was popular among the Egyptians, the Romans (whose authorities found the Chaldean astrologers a nuisance and expelled them from time to time), and during the Middle Ages when astrologers were often highly respected.

Despite the apparent absurdity of astrological beliefs—for example, how could the pattern of light from stars billions of miles away possibly influence the temperament of single individuals on earth—a substantial number of intelligent and well-educated people take its study in all seriousness. The most interesting "convert" was the psychologist and philosopher, Carl Jung, who conducted a complex experiment in which he compared the "birth signs" of happily married and divorced couples and claimed to find that those most favourably matched in astrological terms were also those more likely to have permanent wedded bliss. Jung's otherwise world-shaking finding has been shown to be based on a simple statistical fallacy and is likely to be of little practical value to young people uncertain about their choice of marriage partner. However, Jung took his findings as evidence for his own theory of "synchronicity" (*q.v.*), an involved and near-metaphysical notion which holds that events in the universe may be significantly related in a "non-causal" fashion. For simpler souls astrology is still principally a source of entertainment, though human beings' natural inclination to peer into the future often draws them into astrology with at least semi-serious motives.

Atheism. *See* God and Man.

Atlantis, a mythical continent supposed to have lain somewhere between Europe and America and a centre of advanced civilisation before it was inundated by some great natural catastrophe in pre-Christian times. There is little, if any, serious historical or archaeological evidence for its existence, but the legend of the Golden Land destroyed when the waters of the Atlantic closed over it has remarkable staying power and is believed by large numbers of people. Plato wrote convincingly about the wonders of Atlantis in his dialogues *Timaeus* and *Critias*, while other writers gave suggested that the biblical story of the Flood is based on fragmentary accounts of the Atlantean deluge. The lost continent is also of occult significance, largely as the result of the writings of W. Scott-Elliott whose book, *The Story of Atlantis* (recently re-published by the Theosophical Society), alleged that by clairvoyance he had been able to contact the spirits of Atlanteans who had been destroyed because of their addiction to black magic. There even exists in Britain today a minor but ardent religious group, "The Atlanteans," who hold that Atlantis still exists today, but on a different metaphysical plane, and that it is possible to communicate with it via individuals with supposedly mediumistic powers (*see* Spiritualism). Members of the Atlanteans meet regularly to hear talks about the vanished continent and "trance addresses" by one of the high priests of Atlantis, Helio-Arconaphus. Such beliefs, though unusual, are essentially harmless and merely reflect the great variety of religious attitudes which human beings enjoy and to which they are entitled.

Atomism. (1) in philosophy, the atomists were a group of early Greek thinkers, the most important of whom were Leucippus (fl. *c.* 440 B.C.) and his younger contemporary Democritus (*c.* 460–370 B.C.). Prior to these men, although it had been agreed that matter must be composed of tiny ultimate particles and that change must be due to the manner in which these mingled or separated from each other, it was supposed that there existed different types of particle for each material—*e.g.* for flesh, wood, hair, bone. The atomists taught that atoms were all made of a single substance and differed only in the connections (pictured as hooks, grooves, points, etc.) which enabled them to join each other in characteristic ways. Theirs was the first move towards modern atomic theory and a predecessor of the modern concept of chemical linkages. (2) in psychology, atomism refers to any theory which holds that mental states can be analysed without loss into elementary units, *e.g.* Associationism and Behaviourism (*qq.v.*).

Authoritarianism, a dictatorial form of government as contrasted with a democratic one based on popular sovereignty. Its alleged advantages are the avoidance of the delays and inefficiency said to be characteristic of the latter, but like "Bolshevism" the word is used today mainly as a form of abuse.

Automatism, the production of material, written or spoken in "automatic" fashion—*i.e.*, apparently not under the conscious or volitional control of the individual. This psychologically perplexing phenomenon has occurred from time to time throughout the history of literature and art, and while it has occasionally produced work of great merit (much of William Blake's poetry, Coleridge's "Kubla Khan," etc.) the bulk of it is indifferent and often simply rubbish. Spiritualists claim that the work is produced under the direct guidance of the spirit world, and their argument has recently attracted considerable attention through the compositions of the pianist Rosemary Brown who, with little or no academic background in musical theory, has produced a number of "original" piano pieces allegedly composed by Beethoven, Mozart, etc., from the astral plane. While few music critics doubt Mrs. Brown's honesty and integrity, most consider her work to be clever pastiche and barely comparable in quality to the masterworks of the dead composers. Nevertheless automatism wants some explaining, and most psychologists today defer judgement, taking the view that it serves to remind us of the fund of material which lies in the unconscious mind, and which is prone to pop up from time to time without warning. One psychologist even trained himself to produce automatic writing, and found himself engaged in conversation with a peculiar "secondary personality" which generated reams of rhyming verse. He was sophisticated enough not to be disappointed at its abysmal quality.

B

Baconian Method, the use of the inductive (as opposed to the deductive or Aristotelian) method of reasoning as proposed by Francis Bacon in the 17th cent. and J. S. Mill in the 19th cent. Deduction argues from supposedly certain first principles (such as the existence of God or Descartes's "I think, therefore I am") what the nature of the universe and its laws *must* be, whereas the only means of obtaining true knowledge of the universe, in Bacon's view, was by the amassing of facts and observations so that when enough were obtained the certain truth would be known in the same way that a child's numbered dots in a playbook joined to-

gether by a pencilled line create a picture. However, this is not the way science progresses in practice (*see* F3(1)). Bacon underrated the importance of hypothesis and theory and overrated the reliability of the senses. In discussing the scientific tradition, Sir Karl Popper in his book, *Conjectures and Refutations*, says: "The most important function of observation and reasoning, and even of intuition and imagination, is to help us in the critical examination of those bold conjectures which are the means by which we probe into the unknown." Two of the greatest men who clearly saw that there was no such thing as an inductive procedure were Galileo and Einstein.

Bahá'í Faith, a faith which teaches the unity of all religions and the unity of mankind. It arose in Iran from the teachings of the Bab (Mirza Ali Mohammed, 1820–50) and the Bahá'u'lláh (Mirza Husain Ali, 1817–92), thought to be manifestations of God, who in his essence is unknowable. Emphasis is laid on service to others. It has communities in many states and is surprisingly strong in England with a substantial following among university students. Its aims—universal peace, love, fellowship, etc. —are so laudable that it is hard to disagree with anything in the movement. On the other hand it is equally hard to see what it can offer, apart from more good intentions, over and above the fare provided by more orthodox religious systems. Since 1921, when Bahá'u'lláh's son, 'Abdu'l Bahá, died, there have been three leaders or Guardians of the Faith, each appointed by his predecessor. The holy places of the Faith are situated on or near Mount Carmel.

Baptists, a Christian denomination whose distinctive doctrines are that members can only be received by baptism "upon the confession of their faith and sins" and that "baptism in no wise appertaineth to infants." Baptism is therefore by total immersion of adults. Modern Baptists base their doctrines upon the teaching of the Apostles and some hold that the **Albigenses** (*q.v.*) maintained the true belief through what they regarded as the corruption of the Roman Church in mediaeval times. On the other hand any connection with the Anabaptist movement during the Reformation is rejected and the beginning of the modern Church is traced to John Smyth, a minister of the Church of England who in Amsterdam came under the influence of the **Arminians** (*q.v.*) and Mennonites. Smyth died in 1612 when the first Baptist church in England was built at Newgate. This, the "General" Baptist Church, rejected Calvinistic beliefs and held the Arminian doctrine of redemption open to all, but some years later a split occurred with the formation of the "Particular" Baptist Church which was Calvinist in doctrine. In 1891 the two bodies were united in the Baptist Union and today the sect is spread throughout the world notably in the U.S.A.

The Anabaptist movements of Germany Switzerland, and Holland also practised adult baptism in addition to a primitive communism and demanded social reforms. Persecuted by both Catholics and Protestants, their leader, Thomas Münzer, and many others were burned at the stake (1525). However, this sect was noted for its violence under a religious guise, and its taking over of the state of Münster in 1533 was characterised by wild licentiousness, since, as Antinomians, they believed that the "elect" could do no wrong. A revival begun by Menno Simons (d. 1561), a Dutch religious reformer, led to the formation of the Mennonite sect which, whilst rejecting infant baptism, gave up the objectionable features of the Anabaptists. This reformed sect still exists as small agricultural groups in the original strongholds of the movement and in the United States.

Beat Generation, a term first used by the American writer Jack Kerouac (d. 1969), author of *The Town and the City* and *On The Road*, to define various groups spread across the face of the country, but notably New York and San Francisco, who, belonging to the post-war generation, represented a complex of attitudes. Briefly, these are: rejection of the values of the past and lack of conviction in the possibility of a future for humanity—hence an acceptance of nothing but the immediate present in terms of experience and sensations; rebellion against organised authority, not out of any political conviction (as in the case of anarchism), but rather from lack of any interest or desire to control events, nature, or people; contempt for the "Square"—the orthodox individual who, stuck firmly in his rut, "plays it safe" and remains confident of the rightness and decency of his moral values. *See* **Beat Poets, Section M.**

The Beat generation of the 1940s and 50s gave way to the Love generation or Flower people, with their flowers, beads, and cowbells. Their social philosophy was the same—living in the present, unconventionally, seeking personal freedom, believing drugs to be essential, claiming to be acting against the rat race, dissociating themselves from politics, taking a superficial interest in the religions of the East, borrowing much of their language, music, and ideas on dress from the American "hippy"; yet believing in the creation of a new and gentler society based on different forms and values.

Both the Beat and the Love generations have appealed largely to the younger segment of society who, disillusioned with orthodox religion and traditional politics, have sought outlets for their powerful, if poorly expressed, drives and emotions. Early group manifestations of the Beat and Drop-out variety had limited internal structure and no co-ordinated political motive and have thus constituted no threat to the established political forces and governments of the world. Quite recently, however, clear signs of coherent organisation in these numerically substantial groups have begun to emerge, giving rise to a powerful anti-establishment movement known as the "underground" (*q.v.*).

Behaviourism, a school of psychology founded in 1914 by J. B. Watson (1878–1958), an animal psychologist at Johns Hopkins University, Baltimore. Its main tenet was that the method of introspection and the study of mental states were unscientific and should be replaced by the study of behaviour. When animals or human beings were exposed to specific stimuli and their responses objectively recorded, or when the development of a child, as seen in its changing behaviour, was noted, these alone were methods which were truly scientific. Watson contributed an important idea to psychology and did a great deal towards ridding it of the largely philosophical speculations of the past. But he also went to absurd extremes, as in his view that thought is nothing but subvocal speech, consisting of almost imperceptible movements of the tongue, throat, and larynx (*i.e.*, when we think, we are really talking to ourselves), and his further opinion that heredity is, except in grossly abnormal cases, of no importance. He claimed that by "conditioning," the ordinary individual could be made into any desired type, regardless of his or her inheritance.

The work of Ivan Pavlov had begun about 1901, but was unknown in America until about ten years later, and it was through another Russian, Vladimir Bekhterev, that the concept of "conditioning" was introduced into the country. Bekhterev's book *Objective Psychology*, describing his new science of "reflexology," was translated in 1913 and played a great part in the development of Behaviourist ideas. The conditioned reflex became central to Watson's theory of learning and habit formation (*e.g.*, he showed that a year-old child, at first unafraid of white rats, became afraid of them when they came to be associated with a loud noise behind the head). Finally all behaviour, including abnormal behaviour, came to be explained in terms of conditioned responses; these were built up by association on the infant's three innate emotions of fear, rage, and love, of which the original stimuli were, for the first, loud noises and the fear of falling; for the second, interference with freedom of movement; and for the third, patting and stroking.

Because of its considerable theoretical simplicity and its implicit suggestion that human behaviour could be easily described (and even modified or controlled), Pavlovian psychology appeared very attractive to the Communist regime in Russia, and before long it became the

"official" dogma in universities and research laboratories. Whereas in America and Western Europe its severe limitations became gradually apparent, in Russia these were ignored or disguised for ideological reasons with the inevitable outcome that Soviet psychology failed to evolve and, at one stage, seemed to be no more than a pallid offshoot of physiology. The recent liberalisation which has been taking place throughout Soviet society has led to a considerable broadening of scientific horizons and Pavlovian ideas are no longer looked upon with such unquestioning reverence. In non-Communist countries simple Watsonian behaviourism has evolved into more sophisticated studies of animal learning, largely pioneered by the Harvard psychologist, Skinner. These techniques, which have shown that animals, from monkeys to rats, may be taught to solve a remarkable range of physical problems (such as pressing complex sequences of buttons or levers to escape from a cage) have themselves turned out to be rather disappointing in terms of advancing our general understanding of the workings of the human and animal brain. There is a growing feeling among psychologists that the real keys to the understanding of mankind will only be found through the study of man himself, and not of his simpler animal cousins. *See also* Gestalt psychology and Q18–20.

Benthamism. *See* Utilitarianism.

Bhagavad-Gita, a lengthy philosophical poem of great beauty which, while not part of the sacred Veda (*see* Hinduism) is nevertheless counted as being the most famous and widely read of the Hindu scriptures. In it the God Krishna explains the nature of the universe to his friend Arjuna, and points out that the way to salvation is through a total and immersing love of God. It also contains the basic details of the practice of yoga (*q.v.*).

Black Power. The division of the world's population into races is now generally agreed by scientists to have arisen as the result of climatic and environmental pressures—the darker, more highly pigmented peoples tending to be better equipped to withstand higher solar output than the fairer, more northerly based types. For various reasons, again largely climatic and environmental, the first great advances in civilisation came from the temporary ascendancy over the black or near-black. Until quite recently—not much more than a century ago—the technological gulf between white and black was so vast that the negroid races were often held in slavery by the Europeans and while such a thought might be repugnant to most today, attitudes to coloured people still reflect a notion of inherent white "superiority" which it is easy to deny intellectually but difficult to shake-off emotionally. In the U.S.A., the most advanced and at the same time the most tormented multi-racial society in the world, the role of the substantial negroid population has changed dramatically in the last hundred years, shifting from that of slave to friendly servant, and then to near, or theoretical, equal. With this shift has come a corresponding change in the black community's view of itself, from relief at being no longer slaves, to gratitude at being allowed to do the menial jobs in the American society. More recently, with advances in educational opportunity and increasing political liberalisation, the attitude of the Negro in the U.S.A. has shifted yet again—from subservience to intellectual and physical equality, and even, perhaps, to inherent superiority. This new stand, rare at first, but spreading rapidly across America and other parts of the world throughout the 1960s, has crystallised in the concept and ideology of "Black Power," a movement of growing significance and importance in modern society. It is hard to trace the moment at which this formally emerged but one of its first expressions was the use by Negroes of the phrase "Black is beautiful," an apparent wakening of the belief that their colour, physique, features, hair, etc., were in no way aesthetically inferior to those of Europeans. Suddenly, in Negro communities it became no longer fashionable to artificially straighten hair, to bleach the skin, or even to copy white American clothing, social habits, speech, and mannerisms. Alongside this highly important psychological jump—a rejection of the white man's social patterns—came an increasing rejection of his political machinery as well, a belief that the black races should have political autonomy and power of their own and not as part of an integrationist evolution of Caucasian societies.

The Black Power movement at this moment has no formal political representation in the United States, largely because it spurns the normal democratic approach of offering up candidates for election, but its strength and growing potency is well understood by enlightened American politicians who take careful account of its views on current or proposed "racialist" legislation. Its present strategy is a declared one of attaining black supremacy and autonomy rapidly, by violence and revolution if necessary, and it has supporters in all sections of the Negro population—and among many of the younger whites as well. Whether open conflict between blacks and whites in America will ever break out on a large scale is at this time uncertain, but increasing liberalisation and better opportunities for educational and social advancement for Negroes must ultimately serve to ease tension, while an oppressive "white backlash" would inevitably provoke bloody conflict. The overt aggression and ruthlessness of the Black Power movement and its adherents is probably an understandable swing of the pendulum following centuries of abuse and suppression, but its latent strength and grim sense of purpose should not be underestimated.

Bolshevism, an alternative name for Communism (*q.v.*), usually used in the West in a derogatory sense. When the Russian Social Democratic Party at a conference held in London in 1903 split over the issue of radicalism or moderation, it was the radical faction headed by Lenin (who subsequently led the 1917 Revolution and became first Head of State of the Soviet Union) which polled the majority of votes. The Russian for majority is *bolshinstvo* and for minority *menshinstvo*; hence the radicals became known as Bolsheviki and the moderates as Mensheviki, anglicised as Bolsheviks and Mensheviks. *See* Communism, Marxism.

British Israelites, a religious group who hold the race-theory that the English-speaking peoples (of the White Race) are the lineal descendants of the "lost Ten Tribes" of Israel (deported by Sargon of Assyria on the fall of Samaria in 721 B.C.). They believe the Anglo-Saxons to be God's "Chosen People" in the literal sense of the term as it is used in the Old Testament, by whom the world will be brought in readiness for the Millennium. The official organisation is the British–Israel World Federation of which the official journal is the *National Message*. Some British Israelites have the notion that the future can be foretold by the measurements of the Great Pyramid.

Buchmanism. *See* Moral Re-Armament.

Buddhism, one of the great Oriental religions. It arose against the background of Hinduism in north India in the 6th cent. B.C., its founder (real or legendary) being the Hindu prince Siddhartha Gautama, known as the Buddha or "Enlightened One." Distressed by the problem of human suffering from which even death allowed no escape—since Buddha accepted the Hindu doctrine of a cycle of lives—he left his palace and his beloved wife and child to become a religious mendicant and ascetic, studying without success for six years the beliefs of Brahmin hermits and self-torturing recluses. After this fruitless search he sat down under a tree (the Bo-tree) and finally came to understand the cause and cure of suffering. The result of his meditations are enshrined in the "four noble truths" which are: (1) that existence is unhappiness; (2) that unhappiness is caused by selfish desire or craving; (3) that desire can be destroyed; (4) that it can be destroyed by following the "noble eightfold path" whose steps are: right views; right desires; right speech, plain and truthful; right conduct, including abstinence not only from immorality but also from taking life, whether human or animal; right livelihood, harming no one; right

effort, always pressing on; right awareness of the past, the present, and the future; and lastly, right contemplation or meditation. The more man acquires merit by following these rules in his chain of lives, the sooner is *Nirvana* attained; he loses his individuality, not by annihilation, but "as the dewdrop slips into the shining sea," by merging with the universal life.

Buddhism teaches the way of liberation through ethics and discipline. A universal God plays no part in this religion, and in many Buddhist nations no word exists for the concept which was neither affirmed nor denied by Buddha himself but simply ignored. Nor did Buddha claim to be other than a man, although much superstition entered the religion at a later date; prayers were made to Buddha, ritual developed, sacred relics preserved under stupas, and the belief in a succession of Buddhas introduced; the sacred writings (*Tripitaka*) are divided into three parts: for the layman, the monks, the philosophers. They were produced by devotees at three councils—the first held immediately after the death of Buddha at the age of 80, the last at the order of King Asoka in 244 B.C. The founder himself wrote nothing.

Buddhism spread to Ceylon, Nepal, Tibet, Mongolia, Indo-China, Burma, Siam, China, and Japan, although on the whole losing influence in India. In Tibet, Buddhism developed into Lamaism (*q.v.*). In Ceylon and Burma it persisted in its pure form (the Hinayana), while in China and Japan it developed into the Mahayana with its bodhisattvas and avatars. Sects developed, one of the most important being the Chinese Ch'an (Japanese Zen) Buddhism (*q.v.*). Outside Asia there are active movements in many Western countries where the serenity and rational humanism of Buddhism appeals to intellectuals as diverse as staid humanists and eccentric beatniks.

Bushido, the traditional code of honour of the Samurai or Japanese military caste corresponding to the European concept of knighthood and chivalry with which it took its separate origin in the 12th cent. Even today it is a potent influence among the upper classes, being based on the principles of simplicity, honesty, courage, and justice which together form a man's idea of personal honour. *Bushido* was strongly influenced by Zen Buddhism (*q.v.*).

C

Cabala, originally a collection of Jewish doctrines about the nature of the Universe, supposedly handed down by Moses to the Rabbis, which evolved into a kind of mystical interpretation of the Old Testament. Students of the history of religious belief have found its origins to be in fact extremely obscure, and some aspects appear to have been lifted from ancient Egyptian sources. Skilled Cabalists hold that the system contains a key to biblical interpretation based on the numerical values of the words and letters of the scriptures which reveal hidden depths of meaning behind the allegorical Old Testament stories.

Calvinism, the branch of Protestantism founded basically (although preceded by Zwingli and others) by Jean Chauvin (1509–64), who was born in Noyon in Picardy. John Calvin, as he is usually called, from the Latin form of his name, Calvinius, provided in his *Institutions of the Christian Religion* the first logical definition and justification of Protestantism, thus becoming the intellectual leader of the Reformation as the older Martin Luther was its emotional instigator. The distinctive doctrine of Calvinism is its dogma of predestination which states that God has unalterably destined some souls to salvation to whom "efficacious grace and the gift of perseverance" is granted and others to eternal damnation. Calvinism, as defined in the Westminster Confession, is established in the Reformed or Presbyterian churches of France, Holland, Scotland, etc., as contrasted with the Lutheran churches, and its harsh but logical beliefs inspired the French Huguenots, the Dutch in their fight against Spanish Catholic domination, and the English Puritans. The rule set up under Calvin's influence in Geneva was marred by the burning at the stake of the anatomist Servetus for the heresy of "pantheism," or, as we should say, Unitarianism.

Perhaps its greatest single influence outside the Church was the result of Calvinist belief that to labour industriously was one of God's commands. This changed the mediaeval notions of the blessedness of poverty and the wickedness of usury, proclaimed that men should shun luxury and be thrifty, yet implied that financial success was a mark of God's favour. In this way it was related to the rise of capitalism either as cause or effect. Max Weber, the German sociologist, believed that Calvinism was a powerful incentive to, or even cause of, the rise of capitalism (*q.v.*); Marx, Sombart, and in England, Tawney, have asserted the reverse view—that Calvinism was a result of developing capitalism, being its ideological justification.

Capitalism is an economic system under which the means of production and distribution are owned by a relatively small section of society which runs them at its own discretion for private profit. There exists, on the other hand, a propertyless class of those who exist by the sale of their labour power. Capitalism arose towards the end of the 18th cent. in England where the early factory owners working with small-scale units naturally approved of free enterprise and free trade. But free enterprise has no necessary connection with capitalism; by the beginning of this century monopolies were developing and state protection against foreign competition was demanded. Capitalism is opposed by those who believe in socialism (*q.v.*), first, for the moral reasons that it leads to economic inequality and the exploitation of labour and the consuming public, and that public welfare rather than private profit should motivate the economic system; secondly, for the practical reason that capitalism leads to recurrent economic crises. Defenders of the system, however, maintain that it conduces to efficient production by providing the strongest incentive to enterprise and good service.

Cartomancy, the art of telling fortunes or predicting the future by playing cards or by the Tarot pack. The elegant Tarot cards number 78 in all and are probably mediaeval in origin. They are rich in symbolism and include trump cards depicting the devil, the pope, death, the moon, the wheel of fortune, etc., and are an interesting part of our cultural mythology. There is no evidence whatsoever that they can be used in any objective way to divine the future, and professional fortune tellers and clairvoyants who use them almost certainly rely on a little native, basic psychology to achieve their results.

Catholicism. For those who are not Roman Catholics the term "Catholic" has two separate meanings. The more general refers to the whole body of Christians throughout the world, the more specific refers to a particular view of Christianity. In this latter sense the Church of England, the Orthodox Eastern Churches, and others consider themselves "Catholic" meaning that (*a*) they belong to Christ's Church as organised on an accepted basis of faith and order; (*b*) they insist on the necessity of "liturgical" worship through established forms (*e.g.*, baptism, holy communion); (*c*) they emphasise the continuity of Christian tradition by the use of ancient creeds (*e.g.*, the Apostles' Creed, the Nicene Creed) and regard the ministry as a succession (Apostolic succession) deriving from early practice. In this sense there is thought to be no necessary contradiction between Catholicism and Protestantism regarded as a renewal of the Church in the 16th cent. by an appeal to the Scriptures as interpreted by the early Fathers of the Church. This definition obviously excludes Quakers, Christian Scientists, and many Nonconformist sects.

The Roman Catholic Church is the religious organisation of all those who acknowledge the bishop of Rome as head of the Christian

Church, recognizing him as the lawful successor of St. Peter, who was the apostle appointed by Christ to be the head of the Church. Whereas in the Protestant Churches prayer and preaching play a central part (each individual soul seeking direct communication with God), in Roman Catholic worship the central service is the Mass, or Holy Eucharist, the seven sacraments (baptism, confirmation, eucharist, penance, extreme unction, orders, and marriage) being administered by a special priesthood. Church discipline and organisation are strong and authoritarian. *See* **Papal Infallibility.**

Characterology, the attempt made over many centuries to classify people into personality types on the basis of physical or psychological characteristics. The first attempt was made by Hippocrates in the 5th cent. B.C. who classified temperaments into the *sanguine* (or optimistic), the *melancholic*, the *choleric* (or aggressive), and the *phlegmatic* (or placid); these were supposed to result from the predominance of the following "humours" in the body: red blood, black bile, yellow bile, or phlegm respectively. Theophrastus, a pupil of Aristotle, described, with examples, thirty extreme types of personality (*e.g.* the talkative, the boorish, the miserly, etc.); these were basically literary and imaginative but about the same time "physiognomy" arose which attempted to interpret character from the face. Physiognomy became of importance again during the Renaissance and there are still those today who believe in it in spite of the fact that, broadly speaking, there is no connection whatever between facial features and personality (*i.e.* although it may be possible to tell from the features that a man is an idiot or some extreme abnormal type and some idea of character may be obtained from an individual's characteristic facial expressions, it is not possible to tell (as Johann Lavater, the best-known physiognomist of the late 18th cent. believed) from the shape of the nose, height of the brow, or dominance of the lower jaw, whether anyone is weak, intellectual, or determined). The contention of the 19th cent. Italian criminologist Cesare Lombroso that criminals show typical facial characteristics—prominent cheekbones and jaw, slanting eyes, receding brow, large ears of a particular shape—was disproved by Karl Pearson early this century when he found that 3,000 criminals showed no significant differences of features, carefully measured, from a similar number of students at Oxford and Cambridge.

It has, however, been noted that people in general tend to be intellectual or emotional, inward- or outward-looking, and this observation is reflected in the classifications of the Scottish psychologist, Alexander Bain (d. 1903), into intellectual, artistic, and practical; Nietzsche's Apollonian and Dionysian types; William James's "tender" and "tough-minded"; and C. G. Jung's introvert and extrovert. Careful experiments have shown that these are not clear-cut and that most individuals fall in between the extremes.

Some connection has been found between temperament and body-build. The German psychiatrist Ernst Kretschmer (b. 1888) showed that manic-depressive patients and normal people who are extroverted and tend to alternate in mood (as do manic-depressives to an exaggerated degree) were usually short and stout or thick-set in build; schizophrenics and normal people, who both show shyness, serious or introverted reactions, were usually tall and slender. The former of "pyknic" body-build are "cyclothyme" in temperament, the latter with "schizothyme" temperament are of two bodily types—the tall and thin or "asthenic" and the muscularly well-proportioned or "athletic." The American Sheldon has confirmed these observations on the whole and gone into further details. According to him the basic body types are: (1) *endomorphic* (rounded build), corresponding to Kretschmer's pyknic, normally associated with the *viscerotonic* temperament (relaxed, sociable); (2) *mesomorphic* (squarish, athletic build), normally associated with the *somatotonic* temperament (energetic, assertive); and (3) *ectomorphic* (linear build) normally associated with the *cerebrotonic* temperament (anxious, submissive, restless). Glandular and metabolic factors have considerable effect on human personality and also, to some extent, on physique. It is not too surprising, therefore, to find an association between body build (or "somatotype" as Sheldon termed it) and general mood. However, Sheldon's original clear-cut and oversimplified categories of body-type are no longer looked upon as reliable indicators of personality.

Chartism, a socialistic movement in England (1837–55) which attempted to better the conditions of the working classes. Named after "The People's Charter" of Francis Place (1838), its programme demanded: (1) universal manhood suffrage; (2) vote by ballot; (3) equal electoral districts; (4) annual parliaments; (5) payment of members; (6) abolition of their property qualifications. Chartism was supported by the Christian socialists (*q.v.*), J. F. D. Maurice (1805–72), and Charles Kingsley (1819–75) with certain qualifications. The movement, the first mass organisation of the industrial working class, had considerable influence on the evolution of socialist ideas in England. It is worth noting that its demands—with the exception of the unworkable "annual parliament"—have largely been met today, though at the time they were thought by many to be both outrageous and impossible.

Chauvinism, a term applied to any excessive devotion to a cause, particularly a patriotic or military one. The word is derived from Nicholas Chauvin whose excessive devotion to Napoleon made him a laughing-stock.

Chirognomy, the attempt to read character from the lines in the hand (as contrasted with chiromancy or palmistry, in which an attempt is made to tell the future in the same way) is an ancient practice which, like astrology (*q.v.*) has no discernible scientific basis but a very considerable popular following. As with astrology, where it is hard to see what kind of link could exist between the constellations and human behaviour, so it is equally hard to see how the configuration of lines on the hand could be paralleled by psychological attributes. This argument might be thought of as irrelevant if palmistry, etc. actually had predictive power, but the plain fact is that when put to a scientific test, practitioners of these arts turn out to show no abilities beyond those with which a normally perceptive individual is equipped.

Chiropractice, the art of manipulation of the joints, in particular the spine, as a means of curing diseases, is a slightly fashionable quasi-medical practice. Few qualified doctors employ its questionable principles though, as with its near-neighbour osteopathy, it seems on occasions to be a useful complement to medical treatment. Much controversy surrounds the status of practitioners of fringe medicine of this kind. In America osteopathy (bone manipulation), which seems to be beneficial in many cases for the condition known as prolapsed or "slipped" disc, is becoming gradually merged into orthodox medical practice.

Christadelphians, a religious denomination formed in the U.S.A. about 1848 at the time of the American Civil War by John Thomas, an Englishman from London. They claim to represent the simple apostolic faith of the 1st cent., and, in common with many other sects, hold that they alone interpret the Scriptures truly. They believe that Christ will return soon to set up the Kingdom of God with Jerusalem as its capital. In social life Christadelphians keep to themselves and hold aloof from organisational activities, though they do take an interest in political events if only from the point of view of their belief in biblical prophecy.

Christianity, the religion founded by Jesus Christ whose teaching is found in the New Testament's four Gospels. Simple as His creed may seem it soon became complicated by the various ways in which Christians interpreted it, and the differences within the early Church are reflected in the numerous Councils held to define truth from heresy. The Eastern Church of the Byzantine Empire from the 5th cent. onwards had differed in various ways from the See of Rome and by 1054 the breach became permanent. The 16th cent. Reformation was the

other great break in the unity of the Church and once Protestantism had given in effect the right to each man to interpret the Scriptures in his own way, the tendency to fragmentation increased so that, by 1650, there were no fewer than 180 sects, mostly dogmatic and intolerant towards each other. Today there are many more, some of which are mentioned in this section under the appropriate headings. Nevertheless there are signs today that the trend of disunity is being reversed. The modern ecumenical movement, which has its roots in the great missionary movement of the 19th cent., aims to bring about a reunion of Christendom by uniting Christians throughout the world on the simple basis of the acceptance of Jesus Christ as God and Saviour, *i.e.*, on the basis of Christian fellowship. The movement finds expression in the World Council of Churches (*q.v.*). The Christian life is expressed in the words of Christ: "Thou shalt love the Lord thy God with all thy heart and thy neighbour as thyself." For many it is the humanitarian side of Christianity that has meaning today: to accept responsibility for others, as well as for oneself. *See* chart, below.

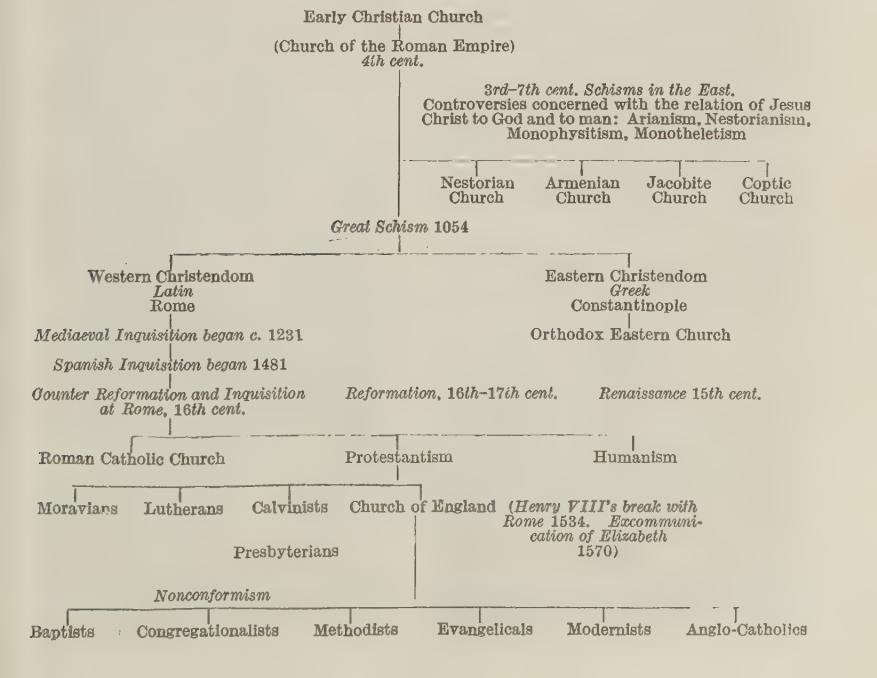
Christian Science, a religious denomination founded by Mary Baker Eddy (1821–1910), an American lady who sought to organise a church which would reinstate primitive Christianity and its lost element of healing. The sacred books of the movement are the Bible and *Science and Health with Key to the Scriptures* (1891), a revision of *Science and Health*, first published by Mrs. Eddy in 1875. Its main tenets (quoting from an official Christian Science source) are "that nothing is real save God and His spiritual creation, including man in His image and likeness; that man's essential nature is spiritual and wholly good; that matter, evil, disease and sickness are unreal—illusions existing only through ignorance of God. Therefore Christian Scientists renounce for themselves medicine, surgery and drugs and rely on healing through prayer."

The name of the movement seems misleading since it has nothing to do with any of the natural sciences of which Mrs. Eddy had no first-hand knowledge. In using the word, Mrs. Eddy meant that the teaching and acts of Jesus were rooted in unchanging divine law. Mrs. Eddy was at first interested in Spiritualism and afterwards, having been a patient of a faith-healer named Quimby, claimed to have been divinely healed.

There is a good deal of controversy about the efficacy of the Christian Science methods. In principle believers argue that if one has total, unquestioned faith in the healing power of Christ, then all sickness will be revealed as illusion and vanish. The trouble of course is that total faith is almost impossible to achieve, and hence even Christian Scientists inevitably fall ill and die. This makes the Church's argument irrefutable, but there is some evidence that the argument is convincing fewer individuals than it once did. On the other hand the growth of interest in "divine healing" within the more orthodox churches has led to a softening of barriers between Mrs. Eddy's splinter group and the hard-core Christian religions. Christian Science may well fade away after handing over to orthodoxy its single key concept.

Christian Socialism, a movement launched in 1848, a year of revolutions throughout the continent, by a group in England designed to commit the Church to a programme of social reform. The leaders, notably J. F. D. Maurice, Charles Kingsley (both Anglican clergymen), and John Ludlow were deeply moved by the wretched conditions of the British working class and the two priests had, indeed, given active support to the Chartist movement (*q.v.*). However, all insisted that socialism in its existing forms ignored the spiritual needs of mankind and must be tempered with Christianity. Tracts were written to expose the sweated industries, the consequences of unrestrained competition, and the evils following the enclosure system; but, more concretely, Christian socialism fostered co-operative workshops and distributive societies based on those of the Rochdale pioneers, organised a working-man's college and set up elementary classes for education. It also supported the trade-union movement's right to organise and bargain for its members.

The traditions of Christian socialism have



been carried on by the Fabian Society, by adherents of Guild Socialism, and by individuals who reject Marx's teaching of revolutionary change, and seek to bring it about by the methods of action through political parties, education, and encouragement of the unions. They believe that Christ's teachings can only be fully realised in a new society since Christianity implies social responsibility, and material factors are admitted to have an important bearing on the ability to lead a truly religious life. In the U.S.A. the eminent theologians Paul Tillich and Reinhold Niebuhr support these views. The factory-padre in Britain and the Catholic worker-priests of France bear evidence to the continuing influence of the early movement. In England the Christian Socialist Movement (CSM) was revived in 1960 by the coming together of organisations like the Socialist Christian League and the Society for Socialist Clergy and Ministers. *See also* Fabian Society, Guild Socialism.

Church of England. There is some evidence of possible continuity with the Christianity of Roman Britain, but in the main the Church derives from the fusion of the ancient Celtic church with the missionary church of St. Augustine, who founded the See of Canterbury in A.D. 597. To archbishop Theodore in 673 is ascribed its organisation in dioceses with settled boundaries, and in parishes. St. Augustine's church was in communion with Rome from the first, but the Church of England was not brought within papal jurisdiction until after the Norman conquest, and was at no time under the complete domination of Rome. It remains the Catholic Church of England without break of continuity, but during the Reformation the royal supremacy was accepted and that of the pope repudiated. It is the Established Church (i.e., the official church of the realm), crowns the sovereign, and its archbishops and bishops in the House of Lords can act as a kind of "conscience of the state" at every stage of legislation. The policy of religious toleration has been accepted since the 16th cent. The Church is organised in two ecclesiastical provinces (Canterbury and York) and 43 dioceses. Its form of worship is embodied in the Book of Common Prayer.

The Anglican Communion comprises the churches in all parts of the world which are in communion with the Church of England. All the bishops of the Anglican Communion meet every ten years in the Lambeth Conference (first held in 1867), over which the Archbishop of Canterbury by custom presides as *primus inter pares*. The theme of the 1968 Conference was "The Renewal of the Church," and for the first time observers and laymen were admitted.

Church of Scotland, the established national church of Scotland, presbyterian in constitution, and governed by a hierarchy of courts—the kirk-sessions, the presbyteries, the synods, and the General Assembly. *See* Presbyterianism.

Clairvoyance. *See* Telepathy.

Communism, ideally refers to the type of society in which all property belongs to the community and social life is based on the principle "from each according to his ability, to each according to his needs." Since no such society as yet exists, the word in practice refers to the attempt to achieve such a society by initially overthrowing the capitalist system and establishing a dictatorship of the proletariat. The modern movement is based on Marxism as further developed by Lenin who applied Marx's analysis to the new conditions which had arisen in 20th cent. capitalist society. Communists believe that their first task is the establishment of socialism under which there remain class distinctions, private property to some extent, and differences between manual and brain workers. The state is regulated on the basis "from each according to his ability, to each according to his work." In time this gives place to communism as described above. Marxism–Leninism develops continuously with practice since failure to apply its basic principles to changed circumstances and times would result in errors of dogmatism. Mao Tse-tung worked out the techniques of revolutionary action appropriate to China; Che Guevara the guerrilla tactics appropriate to the peasants of Latin America. His counsel "It is not necessary to wait until conditions for making revolution exist; the insurrection can create them," was the opposite of Mao Tse-tung's "Engage in no battle you are not sure of winning," and Lenin's "Never play with insurrection." Two fundamental principles of communism are (1) peaceful co-existence between countries of different social systems, and (2) the class struggle between oppressed and oppressing classes and between oppressed and oppressor nations. China, for example, holds that it is a mistake to lay one-sided stress on peaceful transition toward socialism otherwise the revolutionary will of the proletariat becomes passive and unprepared politically and organisationally for the tasks ahead. *See also* Maoism, Marxism, Trotskyism.

Confucianism. Confucius (Latinised form of K'ung-Fu-tzu) was born in 551 B.C. in the feudal state of Lu in modern Shantung province. He was thus a contemporary of Buddha, although nobody could have been more dissimilar. Where Buddha was metaphysical in his thought, Confucius was practical; Buddha was original, Confucius had hardly an original idea in his head; Buddha wanted to convert individuals to an other-worldly philosophy, Confucius wanted to reform the feudal governments of his time, believing that in this way their subjects would be made happier. Other religions have, in their time, been revolutionary; Confucius was a conservative who wanted to bring back a golden age from the past. The only respect in which Confucius agreed with the Buddha was that neither was particularly interested in the supernatural, and God or gods played little part in their religions.

Much of his time was spent in going from the court of one feudal lord to another trying to impress them by his example. For he suffered from the curious belief that the example set by the ruler influences his subjects. He made much of etiquette, trembling and speaking in low tones before princes, at ease and polite with his equals, and behaving with "lofty courtesy" to his inferiors. Promoting the idea of "the golden mean," he was not impressed by heroic deeds or unusual people, and was greatly displeased when he heard that a truthful son had reported that his father had stolen a sheep: "Those who are upright," he said, "are different from this; the father conceals the misconduct of the son, and the son conceals the misconduct of the father." One feels that Confucius would have felt not at all out of place in an English public school. Virtue brings its own reward in this world, ceremonial is important, politeness when universal would reduce jealousy and quarrels; "reverence the spirits but keep them far off." Destiny decides to what class a man shall belong, and as destiny is but another name for Nature prayer is unnecessary, for once having received his destiny, a man can demand and obtain from Nature what he chooses—his own will determines all things.

Although not very successful in his lifetime so far as the rulers were concerned, Confucius had numerous disciples who collected his teachings which are found, together with those of his later follower Mencius (372–289 B.C.), in the *Wu Ching* (five classics), and the *Shih Shu* (four books) which contain the Analects, The Great Learning, The Doctrine of the Mean, and the Book of Mencius. In time Confucianism became with Taoism and Buddhism one of the main religions in China. Unlike Buddhism it had little influence elsewhere. Chinese philosophy students today look upon Confucius as "a forefather of all reactionaries."

Congregationalists, the oldest sect of Nonconformists who hold that each church should be independent of external ecclesiastical authority. They took their origin from the Brownists of Elizabeth's days. Robert Browne (*c.* 1550–*c.* 1633), an Anglican clergyman, who had come to reject bishops, was forced with his followers to seek refuge, first in Holland and then in Scotland where he was imprisoned by the Kirk. In later life he changed his views and is disowned by Congregationalists because of his reversion to Anglicanism. His former views were spread by Henry Barrow and John Greenwood who, under an Act passed in 1592 "for the punishment of persons obstinately refusing to

come to church" (and largely designed for the suppression of this sect), were hanged at Tyburn. They had preached (*a*) that the only head of the church is Jesus Christ; (*b*) that, contrary to Elizabethan doctrine, the church had no relationship to the state; (*c*) that the only statute-book was the Bible whereas the Articles of Religion and the Common Prayer were mere Acts of Parliament; (*d*) that each congregation of believers was independent and had the power of choosing its own ministers. The body fled once more to Holland and were among the Pilgrims who set sail in the *Mayflower* for America in 1620 whilst those who remained were joined by Puritans fleeing from Charles I. They became free once more to live in England under the Commonwealth only to be repressed again under Charles II. Finally full liberty of worship was granted under William III. In 1833 the Congregational Union of England and Wales was formed which has no legislative power. It has issued a Declaration of Faith by which no minster is bound; he is responsible to his own church and to nobody else. The sect is widespread both in Britain and the U.S.A. where it is held in special honour because of its connection with the Pilgrim Fathers. In 1972 the Congregational Church in England and Wales and the Presbyterian Church of England decided to unite to form the United Reformed Church.

Conservatism. The name "Conservative" came into general use after 1834 in place of the older name of "Tory," although "Tory democracy" is now widely used to describe Conservative social reform policy. Originally the party of the aristocracy and landed gentry, Conservatism has been supported from the end of the 19th cent. by the large business interests, and more recently by lower-income groups in the population. Although originally based upon the teachings of Burke and Disraeli, Conservative doctrine has been considerably modified since 1945. The Conservatives increased their parliamentary strength in three successive general elections from 1951–59, but were defeated by Labour in 1964 and 1966. Contrary to all the findings of the pre-election polls, this trend was reversed in 1970 when the Conservatives regained power with a substantial majority. On the continent, Conservatism has generally been identified with fear of social progress, exaggerated respect for authority, and nationalism; such parties have more often than not been extremely reactionary and anti-democratic. *See also* Section C, Part I.

Coptic Church, the sect of Egyptian Christians who, holding "Monophysite" opinions (*i.e.*, refusing to grant the two natures, God and Man, of Christ), were declared heretical by the Council of Chalcedon in 451. They practise circumcision and have dietary laws. Their language is a direct descendant of ancient Egyptian. Like the Armenians, they are regarded as an heretical branch of Eastern Christianity. Their religious head is the patriarch of Alexandria.

Cynics, a school of philosophy founded in the time of Alexander the Great by Diogenes. Choosing to live like a dog by rejecting all conventions of religion, manners, or decency, and allegedly living in a tub, Diogenes unwittingly brought on his school the title "Cynic," meaning not "cynical," as the word is understood today, but "canine." His teacher, Antisthenes, who had been a disciple of Socrates, decided, after the latter's death, that all philosophy was useless quibbling and man's sole aim should be simple goodness. He believed in a return to nature, despised luxury, wanted no government, no private property, and associated with working men and slaves. Far from being cynics in the modern sense, Diogenes and Antisthenes were virtuous anarchists rather like old Tolstoy (except that in the practice of their beliefs they were more consistent).

D

Darwinism. *See* Section F, Part IV. *See also* Vitalism.

Deism. *See* God and Man.

Demonism, Demons, and the Devil. Demons are ethereal beings of various degrees of significance and power which are believed to be implicated in men's good, but especially evil, fortune. They are common to most cultures. From the anthropological point of view the demon arose as a widespread concept in the following ways: (1) as a psychological projection into the outer world of man's own good or evil emotions and thoughts; (2) as a survival of primitive animism (*q.v.*), thus spirits are believed to haunt places, trees, stones, and other natural objects; (3) when by warlike invasion the gods of the vanquished become the devils of the conquerors (as when the Jews occupied Canaan); (4) as a primitive belief that spirits of the dead continue after death to hover near their former habitation, and not always entirely welcome to the living; (5) the conception of a supreme source of evil (the Devil or Satan) which took shape among the Jews during their sojourn in Babylon under the influence of Zoroastrianism (*q.v.*), a religion in which the struggle between the two spirits, Good and Evil, reached its height in the imagination of the ancient world. The Satan of the Old Testament was first regarded as one of God's servants (in the Book of Job he goes up and down the earth to see whether God's commands are obeyed), but when the Jews returned from their captivity he had become identified with Ahriman, the spirit of evil, who was in continual conflict with Ahura Mazda, the spirit of good. As Dr. Margaret Murray has pointed out, the primitive mind ascribed both good and evil to one power alone; the division into God and the Devil, priest and witch, belongs to a higher stage of civilisation. The worship of evil itself, or of its personification in Satan, is a curious practice which seems to have developed hand-in-hand with Christianity and to have received steady support from a small but measurable minority. Many of the ceremonies involved in Satanism or in the so-called Black Mass appear to have been no more than opportunities for sexual excesses of one kind or another—such indulgences being traditionally barred to devout Christians. The alleged power of sex as a form of magic was propagated by the talented but rather mad poet, Aleister Crowley (1875–1947), who scandalised pre-war Europe with his very well-publicised dabblings into Satanism. The self-styled "wickedest man in the world," Crowley was a pathetic rather than shocking figure and died a drug addict. He can hardly be said to have significantly advanced the cause of Demonology, though it has to be admitted that he tried very hard. *See also* Witchcraft, Magic.

Determinism and Free-will. The question of whether man is, or is not, free to mould his own destiny is one which has exercised the minds of philosophers since Greek mythology conceived of the Fates as weaving a web of destiny from which no man can free himself. Socrates emphasised that man could through knowledge influence his destiny whilst ignorance made him the plaything of fate; Plato went further in pointing out that man can, and does, defeat the purposes of the universe and its divine Creator. It is our duty to live a good life, but we can live a foolish and wicked one if we choose. Aristotle wrote "Virtue is a disposition or habit involving deliberate purpose or choice." If this were not so morality would be a sham.

The Problem for Theology. The last of the great philosophers of antiquity and one of the great influences in moulding Catholic theology was Plotinus (*c.* 204–270). Soul, he taught, is free, but once enmeshed in the body loses its freedom in the life of sense. Nevertheless, man is free to turn away from sensuality and towards God who is perfect freedom; for even when incarnated in matter the soul does not entirely lose the ability to rescue itself. This conception was carried over into the beliefs of the Early Christian Apologists because it appeared to be in line with the teaching of Jesus that He had come to save man from sin. Sin implies guilt, and guilt implies the freedom to act otherwise; furthermore an all-good God cannot be responsible for the sin in the world which must be man's responsibility and this again implies freedom. Pelagius (*c.* 355–*c.* 425),

a Welsh priest, not only believed in freewill but, questioning the doctrine of original sin, said that when men act righteously it is through their own moral effort, and God rewards them for their virtues in heaven. This belief became fairly widespread and was declared a heresy by the Church, being attacked notably by St. Augustine (354–430), a contemporary of Pelagius, who believed in predestination—that, since the sin of Adam, God had chosen who in all future history would be saved and who damned. This represents one tradition in Christianity: the determinism which leads to Calvinism (*q.v.*). St. Thomas Aquinas (1227–74), the greatest figure of scholasticism and one of the principal saints in the Roman Catholic Church, compromised between the two positions in the sense that, believing man to be free, he yet held that Adam's sin was transmitted to all mankind and only divine grace can bring salvation. But even when God wishes to bestow this salvation, the human will must co-operate. God foresees that some will not accept the offer of grace and predestines them to eternal punishment.

The Problem for Philosophy. With the Renaissance, thinkers began to free themselves from the domination of the Church and to study the world objectively and freely without preconceptions. But the more man turned to science, the more he discovered that the world was ruled by apparently inexorable laws and, since the scientist must believe that every event has a cause, he was led back to determinism. Man as part of the universe was subject to law too and all that existed was a vast machine. Francis Bacon (1561–1626) separated the fields of religion and science but left man subject completely to the will of God. Thomas Hobbes (1588–1679) was a rigid determinist and materialist although, having had trouble with the church in France whence, as a royalist, he had fled, he took care to announce that the Christian God is the Prime Mover.

Modern philosophy begins with René Descartes (1596–1650), a Frenchman who tried to reconcile the mechanical scientific universe of his time with the spiritual need for freedom. He did this by separating completely mind and body; the former, he said, is free, the latter completely determined. But, by admitting that the will can produce states of body, he was left with the problem of how this could happen—a problem which the so-called Occasionists solved to their own satisfaction by stating that the will is free and God so arranges the universe that what a person wills happens. Baruch Spinoza (1632–77), a Dutch Jew whose independence of thought had led to his excommunication from the Amsterdam Synagogue in 1656, was a complete determinist. He asserted that God and Nature are one, everything that happens is a manifestation of God's inscrutable nature, and it is logically impossible that things could be other than they are. Thus both Hobbes and Spinoza were determinists for entirely opposed reasons. The former as a materialist, the latter because he believed in the absolute perfection and universality of God. Yet the great religious mystic and mathematician Blaise Pascal (1623–62) held that, no matter what reason and cold logic may indicate we *know* from direct religious experience that we are free. John Calvin (1509–64) and Martin Luther (1483–1546) were both determinists. *See* Calvinism, Lutheranism.

To the more practical British philosophers, John Locke (1632–1704) and David Hume (1711–76), free-will was related to personality. Locke believed that God had implanted in each individual certain desires and these determine the will; the desires are already there, but we use our will to satisfy them. Hume argued that a man's behaviour is the necessary result of his character and if he had a different character he would act otherwise. Accordingly, when a man's actions arise from his own nature and desires he is free. He is not free when external events compel him to act otherwise (*e.g.*, if he strikes another because his own nature is such he is free as he is not if he is compelled to do so against his desire). Leibnitz (1646–1716), although as a German metaphysical philosopher holding very different general views, said much the same thing—that choice is simply selecting the desire that is strongest. But most of the 18th cent. from Voltaire onwards, with the great exceptions of Rousseau and the later German philosophers Kant, Fichte, Schopenhauer, and Hegel, who were initially influenced by him, accepted determinism. Rousseau (1712–78) began to stem the tide by his declaration that man is a free soul striving to remain free and only prevented from being so by society and the cold science which stifles his feeling heart. Once again the will became important as Kant (1724–1804) asserted that belief in freedom is a moral necessity although it cannot be proved by reason; the moral nature of man shows that there is a "transcendental" world beyond the senses where freedom applies. Fichte and Schelling found freedom in the Absolute ego or God of whom each individual was part and thus also free. Hegel (1770–1831) saw the whole universe as evolving towards self-awareness and freedom in man although this could only be fully realised in a society that makes for freedom. Even God himself only attains full consciousness and self-realisation through the minds of such individuals as are free. This is the goal of the dialectical process. (*See* Dialectical Materialism.)

The Scientist's View. For the scientist the law of cause and effect is a useful hypothesis since, by and large, it is necessary for him to assume that all events are caused. Nevertheless the modern tendency is to think in terms of statistical probability rather than relentless mechanistic causality, and, although the free-will problem does not concern the scientist as such, it is clear that freedom and determinism (assuming the terms to have any meaning at all) are not necessarily opposed. In sociology, for example, we *know* that certain actions will produce certain results upon the behaviour of people in general, *e.g.*, that raising the bank rate will discourage business expansion. But this does not mean that Mr. Brown who decides in the circumstances not to add a new wing to his factory is not using his free-will. Even in the case of atoms, as Dr. Bronowski has pointed out, the observed results of allowing gas under pressure in a cylinder to rush out occur because most of the atoms are "obeying" the scientific "law" relating to such situations. But this does not mean that some atoms are not busy rushing across the stream or even against it—they are, but the general tendency is outwards and that is what we note. Lastly, the modern philosophical school of Logical Analysis would probably ask, not whether Free-will or Determinism is the true belief, but whether the question has any meaning. For what scientific experiment could we set up to prove one or the other true? The reader will note that some of the philosophers mentioned above are using the words to mean quite different concepts.

Dialectical Materialism, the combination of Hegel's dialectic method with a materialist philosophy produced by Karl Marx (1818–83) and his friend Friedrich Engels (1820–95). It is the philosophical basis of Marxism (*q.v.*) and Communism (*q.v.*). "Dialectic" to the ancient Greek philosophers meant a kind of dialogue or conversation, as used particularly by Socrates, in which philosophical disputes were resolved by a series of successive contradictions: a thesis is put forward and the opposing side holds its contradiction or antithesis until in the course of argument a synthesis is reached in which the conflicting ideas are resolved.

From Thesis through Antithesis to Synthesis. Hegel in the 19th cent. put forward the view that this process applies to the course of nature and history as they strive towards the periect state. But to him, as to the Greeks, the conflict was in the field of ideas. The "universal reason" behind events works through the ideas held by a particular society until they are challenged by those of another which supersedes them and in turn, usually by war, becomes the agent of universal reason until the arrival of a new challenger. Hegel therefore regarded war as an instrument of progress and his Prussian compatriots found no difficulty in identifying their own state as the new agent of progress by universal conquest. Feuerbach,

Lassalle, and other early socialists were impressed by some of Hegel's ideas: *e.g.*, that societies evolved (with the assumption that finally their own ideal society would be achieved) and that truth, morals, and concepts were relative so that a type of society that was "good" at one time was not necessarily so at another. But Marx and Engels in effect turned Hegel upside-down, accepted his dialectic but rejected his belief that ideas were the motive force. On the contrary, they said, ideas are determined by social and economic change as a result of materialistic forces. (*See* **Calvinism**, where it is pointed out that the Marxist view is not that Calvin changed men's economic ideas but rather that a developing capitalism unconsciously changed his.) The historical materialism of Marxism purports to show that the inexorable dialectic determines that feudalism is displaced by capitalism and capitalism by creating a proletariat (its antithesis) inevitably leads to socialism and a classless society. The state, as a tool of the dominant class, withers away. Dialectical materialism is applied in all spheres. As a philosophy there is little to be said for it save that it has shown us the close dependence of man's thoughts upon current material and social conditions. But as a battle-cry or a rationalisation of Marxism it wields immense power over the minds of men. *See* **Marxism**.

Dianetics. *See* **Scientology.**

Diggers, one of the many sects which flourished under the Commonwealth (others were the Muggletonians, the Levellers, the Millenarians, and the Fifth Monarchy Men), so-called because they attempted to dig (*i.e.* cultivate) untilled land. Gerrard Winstanley, a profoundly religious man, and leader of the Diggers, believed in the economic and social equality of man and castigated the clergy for upholding the class structure of society. In his book *The True Leveller's Standard Advanced* (1649) he wrote: "Every day poor people are forced to work for fourpence a day, though corn is dear. And yet the tithing priest stops their mouth and tells them that 'inward satisfaction of mind' was meant by the declaration 'the poor shall inherit the earth'. I tell you, the Scripture is to be really and materially fulfilled. You jeer at the name 'Leveller'; I tell you Jesus Christ is the Head Leveller."

Doukhobors, a religious sect of Russian origin, founded by a Prussian sergeant at Kharkov in the middle of the 18th cent., and now mainly settled in Canada. Like many other sects they belong to that type of Christianity which seeks direct communication with God and such bodies tend to have certain traits in common such as belief in the "inner light," opposition to war and authority in general, and often ecstasies which show themselves in physical ways such as shaking, speaking in strange tongues (glossolalia), and other forms of what to the unbeliever seem mass hysteria. Liturgy, ritual, or ceremony is non-existent. The Doukhobors were persecuted in Tsarist Russia, but in 1898 Tolstoy used his influence to have them removed to Canada where the government granted them uninhabited land in what is now Saskatchewan and seven or eight thousand settled down in peace which they enjoyed for many years. Recently, however, their practices have caused difficulties once more; for even the most tolerant government which is prepared to accept pacifism, total dependence on communally-owned agriculture, refusal to engage in commerce, non-payment of taxes, rejection of the marriage ceremony and separation "when love ceases," finds it difficult to tolerate, as civilisation advances ever closer to Doukhobor communities, their proneness to "put off these troublesome disguises which we wear"—*i.e.*, to walk about naked in the communities of their more orthodox neighbours. What the future of the Doukhobors in their various sects (for even they have their differences) will be it is impossible to say, but it is difficult to believe that these simple people can long resist the pressure of modern civilisation.

Dowsing. *See* **Radiesthesia.**

Druidism, the religion of Celtic Britain and Gaul of which Druids were the priesthood. They were finally wiped out by the Roman general Suetonius Paulinus about A.D. 58 in their last stronghold, the island of Anglesey There are two sources of our present beliefs in Druidism: (1) the brief and factual records of the Romans, notably Pliny and Julius Caesar, which tell us that they worshipped in sacred oak groves and presumably practised a religion doing reverence to the powers of nature which must have had its roots in early stone age times and had many cruel rites, *e.g.*, human sacrifice; (2) the beliefs put forward by William Stukeley, an amateur antiquarian who from 1718 did valuable work by his studies of the stone circles at Stonehenge and Avebury. However, influenced by the Romantic movement, he later put forward the most extravagant theories which unfortunately are those popularly accepted by those without archaeological knowledge today. Stonehenge and Avebury were depicted as the temples of the "white-haired Druid bard sublime" and an attempt was made to tie up Druidism with early Christianity, above all with the concept of the Trinity. In fact, these circles have no connection with the Druids. They may have made ceremonial use of them but recent evidence suggests that the megalithic stones at Stonehenge (I.110) belong to a Bronze Age culture (2100–1600 B.C.). Nor have Druidism and Christianity any relationship. Almost nothing is known of the religion. Yet such were its romantic associations that, even today, one hears of "Druidic" ceremonies practised at the appropriate time of year on Primrose Hill in the heart of London (though whether seriously or with tongue in cheek one does not know). In Wales the name Druid survives as the title for the semi-religious leaders of the annual festivals of Celtic poetry, drama, and music known as Eisteddfods. Lingering, but now tenuous, druidic connections are to be found in all Celtic parts including Cornwall and Brittany, where Eisteddfods are also held.

Dualism, any philosophical or theological theory which implies that the universe has a double nature, notably Plato's distinction between appearance and reality, soul and body, ideas and material objects, reason and the evidence of the senses, which infers that behind the world as we perceive it there lies an "ideal" world which is more "real" than that of mere appearance. In religions such as Zoroastrianism or the Gnostic and Manichaeism heresies, it was believed that the universe was ruled by good and evil "principles"—in effect that there was a good God and a bad one. In psychology, dualism refers to the philosophical theories which believe mind and body to be separate entities. The opposite of dualism is monism which asserts the essential unity of the substance of the universe.

An essential problem in the dualistic view lies in the question as to how and where the two separate and distinct properties of the universe interact. Where, for example, does the "mind" actually mesh with the physical mechanics of the brain and body—where does the ghost sit in his machine? Descartes decided that mind and body must interact somewhere and he selected the pineal gland (an apparently functionless part of the brain) as the spot. But this did nothing to explain how two *totally different* aspects of nature can possibly influence each other, and today most philosophers and psychologists reject dualistic views of life and personality as posing more problems than they solve. *See also* **Psychology, Occam's Razor.**

E

Ecomovement. In the early 1970s widespread publicity was for the first time given to the urgent warnings of ecologists that the current exponential increase in (a) world population, (b) depletion of natural resources, and (c) pollution of the environment, could not continue without global catastrophe. The most significant single event in the evolution of what is now being known as the "ecomovement" was probably the publication of the Club of Rome's

paper on *The Limits to Growth*. From this sprang a movement, unfortunately initially drawn only from the middle class and better educated, which aimed to reduce environmental pollution, the extravagances of advertising and needless waste of natural resources. Its first campaigns were directed against such obvious targets as disposable glass bottles and unnecessary packaging and wrapping in shops and supermarkets. The ecomovement also protests against industrial firms which pollute rivers and seas, against aircraft noise and waste in general. Its early campaigns were greeted with some derision but have achieved dramatic point with the world energy and economic crisis which developed towards the end of 1973.

Ecumenism, a world movement which springs from the Christian belief that all men are brothers and that the Christian Church should be re-structured to give reality to the belief. Christ's church exists not to serve its own members, but for the service of the whole world. Some see the answer in a united church of a federal type (unity in diversity), others in an organic structure with one set of rules. The period since the convening of the Second Vatican Council by Pope John has been one of fervent discussion among Christian theologians with the aim of promoting Christian unity. *See* World Council of Churches.

Education. Education was no great problem to primitive man, but as societies became more complex people began to ask themselves such questions as: *What* should young people be taught? *How* should they be taught? Should the aim of their education be to bring out their individual qualities or rather to make them good servants of the state?

The first teachers were priests who knew most about the traditions, customs, and lore of their societies and thus the first schools were in religious meeting places. This was notably true of the Jews who learned from the rabbis in the synagogue, and throughout the Middle Ages in Christendom as will be seen later.

The Greeks. We begin, as always, with the Greeks whose city-states, based on slavery, educated men (not women) for the sort of life described in Plato's *Dialogues*—the leisured life of gentlemen arguing the problems of the universe at their banquets or in the market-place. This made it necessary to learn debate and oratory (or rhetoric) especially for those who proposed to take up politics. The Sophist philosophy taught the need to build up convincing arguments in a persuasive manner, to learn the rules of logic and master the laws and customs of the Athenians, and to know the literature of the past so that illustrations might be drawn from it. These strolling philosophers who taught for a fee were individualists showing the student how to advance himself at all costs within his community.

Socrates had a more ethical approach, believing that education was good in itself, made a man happier and a better citizen, and emphasised his position as a member of a group. His method of teaching, the dialectic or "Socratic" method, involved argument and discussion rather than overwhelming others by rhetoric and is briefly mentioned under Dialectical Materialism (*q.v.*). Today this method is increasingly used in adult education where a lecture is followed by a period of discussion in which both lecturer and audience participate; for psychologists have shown that people accept ideas more readily when conviction arises through their own arguments than when they are passively thrust down their throats.

Socrates' pupil Plato produced in his book *The Republic* one of the first comprehensive systems of education and vocational selection. Believing that essentially men have very different and unequal abilities he considered that in an idealistic or utopian society they should be put into social classes corresponding to these differences, and suggested the following method: (1) For the first 18 years of a boy's life he should be taught gymnastics and sports, playing and singing music, reading and writing, a knowledge of literature, and if he passed this course sent on to the next stage; those who failed were to become tradesmen and merchants. (2) From 18–20 those successful in the first course were to be given two years of cadet training, the ones thought incapable of further education being placed in the military class as soldiers. (3) The remainder, who were to become the leaders of society, proceeded with advanced studies in philosophy, mathematics, science, and art. Such education was to be a state concern, state supported and controlled, selecting men and training them for service in the state according to their abilities.

Plato's pupil Aristotle even suggested that the state should determine shortly after birth which children should be allowed to live and destroy the physically or mentally handicapped; that marriage should be state-controlled to ensure desirable offspring. However, in their time the leisured and individualistic Sophists held the field and few accepted the educational views of Plato or his pupil.

Rome. The Romans were not philosophers and most of their culture came from Greece. Administration was their chief aptitude and Quintilian (A.D. *c.* 35–*c.* 95) based his higher education on the earlier classical tuition in public speaking, but he is important for emphasising the training of character and for his humanistic approach to the method of teaching that caused his *Institutio oratoria* to be influential for centuries later—indeed one might almost say up to the time of the great Dr. Arnold of Rugby. Education, he believed, should begin early but one must "take care that the child not old enough to love his studies does not come to hate them" by premature forcing; studies must be made pleasant and interesting and students encouraged by praise rather than discouraged when they sometimes fail; play is to be approved of as a sign of a lively disposition and because gloomy, depressed children are not likely to be good students; corporal punishment should never be used because "it is an insult as you will realise if you imagine it yourself." The world became interested not in *what* he taught but *how* he taught it; he was the pioneer of humanistic education and character-training from Vittorino da Feltre (1378–1446) of Mantua, through Milton and Pope who commended his works, to the modern educationists who have studied their pupils as well as their books.

The Middle Ages: The Religious View. With the development of Christianity education once more became a religious problem. The earliest converts had to be taught Christian doctrine and were given instruction in "catechumenal" schools before admission to the group, but as the religion came increasingly into contact with other religions or heresies a more serious training was necessary, and from these newer "catechetical" schools, where the method used was the catechism (*i.e.*, question and answer as known to all Presbyterian children today), the Apologists arose among whom were Clement of Alexandria and the great Origen. From this time education became an instrument of the church and in 529 the Emperor Justinian ordered all pagan schools to be closed.

As typical of the best in mediaeval education whilst the lamp of civilisation burned low during the Dark Ages, after the fall of Roman power, and survived only in the monasteries, we may mention St. Benedict (*c.* 480–*c.* 547) of Monte Cassino. There, in southern Italy, a rule was established which became a part of monastic life in general. Monastic schools were originally intended for the training of would-be monks, but later others were admitted who simply wanted some education; thus two types of school developed one for the *interni* and the other for *externi* or external pupils. Originally studies were merely reading in order to study the Bible, writing to copy the sacred books, and sufficient calculation to be able to work out the advent of holy days or festivals. But by the end of the 6th cent. the "seven liberal arts" (grammar, rhetoric, dialectic, arithmetic, geometry, music, and astronomy) were added.

The Renaissance. The close of the Middle Ages saw the development of two types of secular school. One came with the rise of the new merchant class and the skilled trader whose "guilds" or early trade unions established

schools to train young men for their trades but ultimately gave rise to burgher or town schools; the other was the court school founded and supported by the wealthy rulers of the Italian cities—Vittorino da Feltre (mentioned above) presided over the most famous at Mantua.

These Renaissance developments are paralleled in northern Europe by the Protestant reformers who, having with Martin Luther held that everyone should know how to read his Bible in order to interpret it in his own way, were logically committed to popular education, compulsory and universal. In theory this was intended for biblical study, but writing, arithmetic, and other elementary subjects were taught and Luther said that, even if heaven and hell did not exist, education was important. Universal education is a Protestant conception.

Views of Philosophers. From this period onwards people were free to put forward any ideas about education, foolish or otherwise, and to create their own types of school. Of English philosophers who theorised about, but did not practise, education we may mention the rationalist Francis Bacon (1561–1626) who saw learning as the dissipation of all prejudices and the collection of concrete facts; the materialist and totalitarian Hobbes (1588–1679) who, as a royalist, believed that the right to determine the kind of education fit for his subjects is one of the absolute rights of the sovereign power or ruler; the gentlemanly Locke (1632–1704) whose ideal was a sound mind in a sound body to be attained by hard physical exercise, wide experience of the world, and enough knowledge to meet the requirements of the pupil's environment. The end result would be one able to get on with his fellows, pious but wise in the ways of the world, independent and able to look after himself, informed but reticent about his knowledge. Classics and religious study were not to be carried to excess, since Locke held that these subjects had been overrated in the past. Locke's pupil was the well-to-do, civilised young man of the 17th cent. who knew how to behave in society.

Jean-Jacques Rousseau (1712–78), a forerunner of the Romantic movement (*q.v.*), which despised society and its institutions, put emotion at a higher level than reason. His book *Emile* describes the education of a boy which is natural and spontaneous. Society, he holds, warps the growing mind and therefore the child should be protected from its influences until his development in accordance with his own nature is so complete that he cannot be harmed by it. During the first 4 years the body should be developed by physical training; from 5 to 12 the child would live in a state of nature such that he could develop his powers of observation and his senses; from 13 books would be used and intellectual training introduced, although only in line with the child's own interests, and he would be given instruction only as he came to ask for it. Moral training and contact with his fellows to learn the principles of sympathy, kindness, and helpfulness to mankind would be given between 15 and 20. Girls, however, should be educated to serve men in a spirit of modesty and restraint. His own five children he deposited in a foundling hospital.

Summary. Broadly speaking, then, there have been four main attitudes to education: (1) religious, with a view to a life beyond death; (2) state-controlled education, with a view to uniform subservience to authority; (3) "gentlemanly" education, with a view to social graces and easy congress in company; (4) the "child-centred" education, which attempts to follow the pupil's inner nature. It is unnecessary to mention the ordinary method of attempting to instil facts without any considerable degree of co-operation between pupil and teacher in order that the former may, with or without interest, follow some occupation in adult life; for this the philosophers did not consider. Today there remain the two fundamental principles: education for the advantage of the state and its ideology or education for individual development and freedom.

Four educationists of the modern period who have influenced us in the direction of freedom were Johann Pestalozzi of Switzerland (1746–1827) who, by trying to understand children, taught the "natural, progressive, and harmonious development of all the powers and capacities of the human being"; Friedrich Froebel (1782–1852) of Germany, the founder of the Kindergarten who, like Pestalozzi, was influenced by Rousseau but realised the need to combine complete personal development with social adjustment; Maria Montessori (1869–1952) whose free methods have revolutionised infant teaching; John Dewey (1859–1952) who held that the best interests of the group are served when the individual develops his own particular talents and nature.

Eleatics, the philosophers of Elea in ancient Greece who, at the time when Heraclitus (*c.* 535–475 B.C.) was teaching that change is all that exists and nothing is permanent, were asserting that change is an illusion. Of the three leaders of this school, Xenophanes asserted that the universe was a solid immovable mass forever the same; Parmenides explained away change as an inconceivable process, its appearance being due to the fact that what we see is unreal; and Zeno (the best-known today) illustrated the same thesis with his famous argument of the arrow which, at any given moment of its flight, must be where it is since it cannot be where it is not. But if it is where it is, it cannot move; this is based, of course, on the delusion that motion is discontinuous. The Eleatics were contemporaries of Socrates.

Empiricism. While not a single school of philosophy, empiricism is an approach to knowledge which holds that if a man wants to know what the universe is like the only correct way to do so is to go and look for himself, to collect facts which come to him through his senses. It is, in essence, the method of science as contrasted with rationalism (*q.v.*) which in philosophy implies that thinking or reasoning without necessarily referring to external observations can arrive at truth. Empiricism is typically an English attitude, for among the greatest empirical philosophers were John Locke, George Berkeley, and David Hume. *See* Rationalism.

Epicureanism. The two great schools of the Hellenistic period (*i.e.* the late Greek period beginning with the empire of Alexander the Great) were the Stoics and Epicureans, the former founded by Zeno of Citium (*not* to be confused with Zeno the Eleatic) (*q.v.*), the latter by Epicurus, born in Samos in 342 B.C. Both schools settled in Athens, where Epicurus taught that "pleasure is the beginning and end of a happy life." However, he was no sensualist and emphasised the importance of moderation in all things because excesses would lead to pain instead of pleasure and the best of all pleasures were mental ones. Pleasures could be active or passive but the former contain an element of pain since they are the process of satisfying desires not yet satiated. The latter involving the absence of desire are the more pleasant. In fact, Epicurus in his personal life was more stoical than many Stoics and wrote "when I live on bread and water I spit on luxurious pleasures." He disapproved of sexual enjoyment and thought friendship one of the highest of all joys. A materialist who accepted the atomic theory of Democritus, he was not a determinist, and if he did not disbelieve in the gods he regarded religion and the fear of death as the two primary sources of unhappiness.

Epiphenomenalism. *See* Mind and Body.

Erastianism, the theory that the state has the right to decide the religion of its members, wrongly attributed to Erastus of Switzerland (1524–83) who was believed to have held this doctrine. The term has usually been made use of in a derogatory sense—*e.g.*, by the Scottish churches which held that the "call" of the congregation was the only way to elect ministers at a time when, about the turn of the 17th and 18th cent., they felt that Episcopalianism was being foisted on them. "Episcopalianism" (*i.e.* Anglicanism) with its state church, ecclesiastical hierarchy, and system of livings presented by patrons was to them "Erastian" in addition to its other "unscriptural practices."

Essenes, a Jewish sect which, during the oppres-

sive rule of Herod (d. 4 B.C.), set up monastic communities in the region of the Dead Sea. They refused to be bound by the scriptural interpretations of the Pharisees and adhered rigorously to the letter of Holy Writ, although with additions of their own which cause them by orthodox Jews today to be regarded as a break-away from Judaism. Among their practices and beliefs were purification through baptism, renunciation of sexual pleasures, scrupulous cleanliness, strict observance of the Mosaic law, communal possession, asceticism. Akin in spirit, although not necessarily identical with them, were the writers of Apocalyptic literature preaching that the evils of the present would shortly be terminated by a new supernatural order heralded by a Messiah who would reign over a restored Israel. The casting out of demons and spiritual healing formed part of these general beliefs which were in the air at that time. The sect has an importance far beyond its size or what has been known about it in the past since the discovery from 1947 onwards of the Dead Sea Scrolls (*see* Section L) of the Qumran community occupying a monastery in the same area as the Essenes and holding the same type of belief. These scrolls with their references to a "Teacher of Righteousness" preceding the Messiah have obvious relevance to the sources of early Christianity and have given rise to speculations as to whether Jesus might have been influenced by views which, like His own, were unacceptable to orthodox Jews but in line with those of the Dead Sea communities. At the very least they seem to show that early Christianity was not a sudden development but a gradual one which had its predecessors.

Ethical Church, a movement typical of 19th cent. rationalism which attempted to combine atheism (or at any rate the absence of any belief in a God which was inconsistent with reason or based on revelation) with the inculcation of moral principles. Prayers were not used and ordinarily the service consisted in the singing of edifying compositions interspersed with readings from poems or prose of a similar nature by great writers holding appropriate views. It terminated in a talk on an ethical or scientific theme. There is an Ethical Church in London and the South Place Institution where Moncure Conway preached from 1864 to 1897 still exists.

Ethnocentrism, the exaggerated tendency to think the characteristics of one's own group or race superior to those of any others.

Eugenics, a 19th-cent. movement largely instigated by the British scientist and mathematician, Sir Francis Galton. Galton argued that many of the most satisfactory attributes of mankind—intelligence, physical strength, resistance to disease, etc.—were genetically determined and thus handed down in the normal process of inheritance. From this he reasoned that selective mating of physical "superior" individuals, and its converse, the controlled limitation on the breeding of criminals or the insane, would lead inevitably to a progressive improvement in the overall standards of the human race. In their simplest form these proposals are incontestable, though they do of course introduce marked restrictions on the choice of the individual for marriage and procreation. Worse yet is the way in which the argument can be misapplied or elaborated—as it was in Nazi Germany—to include the sterilisation of alcoholics, confirmed criminals and even epileptics. Nevertheless there remains the feeling that there are some aspects of eugenics which intuitively at any rate make good sense and of course the widespread application of birth control is itself an enactment of eugenic principles.

Evangelicanism, the belief of those Protestant sects which hold that the essence of the Gospel consists in the doctrine of salvation by faith in the atoning death of Christ and not by good works or the sacraments; that worship should be "free" rather than liturgical through established forms; that ritual is unacceptable and superstitious. Evangelicals are Low Churchmen.

Evangelism, the preaching of the Gospel, emphasising the necessity for a new birth or conversion. The evangelistic fervour of John Wesley and George Whitefield (*see* Methodism) aroused the great missionary spirit of the late 18th and 19th cent. George Fox, founder of the Society of Friends (*q.v.*), was also an evangelist. Evangelists can be Low, High, or Middle Churchmen.

Existentialism, a highly subjective philosophy which many people connect with such names as Jean-Paul Sartre (b. 1905) or Albert Camus (1913–60) and assume to be a post-war movement associated with disillusion and a sordid view of life. However, existentialism stems from Sören Kierkegaard (1813–55), the Danish "religious writer"—his own description of himself—in such works as *Either/Or*, *Fear and Trembling*, and *Concluding Unscientific Postscript*. Between the two wars translations of Kierkegaard into German influenced Martin Heidegger's (b. 1889) great work *Being and Time* and the other great existentialist Karl Jaspers (b. 1883); it has strongly influenced modern Protestant theology notably in Karl Barth, Reinhold Niebuhr, and Paul Tillich and beyond that field Gabriel Marcel (b. 1887), the Spanish writer Unamuno (1864–1936) in his well-known *The Tragic Sense of Life*, and Martin Buber of Israel (b. 1878) in his *I and Thou*. We have it on Heidegger's authority that "Sartre is no philosopher" even if it is to his works that modern existentialists often turn.

Existentialism is extremely difficult for the non-metaphysically-minded to understand; it deals, not with the nature of the universe or what are ordinarily thought of as philosophical problems but describes an attitude to life or God held by the individual. Briefly, its main essentials are: (1) it distinguishes between *essence*, *i.e.*, that aspect of an entity which can be observed and known—and its *existence*—the fact of its having a place in a changing and dangerous world which is what really matters; (2) existence being basic, each self-aware individual can grasp his own existence on reflection in his own immediate experience of himself and his situation as a free being in the world; what he finds is not merely a knowing self but a self that fears, hopes, believes, wills, and is aware of its need to find a purpose, plan, and destiny in life; (3) but we cannot grasp our existence by thought alone; thus the fact "all men must die" relates to the essence of man but it is necessary to be involved, to draw the conclusion as a person that "I too must die" and experience its impact on our own individual existence; (4) because of the preceding, it is necessary to abandon our attitude of objectivity and theoretical detachment when faced by the problems relating to the ultimate purpose of our own life and the basis of our own conduct; life remains closed to those who take no part in it because it can have no significance; (5) it follows that the existentialist cannot be rationalist in his outlook for this is merely an escape into thought from the serious problems of existence; none of the important aspects of life—failure, evil, sin, folly—nor (in the view of Kierkegaard) even the existence of God or the truth of Christianity—can be proved by reason. "God does not exist; He is eternal," was how he expressed it; (6) life is short and limited in space and time, therefore it is foolish to discuss in a leisurely fashion matters of life or death as if there were all eternity to argue them in. It is necessary to make a leap into the unknown, *e.g.*, accepting Christ (in the case of the Christian existentialist) by faith in the sense of giving and risking the self utterly. This means complete commitment, not a dependence on arguments as to whether certain historical events did, or did not, happen.

To summarise: existentialism of whatever type seems to the outsider to be an attitude to life concerning itself with the individual's ultimate problems (mine, not yours); to be anti-rationalist and anti-idealist (in the sense of being, as it seems to the believer, practical)—in effect it seems to say "life is too short to fool about with argument, you must dive in and become committed" to something. Sartre who calls himself an "atheist existentialist" is apparently committed to the belief that "hell is other people," but for most critics the main

argument against existentialist philosophy is that it often rests on a highly specialised personal experience and, as such, is incommunicable.

Existential psychology, a new if rather diffuse movement in modern psychology with no specific founder but with a number of figures who have, perhaps against their will, acquired leader status. One of the key figures is the British psychiatrist, R. D. Laing, whose radical views on psychotherapy are counted as being heretical by the vast majority of his medical colleagues. Laing holds that many so-called neurotic and psychotic conditions are essentially not "abnormal" and merely represent extreme strategies by which an individual may adjust to environmental and personal stress. Instead of attempting to suppress or eliminate the psychosis in the traditional manner, one should lead the patient through it thus allowing the individual's "unconscious plan" for his own adjustment to be fulfilled. Laing has acquired a significant following for his revolutionary views, but their penetration into orthodox psychological theory and treatment has so far been small.

Exorcism, the removal or ejection of an evil spirit by a ritual or prayer. It is easy to forget that the concept of insanity as representing a disorder of the brain, analogous to physical sickness of the body, is fairly recent in origin. Barely two centuries ago it was considered to be appropriate treatment to put lunatics into chains and beat them daily in the hope that the malevolent beings inhabiting them might be persuaded to depart. Tragically, many of the symptoms of severe forms of mental disorder induce such an apparent change in the personality of the individual as to suggest that an alien individual has indeed taken over their body, and this belief is still common in many parts of the world. Most religious systems have developed some ritual or set of rituals for expelling these demons, and while, not surprisingly, the practice of exorcism by the clergy has declined dramatically in the past century, it is still brought into play now and again in such circumstances as alleged hauntings, poltergeist phenomena, etc. From a scientific point of view, exorcism must be counted as a superstitious rite, but its suggestive power in cases of hysteria, and perhaps even more serious mental illnesses, cannot be completely ruled out. General interest in the topic has been stimulated in part by the resurgence of the practice of Black Magic and witchcraft, largely in the form of experimental dabbling by young people, who no doubt become disillusioned when it fails to live up to its promise. A sensational and terrifying novel, *The Exorcist*, which its author claims is based on fact, in early 1972 became the number one best seller in the United States, which is perhaps a fair gauge of the interest in this odd remnant of a superstitious past.

Extra-sensory Perception. *See* **Telepathy.**

F

Fabian Society. In 1848 (the year of *The Communist Manifesto* by Marx and Engels) Europe was in revolt. In most countries the workers and intellectuals started bloody revolutions against the feudal ruling classes which were no less violently suppressed; hence on the continent socialism took on a Marxist tinge which to some extent it still retains. But at the same time England was undergoing a slow but non-violent transition in her political and industrial life which led the workers in general to look forward to progress through evolution. Marxism never became an important movement in England even though it took its origin here. There were many reasons for this: the agitation of the Chartists (*q.v.*); the writings of Mill, Ruskin, and Carlyle; the reforms of Robert Owen; the religious movement led by the Wesleys; the Co-operative societies; the Christian socialists. Furthermore legislation stimulated by these bodies had led to an extension of the franchise to include a considerable number of wage-earners, remedial measures to correct some of the worst abuses of the factory system, recognition of the trade unions, etc.

This was the background against which the Fabian Society was founded in 1884 with the conviction that social change could be brought about by gradual parliamentary means. (The name is derived from Quintus Fabius Maximus, the Roman general nicknamed "Cunctator," the delayer, who achieved his successes in defending Rome against Hannibal by refusing to give direct battle.) It was a movement of brilliant intellectuals, chief among whom were Sidney and Beatrice Webb, H. G. Wells, G. B. Shaw, Graham Wallas, Sidney Olivier, and Edward Pease. The Society itself was basically a research institution which furnished the intellectual information for social reform and supported all contributing to the gradual attainment by parliamentary means of socialism.

The Webbs's analysis of society emphasised that individualist enterprise in capitalism was a hang-over from early days and was bound to defeat itself since socialism is the inevitable accompaniment of modern industrialism; the necessary result of popular government is control of their economic system by the people themselves. Utopian schemes had been doomed to failure because they were based on the fallacy that society is static and that islands of utopias could be formed in the midst of an unchanging and antagonistic environment. On the contrary, it was pointed out, society develops: "The new becomes old, often before it is consciously regarded as new." Social reorganisation cannot usefully be hastened by violent means but only through methods consonant with this natural historical progression—gradual, peaceful, and democratic. The Fabians were convinced that men are rational enough to accept in their common interest developments which can be demonstrated as necessary; thus public opinion will come to see that socialisation of the land and industries is essential in the same way that they came to accept the already-existing acts in respect of housing, insurance, medical care, and conditions of work. Gradual "permeation" of the power groups—trade unions, political parties, managers, and enlightened employers—would speed the process.

The Society collaborated first in the formation of the Independent Labour Party and then with the more moderate Labour Party and the trade unions and Co-operative movement. But in general it disapproved of independent trade union action since change should come from the government and take political form. The class-war of Marx was rejected and so too was the idea of the exclusive role of the working class—reform must come from the enlightened co-operation of all classes—not from their opposition.

Faith Healing, the belief and practice of curing physical and mental ills by faith in some supernatural power, either allegedly latent in the individual (as with Christian Science) or drawn in some way from God. It is a characteristic of faith healing that it is supposed to be publicly demonstrable—*i.e.*, a "healer" will hold public meetings and invite sick people to come up to be cured on the platform. In the emotionally charged atmosphere which the healer generates, it is not unusual for people to show immediate and striking improvement in their illness, but the almost invariable rule is for relapses to occur within days or hours after the event. When remission is more permanent, the illness is generally hysterical in origin and will often return to the individual in some other form. Spiritualists claim that the healing in such cases is done not by "faith" but by direct intervention of the spirits of doctors, etc., who have died and passed on to another world. Perhaps the world's most famous healer at this time is the Spiritualist, Harry Edwards, who has had literally millions of letters from all parts of the world asking for the healing attention of his spirit guides. Many doctors, while remaining immensely sceptical about the origins and extent of this kind of therapy, are inclined to admit that it might have benefits when the sickness is mildly hysterical in origin. The real danger, of course, comes when patients

seek unorthodox therapy before consulting their doctors in the first place.

Falangists. The Fascist Party of Spain founded in 1933 by José Antonio Primo de Rivera, son of the man who was dictator of the country from 1923 to 1930; he was shot by the Republicans. In 1937 the falangists who had shown unwelcome signs of social radicalism were merged with the other right-wing political groups to form the *Falange Española Tradicionalista y de las Juntas de Ofensive Nacional Sindicalistas* which replaced the Cortes (*i.e.* the Government) between 1939 and 1942 when the Cortes was reinstituted. The Falange is the only political party allowed in Spain. *See* **Fascism.**

Fascism. From the end of mediaeval times with the opening up of the world, the liberation of the mind and the release of business enterprise, a new spirit arose in Europe exemplified in such movements as the Renaissance, the Reformation, the struggle for democracy, the rise of capitalism, and the Industrial Revolution. With these movements there developed a certain tradition which, in spite of hindrances and disagreements or failures, was universally held both by right- and left-wing parties however strongly they might fail to agree on the best means of attaining what was felt to be a universal ideal. The hard core of this tradition involved: belief in reason and the possibility of human progress; the essential sanctity and dignity of human life; tolerance of widely different religious and political views; reliance on popular government and the responsibility of the rulers to the ruled; freedom of thought and criticism; the necessity of universal education; impartial justice and the rule of law; the desirability of universal peace. Fascism was the negation of every aspect of this tradition and took pride in being so. Emotion took the place of reason, the "immutable, beneficial, and fruitful inequality of classes" and the right of a self-constituted élite to rule them replaced universal suffrage because absolute authority "quick, sure, unanimous" led to action rather than talk. Contrary opinions are not allowed and justice is in the service of the state; war is desirable to advance the power of the state; and racial inequality made a dogma. Those who belong to the "wrong" religion, political party, or race are outside the law.

The attacks on liberalism and exaltation of the state derive largely from Hegel and his German followers; the mystical irrationalism from such 19th cent. philosophers as Schopenhauer, Nietzsche, and Bergson; from Sorel (*see* **Syndicalism**) came the idea of the "myth," and an image which would have the power to arouse the emotions of the masses and from Sorel also the rationale of violence and justification of force. But these philosophical justifications of fascism do not explain why it arose at all and why it arose where it did—in Italy, Germany, and Spain. These countries had one thing in common—disillusionment. Germany had lost the 1914–18 war, Italy had been on the winning side but was resentful about her small gains, Spain had sunk to the level of a third-rate power, and people were becoming increasingly restive under the reactionary powers of the Catholic Church, the landed aristocracy, and the army. In Marxist theory, fascism is the last fling of the ruling class and the bourgeoisie in their attempt to hold down the workers.

Italian Fascism. The corporate state set up by Benito Mussolini in Italy claimed to be neither capitalist nor socialist, and after its inception in 1922 the Fascist Party became the only recognised one. Its members wore black shirts, were organised in military formations, used the Roman greeting of the outstretched arm, and adopted as their slogan "Mussolini is always right." Membership of the Party was not allowed to exceed a number thought to be suited to the optimum size of a governing class and new candidates were drawn, after strict examinations, from the youth organisations. The Blackshirts, a fascist militia, existed separately from the army and were ruled by Fascist Headquarters.

At the head of government was Mussolini, "Il Duce" himself, a cabinet of fourteen ministers selected by him and approved by the King to supervise the various functions of government, and the Grand Council or directorate of the Fascist Party, all the members of which were chosen by the Duce. Parliament, which was not allowed to initiate legislation but only to approve decrees from above, consisted of a Senate with life-membership and a Chamber of Fasci and Corporations composed of nominated members of the Party, the National Council of Corporations, and selected representatives of the employers' and employees' confederations. Private enterprise was encouraged and protected but rigidly controlled; strikes were forbidden, but a Charter of Labour enforced the collaboration of workers and employers whose disputes were settled in labour courts presided over by the Party. All decisions relating to industry were government-controlled (*e.g.*, wages, prices, conditions of employment and dismissal, the expansion or limitation of production), and some industries such as mining, shipping, and armaments were largely state-owned.

Italian fascism served as a model in other countries, notably for the German National Socialist Party, in Spain and Japan, and most European nations between the wars had their small Fascist parties, the British version led by Sir Oswald Mosley being known as the British Union which relied on marches and violence. The Public Order Act of 1936 (*see* **Sec. D**) was passed to deal with it. Although fascism in all countries has certain recognisable characteristics, it would be wrong to think of it as an international movement taking fixed forms and with a clearly thought-out rationale as in the case of communism. It is doubtful, for example, whether Japanese "fascism" was entitled to be described as such, and the Spanish Falange differs in many respects both in outlook and origins from the German or Italian varieties. In fact the word "fascist," like "bolshevik," is often used as a purely emotive term of abuse. *See* **Falange, Nazism.**

Fatalism. *See* **Determinism.**

Feedback Cult is the name given to a curious fad which began in America in 1970 and which is interesting because it incorporates complicated scientific equipment and experimental psychological methods into its practice. The basis of the cult is as follows: for nearly fifty years it has been known that the brain is the source of varied electrical signals of very low power which can be detected by attaching electrodes to the scalp and amplifying the pulses emitted. Much scientific controversy has surrounded these pulses, and their interpretation by skilled clinicians can lead to the detection of hidden cerebral disorders such as tumours, epileptic foci, etc. The presence of one particular rhythm the so-called alpha wave, which beats at 14 cycles per second—is believed to be dependent upon whether or not the individual is "attending" to something, particularly in the visual field. It is this alpha rhythm, or rather its control, that is the basis of the feedback cult.

Within the past decade it has been discovered that when some people are connected to an electroencephalograph (the device which records brain rhythms) and are shown the recorded tracings of their own brain waves as they actually occur, they find it possible to modify and control the nature of the waves—the alpha in particular. This, a scientific curiosity rather than a major discovery, soon caught the attention of followers of yoga and other systems seeking enhanced relaxation, "mental discipline," etc. The argument was advanced that for centuries man had been seeking to exercise control over his own mental activities, without however having much opportunity to assess his success—or lack of it. The use of the EEG with the individual's brain waves "fed back" to him for inspection would remedy this. The result has been a sudden surge of lay interest in electroencephalography and a boom in the sale of small, portable EEG machines. Followers of the cult, who may sit for hours inspecting the output from their own brains and attempting to modify it at will, claim that the activity promotes mental "relaxation" and a greater and deeper understanding of their own personal problems. It is probably hardly

necessary to say that psychologists are extremely dubious about the reality of this as mental therapy, and the feedback cult will probably die away as soon as some new and equally attractive scientific toy is developed.

Fetichism, originally a practice of the natives of West Africa and elsewhere of attributing magical properties to an object which was used as an amulet, for putting spells on others, or regarded as possessing dangerous powers. In psychology the term refers to a sexual perversion in which objects such as shoes, brassières, hair, etc., arouse sexual excitement.

Feudalism. The feudal system took its origins from Saxon times and broadly speaking lasted until the end of the 13th cent. It was a military and political organisation based on land tenure, for, of course, society throughout this period was based almost entirely on agriculture. The activities of men divided them into three classes or estates. The First Estate was the clergy, responsible for man's spiritual needs; the Second was the nobility, including kings and emperor as well as the lesser nobles; the Third was composed of all those who had to do with the economic and mainly agricultural life of Europe. The praying men, the fighting men and administrators, and the toilers were all held to be dependent on each other in a web of mutual responsibilities.

The theory of feudalism, although it by no means always worked out in practice, was as follows: the earth was God's and therefore no man owned land in the modern sense of the word. God had given the pope spiritual charge of men, and secular power over them to the emperor from whom kings held their kingdoms, and in turn the dukes and counts received the land over which they held sway from the king. Members of the Second Estate held their lands on the condition of fulfilling certain obligations to their overlord and to the people living under them, so when a noble received a fief or piece of land he became the vassal of the man who bestowed it. To him he owed military service for a specified period of the year, attendance at court, and giving his lord counsel. He undertook to ransom his lord when he fell into enemy hands and to contribute to his daughter's dowry and at the knighting of his son. In return the lord offered his vassal protection and justice, received the vassal's sons into his household and educated them for knighthood.

The system was complicated by the fact that large fiefs might be subdivided and abbots often governed church lands held in fief from nobles. The serf or toiling man dwelt on the land of a feudal noble or churchman where he rendered service by tilling the soil or carrying out his craft for his manorial lord in return for protection, justice, and the security of his life and land. He was given a share in the common lands or pastures from which he provided for his own needs. In the modern sense he was not free (although at a later stage he could buy his freedom) since he was attached to the soil and could not leave without the lord's permission. On the other hand he could neither be deprived of his land nor lose his livelihood. Feudal tenures were abolished in England by statute in 1660, although they had for long been inoperative. In Japan a feudal system existed up to 1871, in Russia until 1917, and many relics of it still linger on (*e.g.* the *mezzadria* system of land tenure in parts of Italy).

Flying Saucers. In June 1947 an American private pilot, Kenneth Arnold, saw a series of wingless objects flying through the air at a speed which he estimated at thousands of miles an hour. He later told the press that the objects "flew as a saucer would if you skipped it across the water," and the phrase "flying saucers" was erroneously born. What Arnold actually saw has never been satisfactorily explained—it was probably a flight of jet fighters reflecting the sun's rays in a way that made them appear as discs—but since that date literally hundreds of thousands of people all over the world have reported the sighting of strange objects in the sky, coming in a bewildering range of shapes and sizes. Initially the American Air Force launched an official enquiry—Project Bluebook—to attempt to solve the mystery of these "unidentified flying objects" or "U.F.O.s," which finally folded in 1969 after concluding that the bulk of the sightings were probably misinterpretations of natural phenomena and that there was no evidence for the commonly held view that earth was being visited by spacecraft from some other planetary system. A rather similar conclusion was arrived at by the famous University of Colorado project—the Condon Committee—which published its findings in 1968. Despite this clear-cut official attitude, belief in the existence of flying saucers and their origin as alien space vehicles is exceedingly widespread and is held very strongly by people in all walks of life. In 1959 this striking social phenomenon attracted the attention of the psychologist C. G. Jung. He noticed that the press were inclined to report statements that saucers existed when made by prominent people and not publish contrary statements made by equally prominent people. He concluded that flying saucers were in some way welcome phenomena and in his brilliant little book, *Flying Saucers—a modern myth*, he hypothesised that the U.F.O.s were the modern equivalent of "signs in the skies." It was Jung's contention that the saucers were looked upon as the harbingers of advanced alien civilisations who had come to save the world from its descent into nuclear catastrophe—archangels in modern dress in fact.

Whatever the validity of this imaginative view of U.F.O.s, it is undeniably true that they exercise a great fascination for millions of people, some of whom invest them with definite religious significance. The best example of the open incorporation of flying saucers into a religious belief system is to be found in the Aetherius Society, an international organisation with headquarters in Los Angeles but founded by a former London clerk, George King. Mr. King, who claims to be the mediumistic link between earth and the largely benevolent beings from outer space, regularly relays messages—notably from a Venusian known as Aetherius—to enthusiastic congregations at religious meetings. The sect, which is entirely sincere and dedicated in its beliefs, also makes pilgrimages to the tops of various mountains which have been "spiritually charged" with the aid of the spacebeings in their flying saucers.

Odd though such ideas may seem to most people, they can be readily understood within the context of the very marked decline in orthodox religious belief which we have seen in the past two decades. To an increasing number of people, many of whom feel a desperate need for spiritual guidance and enlightenment, the concepts of the traditionally Western religions seem somehow unsatisfactory. Many therefore turn to cults and splinter groups which use ideas and terminology which to them seem more at home in the twentieth century than those that sprung to life thousands of years ago. To members of the Aetherius Society, for example, the idea that Jesus Christ lives on Venus and rides around in a flying saucer is neither blasphemous nor ludicrous. As long as empty churches testify to the growing, if perhaps only temporary loss of contact between orthodox religions and the man-in-the-street, then one can expect such offbeat ideas as the cults surrounding flying saucers, and the science-fiction-like cult of Scientology (*q.v.*) to expand and flourish.

Fourierism. *See* Utopianism.

Freemasonry, a widespread, influential secret organisation of English origin. Although it can be traced back to the Middle Ages when itinerant working masons in England and Scotland were organised in lodges with secret signs for the recognition of fellow-members, modern freemasonry first arose in England in the early decades of the 18th cent. The first Grand Lodge was founded in London in 1716 and Freemasons' Hall was opened in 1776. With its clubs for discussion and social enjoyment (women were excluded) it met a need and became a well-known feature of English life. The movement quickly spread abroad to places which had direct trade links with England. The graded lodge structure, the social prestige conferred by membership, the symbolism, ritual and ceremony, and the emphasis on mutual

help have had a lasting appeal. Interest in the occult had more appeal on the continent than in England. Until a decade or so ago, membership conferred definite business and social advantages, particularly in small communities where the leading middle-class figures were generally members. Recently this advantage has markedly declined and freemason lodges nowadays tend to be little more than worthy charitable organisations. Fear of secret societies has given freemasonry many opponents; it was condemned by the Roman Catholic Church, banned by Fascist dictators, and denounced by the Comintern. The fact that the movement's influence on religious and economic matters is slowly waning may be evidenced by the recent rumours that the Roman Catholic Church was expecting to lift its ban on Freemasonry.

Freudian theory. *See* Psychoanalysis.

Friends, The Society of. *See* Quakers.

Fundamentalism is a term covering a number of religious movements which adhere with the utmost rigidity to orthodox tenets; for example the Old Testament statement that the earth was created by God in six days and six nights would be held to be factual rather than allegorical or symbolic. There is a strong minority undercurrent of support for various Fundamental religions, including such sects as Jehovah's Witnesses, the Seventh Day Adventists, etc. Although the holding of rigid beliefs in the literal truth of the Bible might seem to be frequently contrary to modern scientific findings, the fundamentalists at least do not have the problems of compromise and interpretation to face, and among many simple-minded and poorly educated people this is no doubt a great attraction.

G

Game Theory, an approach to understanding human and animal behaviour which takes the view that psychological insight is best gained by studying the decisions which all living things make constantly and which govern the course of their lives. It proposes that life is basically a strategic game following complex rules which can probably only be understood by a study of the "decision units" as and when they occur. Because one is dealing with highly variable animals controlled by highly complex brains, and not with simple clockwork or electro-mechanical systems, the study of the rules which operate in the game of life is enormously complicated and thus game theory has quickly taken off into advanced mathematics. Game theory, incidentally, can be used to apply to individual action or to the behaviour of groups. Little of any predictive value has been put forward by the protagonists of this approach, but the use of computers to tackle the complex mathematics involved may well lead to some interesting advances.

Gestalt Psychology. In the latter half of the 19th cent. it became evident to psychologists that in principle there was no good reason why "mental" events should not be just as measurable and manageable as "physical" ones. Intensive studies of learning, memory, perception, and so on were therefore undertaken and the beginnings of an empirical science of psychology were underway. In the early part of the 20th cent. the experiments of Pavlov (*see* Behaviourism) and his co-workers suggested that the behaviour of an animal, or even men, might ultimately be reduced to a descriptive account of the activities of nervous reflex loops—the so-called conditioned reflexes. With the publication of Watson's important book on Behaviourism in 1914 it looked as though the transfer of psychological studies from the field of philosophy to that of science could now take place. Actually the over-simplified picture of cerebral and mental pictures which Behaviourism offered was rather comparable to the billiard ball view of the universe so fashionable in Victorian science. Just as Behaviourism implied that there was a fundamental building block (the conditioned reflex) from which all mental events could be constructed, so Victorian physics assumed that the entire universe could be described in terms of a vast collection of atoms pushing each other around like billiard balls. The development of nuclear physics was to shatter the latter dream and at the same time a challenge to the naïve "reflex psychology" came from the Gestalt experimental school.

The founders of this school were Max Wertheimer, Kurt Koffka and Wolfgang Kohler, three young psychologists who in 1912 were conducting experiments—notably in vision—which seemed to expose the inadequacies of the behaviourist position. The Pavlov–Watson view, as we have said, implied that complex sensory events were no more than a numerical sum of individual nervous impulses. Wertheimer's group proposed that certain facts of perceptual experiences (ruled out of court as subjective and therefore unreliable by Watson) implied that *the whole (Gestalt) was something more than simply the sum of its parts.* For example, the presentation of a number of photographs, each slightly different, in rapid series gives rise to cinematographic motion. In basic terms, the eye has received a number of discrete, "still" photographs, and yet "motion" is perceived. What, they asked, was the sensory input corresponding to this motion? Some processes within the brain clearly *added* something to the total input as defined in behaviourist terms. An obvious alternative—in a different sense modality—is that of the arrangement of musical notes. A cluster of notes played one way might be called a tune; played backwards they may form another tune, or may be meaningless. Yet in all cases the constituent parts are the same, and yet their relationship to one another is evidently vital. Once again the whole is something more than the simple sum of the parts.

The implications of all this appeared to be that the brain was equipped with the capacity to organise sensory input in certain well-defined ways, and that far from being misleading and scientifically unjustifiable, human subjective studies of visual experience might reveal the very principles of organisation which the brain employs. Take a field of dots, more or less randomly distributed; inspection of the field will soon reveal certain patterns or clusters standing out—the constellations in the night sky are a good illustration. There are many other examples, and Wertheimer and his colleagues in a famous series of experiments made some effort to catalogue them and reduce them to a finite number of "Laws of Perceptual Organisation" which are still much quoted today. *See* Q19, Q21.

Ghosts, belief in ghosts is one of the most common features of supernatural and mystical philosophy. At its roots it is based on the assumption that Man is essentially an individual created of two separate and distinct substances, mind and body. Most religious systems hold to this dualistic view (*see* Dualism), arguing that whereas the body is transient and destructible, the mind or spirit is permanent and survives the death of its physical host. The discarnate spirit is normally assumed to progress to some other realm ("Heaven," "Nirvana," "The Spirit World," etc.) whereupon it loses contact with the mortal world. Occasionally, however, for one reason or another, the spirits may not progress and may become trapped and unable to escape the material world. Traditionally this is supposed to occur when the death of the individual is precipitated by some great tragedy —murder, suicide, etc.—when the site of the tragedy is supposed to be haunted by the earthbound spirit. Although the library of the Society for Psychical Research is crammed with supposedly authentic accounts of hauntings of this kind, scientific interest in ghosts has been waning rapidly in recent years. At one time, in particular in the latter part of the 19th cent., with the upsurge of scientific interest in Spiritualism (*q.v.*), there were even attempts to call up ghosts in the laboratory. These led to spectacular opportunities for fraud on the part of Spiritualist mediums and the like, but in the long run added little to the cause of science. As we have said, belief in ghosts is largely

dependent upon a parallel belief that the mind or soul of man is something essentially separate from the body. With the decline in belief of this notion (it is now almost totally dismissed by most scientists and philosophers) has come an inevitable decline in belief in ghosts.

Gnosticism. Among the many heresies of early Christianity, especially during its first two centuries, was a group which came under the heading of Gnosticism. This was a system or set of systems which attempted to combine Christian beliefs with others derived from Oriental and Greek sources, especially those which were of a mystical and metaphysical nature, such as the doctrines of Plato and Pythagoras. There were many Gnostic sects, the most celebrated being the Alexandrian school of Valentius (fl. *c.* 136–*c.* 160). "Gnosis" was understood not as meaning "knowledge" or "understanding" as we understand these words, but "revelation." As in other mystical religions, the ultimate object was individual salvation; sacraments took the most varied forms. Many who professed themselves Christians accepted Gnostic doctrines and even orthodox Christianity contains some elements of Gnostic mysticism. It was left to the bishops and theologians to decide at what point Gnosticism ceased to be orthodox and a difficult task this proved to be. Two of the greatest, Clement of Alexandria and his pupil Origen, unwittingly slipped into heresy when they tried to show that such men as Socrates and Plato, who were in quest of truth, were Christian in intention, and by their lives and works had prepared the way for Christ. Thus they contradicted Church doctrine which specifically said *Extra ecclesiam nulla salus*—outside the Church there is no salvation.

God and Man. The idea of gods came before the idea of God and even earlier in the evolution of religious thought there existed belief in spirits (*see* **Animism**). It was only as a result of a long period of development that the notion of a universal "God" arose, a development particularly well documented in the Old Testament. Here we are concerned only with the views of philosophers, the views of specific religious bodies being given under the appropriate headings. First, however, some definitions.

Atheism is the positive disbelief in the existence of a God. **Agnosticism** (a term coined by T. H. Huxley, the 19th cent. biologist and contemporary of Darwin) signifies that one cannot know whether God exists or not. **Deism** is the acceptance of the existence of God, not through revelation, but as a hypothesis required by reason. **Theism** also accepts the existence of God, but, unlike Deism, does not reject the evidence of revelation (*e.g.*, in the Bible or in the lives of the saints). **Pantheism** is the identification of God with all that exists (*i.e.*, with the whole universe). **Monotheism** is the belief in one God, **Polytheism** the belief in many (*see also* **Dualism**).

Early Greek Views. Among the early Greek philosophers, Thales (*c.* 624–565 B.C.) of Miletus, in Asia Minor, Anaximander (611–547 B.C.), his pupil, and Anaximenes (b. *c.* 570 B.C.), another Miletan, were men of scientific curiosity and their speculations about the origin of the universe were untouched by religious thought. They founded the scientific tradition of critical discussion. Heraclitus of Ephesus (*c.* 540–475 B.C.), was concerned with the problem of change. How does a thing change and yet remain itself? For him all things are flames—processes. "Everything is in flux, and nothing is at rest." Empedocles of Agrigentum in Sicily (*c.* 500–*c.* 430 B.C.) introduced the idea of opposition and affinity. All matter is composed of the so-called four elements—*earth*, *water*, *air*, and *fire*—which are in opposition or alliance with each other. All these were materialist philosophers who sought to explain the working of the universe without recourse to the gods.

Socrates, Plato, and Aristotle. Socrates (470–399 B.C.) was primarily concerned with ethical matters and conduct rather than the nature of the universe. For him goodness and virtue come from knowledge. He obeyed an "inner voice" and suffered death rather than give up his philosophy. He believed in the persistence of life after death and was essentially a monotheist. Plato (427–347 B.C.) was chiefly concerned with the nature of reality and thought in terms of absolute truths which were unchanging, logical, and mathematical. (*See* **Mind and Matter.**) Aristotle (384–322 B.C.) took his view of matter not from Democritus (atomic view) but from Empedocles (doctrine of four elements), a view which came to fit in well with orthodox mediaeval theology. Matter is conceived of as potentially alive and striving to attain its particular form, being moved by divine spirit or mind (*nous*). (An acorn, for example, is matter which contains the form "oak-tree" towards which it strives.) Thus there is a whole series from the simplest level of matter to the perfect living individual. But there must be a supreme source of all movement upon which the whole of Nature depends, a Being that Aristotle describes as the "Unmoved Mover," the ultimate cause of all becoming in the universe. This Being is pure intelligence, a philosopher's God, not a personal one. Unlike Plato, Aristotle did not believe in survival after death, holding that the divine, that is the immortal element in man, is mind.

Among the later Greek thinkers the Epicureans were polytheists whose gods, however, were denied supernatural powers. The Stoics built up a materialist theory of the universe, based on the Aristotelian model. To them God was an all-pervading force, related to the world as the soul is related to the body, but they conceived of it as material. They developed the mystical side of Plato's idealism and were much attracted by the astrology coming from Babylonia. They were pantheists. The Sceptics were agnostics.

From Pagan to Christian Thought. Philo, "the Jew of Alexandria," who was about 20 years older than Jesus, tried to show that the Jewish scriptures were in line with the best in Greek thought. He introduced the *Logos* as a bridge between the two systems. Philo's God is remote from the world, above and beyond all thought and being, and as His perfection does not permit direct contact with matter the divine *Logos* acts as intermediary between God and man. Plotinus (204–70), a Roman, and the founder of Neoplatonism, was the last of the great pagan philosophers. Like Philo, he believed that God had created the world indirectly through emanations—beings coming from Him but not of Him. The world needs God but God does not need the world. Creation is a fall from God, especially the human soul when enmeshed in the body and the world of the senses, yet (*see* **Determinism**) man has the ability to free himself from sense domination and turn towards God. Neoplatonism was the final stage of Greek thought drawing its inspiration from the mystical side of Plato's idealism and its ethics from Stoicism.

Christianity: The Fathers and the Schoolmen. It was mainly through St. Augustine (354–430), Bishop of Hippo in North Africa, that certain of the doctrines of Neoplatonism found their way into Christianity. Augustine also emphasised the concept of God as all good, all wise, all knowing, transcendent, the Creator of the universe out of nothing. But, he added, since God knows everything, everything is determined by Him forever. This is the doctrine of predestination and its subsequent history is discussed under **Determinism.**

In the early centuries of Christianity, as we have seen, some found it difficult to reconcile God's perfection with His creation of the universe and introduced the concept of the *Logos* which many identified with Christ. Further, it came to be held that a power of divine origin permeated the universe, namely the Holy Spirit or Holy Ghost. Some theory had to be worked out to explain the relationships of these three entities whence arose the conception of the Trinity. God is One; but He is also Three: Father, Son (the *Logos* or Christ), and Holy Ghost.

This doctrine was argued by the Apologists and the Modalists. The former maintained that the *Logos* and the Holy Spirit were emanations from God and that Jesus was the *Logos*

in the form of a man. The Modalists held that all three Persons of the Trinity were God in three forms or modes: the *Logos* is God creating, the Holy Spirit God reasoning, and God is God being. This led to a long discussion as to whether the *Logos* was an emanation from God or God in another form; was the *Logos* of like *nature* with God or of the same *substance*? This was resolved at the Council of Nicaea (325) when Athanasius formulated the orthodox doctrine against Arius (*q.v.*): that the one Godhead is a Trinity of the same substance, three Persons of the same nature—Father, Son, and Holy Ghost.

St. Thomas Aquinas (1227–74), influenced greatly by Aristotle's doctrines, set the pattern for all subsequent Catholic belief even to the present time. He produced rational arguments for God's existence: *e.g.*, Aristotle's argument that, since movement exists, there must be a prime mover, the Unmoved Mover or God; further, we can see that things in the universe are related in a scale from the less to the more complex, from the less to the more perfect, and this leads us to suppose that at the peak there must be a Being with absolute perfection. God is the first and final cause of the universe, absolutely perfect, the Creator of everything out of nothing. He reveals Himself in his Creation and rules the universe through His perfect will. How Aquinas dealt with the problem of predestination is told under Determinism.

Break with Mediaeval Thought. Renaissance thinkers, free to think for themselves, doubted the validity of the arguments of the Schoolmen but most were unwilling to give up the idea of God (nor would it have been safe to do so). Mystics (*see* Mysticism) or near-mystics such as Nicholas of Cusa (*c.* 1401–64) and Jacob Boehme (1575–1624) taught that God was not to be found by reason but was a fact of the immediate intuition of the mystical experience. Giordano Bruno held that God was immanent in the infinite universe. He is the unity of all opposites, a unity without opposites, which the human mind cannot grasp. Bruno was burned at the stake in 1600 at the instigation of the Inquisition (a body which, so we are told, never caused pain to anyone since it was the civil power, not the Inquisition, that carried out the unpleasant sentences) for his heresy.

Francis Bacon, who died in 1626, separated, as was the tendency of that time, science from religion. The latter he divided into the two categories of natural and revealed theology. The former, through the study of nature, may give convincing proof of the existence of a God but nothing more. Of revealed theology he said: "we must quit the small vessel of human reason . . . as we are obliged to obey the divine law, though our will murmurs against it, so we are obliged to believe in the word of God, though our reason is shocked at it." Hobbes (d. 1679) was a complete materialist and one feels that obeisance to the notion was politic rather than from conviction. However, he does mention God as starting the universe; in motion infers that God is corporeal but denies that His nature can be known.

From Descartes Onwards. Descartes (1596–1650) separated mind and body as different entities but believed that the existence of God could be deduced by the fact that the idea of him existed in the mind. Whatever God puts into man, including his ideas, must be real. God is self-caused, omniscient, omnipotent, eternal, all goodness and truth. But Descartes neglected to explain how mind separate from body can influence body, or God separate from the world can influence matter.

Spinoza (1632–77) declared that all existence is embraced in one substance—God, the all-in-all. He was a pantheist and as such was rejected by his Jewish brethren. But Spinoza's God has neither personality nor consciousness, intelligence nor purpose, although all things follow in strict law from His nature. All the thought of everyone in the world, make up God's thoughts.

Bishop Berkeley (1685–1753) took the view that things exist only when they are perceived, and this naturally implies that a tree, for example, ceases to exist when nobody is looking at it. This problem was solved to his own satisfaction by assuming that God, seeing everything, prevented objects from disappearing when we were not present. The world is a creation of God but it is a spiritual or mental world, not a material one.

Hume (1711–76), who was a sceptic, held that human reason cannot demonstrate the existence of God and all past arguments to show that it could were fallacious. Yet we must believe in God since the basis of all hope, morality, and society is based upon the belief. Kant (1724–1804) held a theory similar to that of Hume. We cannot know by reason that God exists, nor can we prove on the basis of argument anything about God. But we can form an idea of the whole of the universe, the one Absolute Whole, and personify it. We need the idea of God on which to base our moral life, although this idea of God is transcendent, *i.e.*, goes beyond experience.

William James (1842–1910), the American philosopher (*see* Pragmatism), held much the same view: God cannot be proved to exist, but we have a will to believe which must be satisfied, and the idea works in practice. Hegel (1770–1831) thought of God as a developing process, beginning with "the Absolute" or First Cause and finding its highest expression in man's mind, or reason. It is in man that God most clearly becomes aware of Himself. Finally Comte (1798–1857), the positivist, held that religion belongs to a more primitive state of society and, like many modern philosophers, turned the problem over to believers as being none of the business of science.

Golden Dawn, Order of, a strange but intellectually influential secret society founded in 1887 by three former Rosicrucians (*q.v.*). The Society, which was but one of the large number of occult organisations which flourished in the latter half of the 19th cent., was particularly interesting because it attracted so many scholarly eccentrics to its ranks. These included the poet W. B. Yeats, the actress Florence Farr, the writers Arthur Machen and Algernon Blackwood and the poetess Dion Fortune. A member with a less savoury reputation was the notorious Aleister Crowley who was ultimately expelled from the order for practising Black Magic. Essentially the movement, like others of its kind, professed to offer important secrets of occult knowledge, and taught its followers the basic principles of White, as opposed to Black Magic. Mainly harmless in their aims and activities, societies such as this served largely as pastimes for individuals of intellectual and academic standing who found the concepts and rituals of the Established Church too dull for their inquisitive minds. Most members of the Order of the Golden Dawn either became disillusioned when the white magic, which they had so arduously studied, failed to provide any genuine supernatural results and gave up in disgust, or broke away to form their own rival groups. Though these often had equally glamorous names and rituals, they tended to be no more successful and themselves vanished into the mists of obscurity. Today so-called White Magic has become fashionable with many young people, no doubt as the result of the almost total collapse of the authority of orthodox religion, but it is noticeable that such interest is generally to be found among the less well-educated and intelligent. White Magic had its intellectual heyday in the 19th cent. and it is unlikely ever to attract such sustained academic interest again.

Good and Evil.

Early Philosophers' Views. The early Greek philosophers were chiefly concerned with the laws of the universe, consequently it was common belief that knowledge of these laws, and living according to them, constituted the supreme good. Heraclitus, for example, who taught that all things carried with them their opposites, held that good and evil were like two notes in a harmony, necessary to each other. "It is the opposite which is good for us." Democritus, like Epicurus (*q.v.*), held that the main goal of life is happiness, but happiness in moderation. The good man is not merely the one who *does* good but who always

wants to do so: "You can tell the good man not by his deeds alone but by his desires." Such goodness brings happiness, the ultimate goal. On the other hand, many of the wandering Sophist teachers taught that good was merely social convention, that there are no absolute principles of right and wrong, that each man should live according to his desires and make his own moral code. To Socrates knowledge was the highest good because doing wrong is the result of ignorance: "no man is voluntarily bad." Plato and Aristotle, differing in many other respects, drew attention to the fact that man is composed of three parts: his desires and appetites, his will, and his reason. A man whose reason rules his will and appetites is not only a good but a happy man; for happiness is not an aim in itself but a by-product of the good life. Aristotle, however, emphasised the goal of self-realisation, and thought that if the goal of life is (as Plato had said) a rational attitude towards the feelings and desires, it needs to be further defined. Aristotle defined it as the "Golden Mean"—the good man is one who does not go to extremes but balances one extreme against another. Thus courage is a mean between cowardice and foolhardiness. The later philosophers Philo and Plotinus held that evil was in the very nature of the body and its senses. Goodness could only be achieved by giving up the life of the senses and, freed from the domination of the body, turning to God, the source of goodness.

Christian Views. St. Augustine taught that everything in the universe is good. Even those things which appear evil are good in that they fit with the harmony of the universe like shadows in a painting. Man should turn his back on the pleasures of the world and turn to the love of God. Peter Abelard (1079–1142) made the more sophisticated distinction when he suggested that the wrongness of an act lies not in the act itself, but in the intention of the doer: "God considers not what is done but in what spirit it is done; and the merit or praise of the agent lies not in the deed but in the intention." If we do what we believe to be right, we may err, but we do not sin. The only sinful man is he who deliberately sets out to do what he knows to be wrong. St. Thomas Aquinas agreed with Aristotle in that he believed the highest good to be realisation of self as God has ordained, and he also agreed with Abelard that intention is important. Even a good act is not good unless the doer intended it to have good consequences. Intention will not make a bad act good, but it is the only thing that will make a good act genuinely good.

In general, Christianity has had difficulties in solving the problem of the existence of evil; for even when one accepts that the evil men do is somehow tied up with the body, it is still difficult to answer the question: how could an all-good God create evil? This is answered in one of two ways: (*a*) that Adam was given free-will and chose to sin (an answer which still does not explain how sin could exist anywhere in the universe of a God who created everything); (*b*) by denying the reality of evil as some Christians have chosen to do (*e.g.*, Christian Science *q.v.*). The Eastern religions, on the other hand (*see* Zoroastrianism), solved the problem in a more realistic way by a dualism which denied that their gods were the creators of the whole universe and allowed the existence of at least two gods, one good and one evil. In Christianity there is, of course, a Devil, but it is not explained whence his evil nature came.

Later Philosophic Views. Hobbes equated good with pleasure, evil with pain. They are relative to the individual man in the sense that "one man's meat is another man's poison." Descartes believed that the power to distinguish between good and evil given by God to man is not complete, so that man does evil through ignorance. We act with insufficient knowledge and on inadequate evidence. Locke, believing that at birth the mind is a blank slate, held that men get their opinions of right and wrong from their parents. By and large, happiness is good and pain is evil. But men do not always agree over what is pleasurable and what not. Hence laws exist and these fall into three categories: (1) the divine law; (2) civil laws; (3) matters of opinion or reputation which are enforced by the fact that men do not like to incur the disapproval of their friends. We learn by experience that evil brings pain and good acts bring pleasure, and, basically, one is good because not to be so would bring discomfort.

Kant (*see* God and Man) found moral beliefs to be inherent in man whether or not they can be proved by reason. There is a categorical imperative which makes us realise the validity of two universal laws: (1) "always act in such a way that the maxim determining your conduct might well become a universal law; act so that you can will that everybody shall follow the principle of your action; (2) "always act so as to treat humanity, whether in thine own person or in that of another, in every case as an end and never as a means."

Schopenhauer (1788–1860) was influenced by Buddhism and saw the will as a blind impelling striving, and desire as the cause of all suffering. The remedy is to regard sympathy and pity as the basis of all morality and to deny one's individual will. This is made easier if we realise that everyone is part of the Universal Will and therefore the one against whom we are struggling is part of the same whole as ourselves.

John Stuart Mill and Jeremy Bentham were both representatives of the Utilitarian school, believing that good is the greatest good (happiness) of the greatest number (*see* Utilitarianism). Lastly, there is the view held mostly by political thinkers that good is what is good for the state or society in general (*see* State and Man).

Graphology, the study of the analysis of human handwriting. There are two approaches to this topic and it is important to separate them clearly. The first involves the attempt on the part of an expert to decide from looking at a signature (*a*) to whom it belongs, and (*b*) whether or not it is forgery. This art is a legitimate, though tricky area of study, and graphologists have been called in as expert witnesses in courts of law. The second approach involves attempts to detect such tenuous variables as character from a study of an individual's handwriting, and the facts here are altogether less clear. Psychologists find it difficult enough to assess character or personality in a face-to-face interview and even when they are equipped with a range of special tests. The general opinion here would seem to be that some slight information might be revealed by a careful study of handwriting, but that the overall effect would be too unreliable for this kind of graphology to be of practical value.

Greater World Spiritualists. Spiritualism, as an organised religion, holds the view that the human personality survives death, and that it is possible to communicate with the spirits of those who have died in the physical sense. Relatively little importance is attached to the divinity of Jesus Christ, which is of course the cornerstone of the Christian faith. Some Spiritualists, however, hold a kind of halfway house position, believing both that Jesus was the son of God, and also that communication with the spirit world is not only possible but also a "lost aspect" of Christian teachings. The most significant group holding this view are the Greater World Christian Spiritualists Association, founded in 1931. Their teachings are based on trance addresses received through the mediumship of Winifred Moyes. Despite the fact that her control in the spirit world was named "Zodiac," Christian Spiritualists claim that their philosophy is closer to the original teachings of Jesus than that of the orthodox Church today.

Guild Socialism, a British form of syndicalism (*q.v.*) created in 1906 by an architect, A. J. Penty, who was soon joined by A. R. Orage, S. G. Hobson, and G. D. H. Cole. The background to the movement was the situation that, although at that time the Labour Party had 29 members in the House of Commons, a period of severe economic crisis had shown the government unwilling and the Labourites unable to do anything about it; the workers were resorting

again to direct action to secure their demands and the democratic and constitutional methods to which the Fabians had partly persuaded them seemed to have failed. The guild socialists advocated a restoration of the mediaeval guild system as was being recommended by the French syndicalists whose programme involved a return to direct economic action, a functional industrial structure, return of craftsmanship, and distrust of the state. Guild socialists believed that value was created by society as a whole rather than by individuals singly, and that capitalist economists had recommended the acquisition of wealth without emphasising the social responsibilities which wealth should bring. The trade unions were to be organised to take over and run their own industries after nationalisation. Thus guild socialists were not only against capitalism but also against state socialism in which the state took over the control of industry. Political authority was held to be uncongenial to human freedom and therefore nothing was to be gained by the substitution of state bureaucracy for capitalist control. The National Guilds League, formed in 1915, advocated the abolition of the wages system, self-government in industry, control by a system of national guilds acting in conjunction with other functional democratic organisations in the community. This body was dissolved in 1925, but the theories of guild socialism have undoubtedly influenced British socialism.

Gurdjieff, Russian–Greek mystic who set up an occult commune near Paris in the 1930s, to which were attracted a host of the intellectual and literary avant garde of the time. His teachings, which are immensely obscure, are presented in allegorical form in a lengthy philosophical novel, *All and Everything*, which has the peculiar sub-title "Beelzebub's Tales to his Grandson." Opinions as to the merits of Gurdjieff's ideas are strikingly varied, some commentators hold that he was one of the century's leading philosophers, others that he was a brazen confidence trickster with a vivid personality and the gift of making trivial observations sound pregnant with meaning. The truth probably lies somewhere in between the two extremes and, despite the fact that a number of highly intelligent individuals still espouse his cause two decades after his death, most people continue to find his books largely unreadable and his philosophy muddled and pretentious.

H

Heresy, originally meant a sect or school of thought holding views different from others (*e.g.*, Pharisees and Sadducees within Judaism). Later it came to mean beliefs contrary to orthodox teaching (*e.g.*, Arianism, Apollinarianism, Nestorianism).

Hinduism, the religion and social institutions of the great majority of the people of India. Hinduism has no fixed scriptural canon but its doctrines are to be found in certain ancient works, notably the *Veda*, the *Brahmanas*, the *Upanishads*, and the *Bhagavad-gita*. The dark-skinned Dravidians invaded India between about 3250 and 2750 B.C. and established a civilisation in the Indus valley. They were polytheists who worshipped a number of nature-gods; some elements of their beliefs persisted into Hinduism. They were subdued by a light-skinned Nordic people who invaded from Asia Minor and Iran about 1500 B.C. The language of these Aryan people was Vedic, parent of Sanskrit in which their religious literature (the Vedas) came to be written after many centuries of oral transmission.

The *Veda* or Sacred Lore has come down to us in the form of mantras or hymns of which there are four great collections, the best-known being the *Rig-Veda*. These Vedic Aryans worshipped nature-deities, their favourites being Indra (rain), Agni (fire), and Surya (the sun). Their religion contained no idolatry but became contaminated by the more primitive beliefs of the conquered Dravidians. Sacrifice and ritual became predominant in a ceremonial religion.

As a reaction a more philosophic form arose (*c.* 500 B.C.) with its scriptures in the *Upanishads*. At its highest level, known as Brahmanism, belief is in a subtle and sophisticated form of monotheism (*Brahma* is an impersonal, all-embracing spirit), but there is a tolerant acceptance of more primitive beliefs. Thus Vishnu (a conservative principle) and Siva (a destructive principle) grew out of Vedic conceptions. The two great doctrines of Hinduism are *karma* and transmigration. The universal desire to be reunited with the absolute (the *Atman* or *Brahma*) can be satisfied by following the path of knowledge. Life is a cycle of lives (*samsara*) in which man's destiny is determined by his deeds (*karma*) from which he may seek release (*moksa*) through ascetic practices or the discipline of Yoga (*q.v.*). Failure to achieve release means reincarnation—migration to a higher or lower form of life after death—until the ultimate goal of absorption in the absolute is reached.

In the great Sanskrit epic poems *Ramayana* and *Mahabharata* the deity takes three forms, represented by the divine personalities of Brahma, Vishnu, and Siva. There are also lower gods, demi-gods, supernatural beings, and members of the trinity may even become incarnate, as Vishnu became identified with Krishna, one of the heroes of the *Mahabharata* and the well-known *Bhagavad-gita*.

The ritual and legalistic side of Brahmanism is the caste system based on the elaborate codes of the *Law of Manu*, according to which God created distinct orders of men as He created distinct species of animals and plants. Men are born to be Brahmans, soldiers, agriculturists, or servants, but since a Brahman may marry a woman from any of these castes, an endless number of sub-castes arises.

Hinduism has always shown great tolerance for varieties of belief and practice. Ideas pleasant and unpleasant have been assimilated: fetichism, demon-cults, animal-worship, sexual-cults (such as the rites of *Kali* in Calcutta). Today, as would be expected in a country which is in the throes of vast social change, Hinduism itself is changing. Under the impact of modern conditions new ideas are destroying old beliefs and customs. *See also* Jainism, Sikhism.

Holy Rollers. Contrary to general belief there is no single individual religious group calling themselves Holy Rollers; rather this is a generic term referring to a number of minor revivalist groups whose members work themselves into an ecstatic frenzy in the course of religious worship. Swooning and fainting are probably the most popular methods of expressing this kind of religious ecstasy, but "speaking with tongues" (*i.e.*, babbling nonsense), snake handling (many believers die from snake venom as a consequence) and uncontrolled dancing are also featured. Athletic religious worship of this kind is of course of great interest to psychologists. Anthropologists are equally interested, for they see in such behaviour patterns vivid reminders—if such are needed—that mankind has a history that predates our present culture by millions and not just by thousands of years.

Homoeopathy, a branch of fringe medicine whose motto *Similia Similibus Curantur* (like cures like) sums up its controversial approach to therapy. In essence the homoeopathists claim that a disease can be treated by administering quite minute doses of a substance which produce symptoms (in the healthy person) similar to those induced by the disease itself. The founder and populariser of this unusual approach to medicine was the German Samuel Hahnemann who was born in 1775, a friend of the physician Mesmer who propagated hypnotherapy. Hahnemann lived to see his ideas spread across the civilised world and despite the grave theoretical difficulties implicit in the question of how the very minute dosages actually achieve any result at all, it remained a respectable approach of medicine until the latter half of the last century. Even today a number of qualified doctors still employ homoeopathic ideas within the framework of the national health service, and the late King George V was treated by the eminent homoeopathist, Sir John Weir, but it seems nevertheless to be in slow but

steady decline. This is probably due not to any revealed deficiences in homoeopathy itself, but rather to the extraordinary advances which have been made in orthodox medicine in the last few decades.

Humanism, the term applied to (1) a system of education based on the Greek and Latin classics; and (2) the vigorous attitudes that accompanied the end of the Middle Ages and were represented at different periods by the Renaissance, the Reformation, the Industrial Revolution, and the struggle for democracy. These include: release from ecclesiastical authority, the liberation of the intellect, faith in progress, the belief that man himself can improve his own conditions without supernatural help and, indeed has a duty to do so. " Man is the measure of all things " is the keynote of humanism. The humanist has faith in man's intellectual and spiritual resources not only to bring knowledge and understanding of the world but to solve the moral problems of how to use that knowledge. That man should show respect to man irrespective of class, race or creed is fundamental to the humanist attitude to life. Among the fundamental moral principles he would count those of freedom, justice, tolerance and happiness.

Today the idea that people can live an honest, meaningful life without following a formal religious creed of some kind does not seem particularly shocking. It is an interesting gauge of the rapid change in social attitudes to religion that when, less than twenty years ago, the psychologist Margaret Knight tentatively advanced this thesis in a short B.B.C. talk, public opinion seemed to be outraged and both Mrs. Knight and the B.B.C. were openly attacked by the popular press for immoral and seditious teachings.

Hussites, the followers of John Hus, the most famous pupil of John Wyclif. He was the rector of Prague University and, although it is now by no means certain that his beliefs were heretical, he was condemned to death for heresy and burnt at the stake in 1415 at Constance whence he had come with a safe conduct issued by the Emperor Sigismund of Hungary. The latter based his action on the doctrine that no faith need be kept with heretics, but it is obvious that the main objection to Hus was his contempt for authority of any kind. After their leader's death, the Hussites became a formidable body in Bohemia and Moravia. They took up arms on behalf of their faith, their religion being strongly imbued with political feeling (hostility to Germanism and to the supremacy of the Roman Church). Their religious struggles for reform led to the Hussite Wars during which the movement splintered into several groups.

I

I Ching, the Chinese " Book of Changes " which is supposed to provide a practical demonstration of the truths of ancient Chinese philosophy. The method consists of casting forty-nine sticks into two random heaps, or more simply, of tossing three coins to see if there is a preponderance of heads or tails. The coins are cast six times whereupon the head-tail sequence achieved is referred to a coded series of phrases in the book, which are supposed to relate in some way to the question held in the mind when the sticks or coins are being cast. The phrases are without exception vague, and platitudinous remarks such as " Evil people do not further the perserverance of the superior man," etc., abound. Consequently it is not difficult to read into such amorphous stuff a suitable " interpretation " or answer to one's unspoken question. The I Ching might well be looked upon as an entertaining parlour game, but it is currently a great fad in Europe and America and is taken with great seriousness by an astonishing number of people.

Idealism, in a philosophical sense, the belief that there is no matter in the universe, that all that exists is mind or spirit. *See* Mind and Matter and Realism.

Illuminati, a secret society founded in 1776 by Adam Weishaupt, a Bavarian professor of canon law at Ingolstadt, in an attempt to combat superstition and ignorance by founding an association for rational enlightenment and the regeneration of the world. " He tried to give the social ideals of the Enlightenment realisation by conspiratorial means " (J. M. Roberts, *The Mythology of the Secret Societies*, 1972). Under conditions of secrecy it sought to penetrate and control the masonic lodges for subversive purposes. Among its members were Goethe and Schiller. The Order spread to Austria, Italy and Hungary but was condemned by the Roman Catholic Church and dissolved in 1785 by the Bavarian government.

Immortality. The belief in a life after death has been widely held since the earliest times. It has certainly not been universal, nor has it always taken a form which everyone would find satisfying. In the early stages of human history or prehistory everything contained a spirit (*see* Animism) and it is obvious from the objects left in early graves that the dead were expected to exist in some form after death. The experience of dreams, too, seemed to suggest to the unsophisticated that there was a part of man which could leave his body and wander elsewhere during sleep. In order to save space, it will be helpful to classify the various types of belief which have existed in philosophical thought regarding this problem: (1) There is the idea that, although *something* survives bodily death, it is not necessarily eternal. Thus most primitive peoples were prepared to believe that man's spirit haunted the place around his grave and that food and drink should be set out for it, but that this spirit did not go on forever and gradually faded away. (2) The ancient Greeks and Hebrews believed for the most part that the souls of the dead went to a place of shades there to pine for the world of men. Their whining ghosts spent eternity in a dark, uninviting region in misery and remorse. (3) Other people, and there were many more of these, believed in the transmigration of souls with the former life of the individual determining whether his next life would be at a higher or lower level. Sometimes this process seems to have been thought of as simply going on and on, by others (*e.g.*, in Hinduism and Buddhism) as terminating in either non-sentience or union with God but in any case in annihilation of the self as self. Believers in this theory were the Greek philosophers Pythagoras, Empedocles, Plato (who believed that soul comes from God and strives to return to God, according to his own rather confused notions of the deity. If it fails to free itself completely from the body it will sink lower and lower from one body to another.) Plotinus held similar views to Plato, and many other religious sects in addition to those mentioned have believed in transmigration. (4) The belief of Plato and Aristotle that if souls continue to exist after death there is no reason why they should not have existed before birth (this in part is covered by (3)), but some have pointed out that eternity does not mean " from now on," but the whole of time before and after " now "—nobody, however, so far as one knows, held that *individual* souls so exist. (5) The theory that the soul does not exist at all and therefore immortality is meaningless: this was held by Anaximenes in early Greek times; by Leucippus, Democritus, and the other Greek atomists; by the Epicureans from the Greek Epicurus to the Roman Lucretius; by the British Hobbes and Hume; by Comte of France; and William James and John Dewey of America. (6) The thesis, held notably by Locke and Kant, that although we cannot prove the reality of soul and immortality by pure reason, belief in them should be held for moral ends. (For the orthodox Christian view *see* God and Man, Determinism and Free-will.) From this summary we can see that many philosophies and religions (with the important exceptions of Islam and Christianity) without denying a future life do deny the permanence of the individual soul in anything resembling its earthly form (*see* Spiritualism, Psychic research).

Imperialism, the practice by a country, which has become a nation and embarked upon commercial

and industrial expansion, of acquiring and administering territories, inhabited by peoples usually at a lower stage of development, as colonies or dependencies. Thus the "typical" imperialist powers of the 19th cent. and earlier were Britain, Belgium, Holland, Spain, and Portugal, whilst Germany, Italy, and Japan, which either did not have unity during this period or adequate industrial expansion, tried to make good their lacks in this direction by war in the 20th cent. The term "imperialism" is not easy to define today (although often enough used as a term of abuse). There is economic imperialism exerted, not through armies, but through economic penetration. There is what may be described as ideological imperialism, *e.g.*, the anti-communist crusade that led America (in the name of freedom) into acts of appalling inhumanity in Vietnam; the dogmatism that led the Soviet Union into the invasion of Czechoslovakia. The Afrikaners in South Africa pass laws to permit the exploitation of the black and coloured peoples in their midst. Israel, too, whatever one may think of its creation on humanitarian grounds, is surely a piece of land taken from the Arabs who formed 90 per cent of its population, by a people whose only rational claim is that their ancestors lived there two thousand years ago. Imperialism is a dangerous word and, before using it, we would do well to remember the retort of a British statesman who, when lecturing in America prior to Indian independence, was asked by an elderly matron: "What are you going to do about the Indians?" "Which Indians, madam —ours or yours?"

Irrationalism. An attitude that puts emotion and passion before reason, and which can be exploited for dubious ends.

Islam, the religion of which Mohammed (570–632) was the prophet, the word signifying submission to the will of God. It is one of the most widespread of religions. Its adherents are called Moslems or Muslims. Islam came later than the other great monotheistic religions (Judaism and Christianity) and may be regarded in some respects as a heresy. Mohammed accepted the inspiration of the Old Testament and claimed to be a successor to Moses, and although he did not recognise Jesus as God, he did recognise Him as a prophet (*see* Docetism).

The sacred book of Islam is the Koran, the most influential book in the world next to the Bible. According to Islamic belief the words were revealed to the prophet by God through the angel Gabriel at intervals over a period of 20 years, first at his native Mecca, and then at Medina. The book is divided into 114 *suras* or chapters: all but one begin with the words: "In the name of Allah, the Merciful, the Compassionate." It is written in classical Arabic, and Moslems memorise much or all of it. The Koran superseded the Gospel as Mohammed superseded Christ. Its ethical teachings are high.

The great advantage of Mohammedism is that, like orthodox Judaism, it is a literal-minded religion lived in everyday life. No Moslem is in any doubt as to exactly how he should carry on in the events of his day. He has five duties: (1) Once in his life he must say with absolute conviction: "There is no God but Allah, and Mohammed is His Prophet." (2) Prayer preceded by ablution must be five times daily—on rising, at noon, in mid-afternoon, after sunset, and before retiring. The face of the worshipper is turned in the direction of Mecca. (3) The giving of alms generously, including provisions for the poor. (4) The keeping of the fast of Ramadan, the holy month, during which believers in good health may neither eat nor drink nor indulge in worldly pleasures between sunrise and sunset. (5) Once in his life a Moslem, if he can, must make the pilgrimage to Mecca. In addition, drinking, gambling, and the eating of pork are forbidden and circumcision is practised. Polygamy is permitted, although decreasing; sexual relations outside marriage are disapproved of; marriage is only with the wife's consent; and divorce may be initiated by either husband or wife. A great advantage in the spread of Islam has been its lack of race prejudice.

Mohammed's main achievements were the destruction of idolatry, the welding of warring tribes into one community, the progress of a conquest which led after his death to the great and cultured empire which spread throughout the Middle East into north Africa, north India, and ultimately to Spain. That it did not spread all over Europe was due to the Muslim defeat by Charles Martel at Tours in 732 A.D.

J

Jainism. The Jains are a small Indian sect, largely in commerce and finance, numbering about 2 million. Their movement founded by Vardhamana, called Mahavira (the great hero), in the 6th cent. B.C. arose rather earlier than Buddhism in revolt against the ritualism and impersonality of Hinduism (*q.v.*). It rejects the authority of the early Hindu Vedas and does away with many of the Hindu deities whose place is largely taken by Jainism's twenty-four immortal saints; it despises caste distinctions and modifies the two great Hindu doctrines of *karma* and transmigration. Jain philosophy is based on *ahimsa*, the sacredness of all life, regarding even plants as the brethren of mankind, and refusing to kill even the smallest insect.

Jehovah's Witnesses, a religious body who consider themselves to be the present-day representatives of a religious movement which has existed since Abel "offered unto God a more excellent sacrifice than Cain, by which he obtained witness that he was righteous." Abel was the first "witness," and amongst others were Enoch, Noah, Abraham, Moses, Jeremiah, and John the Baptist. Pre-eminent among witnesses, of course, was Jesus Christ who is described in the Book of Revelation as "the faithful and true witness." Thus they see themselves as "the Lord's organisation," in the long line of those who through the ages have preserved on earth the true and pure worship of God or, as the Witnesses prefer to call Him, "Jehovah-God."

So far as other people are aware, the movement was founded by Charles Taze Russell (Pastor Russell) of Allegany, Pittsburgh, Pennsylvania, U.S.A. in 1881 under the name, adopted in 1896, of the Watch Tower Bible and Tract Society, which has continued as the controlling organisation of Jehovah's Witnesses. Its magazine, *The Watch Tower Announcing Jehovah's Kingdom*, first published in 1879, and other publications are distributed by the zealous members who carry out the house-to-house canvassing. The movement has a strong leadership.

Their teaching centres upon the early establishment of God's new world on earth, preceded by the second coming of Christ. Witnesses believe this has already happened, and that Armageddon "will come as soon as the Witness is completed." The millennial period will give sinners a second chance of salvation and "millions now living will never die" (the title of one of their pamphlets).

The dead will progressively be raised to the new earth until all the vacant places left after Armageddon are filled. There is, however, some doubt about the "goatish souls" who have made themselves unpleasant to the Witnesses, those who have accepted (or permitted to be accepted) a blood-transfusion contrary to the Scriptures, and others who have committed grave sins.

Every belief held by the movement, it is claimed, can be upheld, chapter and verse, by reference to the Scriptures. Witnesses regard the doctrine of the Trinity as devised by Satan. In both wars Witnesses have been in trouble for their refusal to take part in war and it is only fair to add that six thousand suffered for the same reason in German concentration camps.

Jensenism, name given to the minority group of psychologists and educationalists who, in general, support the view of the American professor, Arthur Jensen. The latter's studies of individual variation in learning and of the genetic factor in mental ability has led him to argue that heredity is more crucial in determining intellectual ability than environment. By implication this has put him and his col-

leagues at the centre of a divisive "race and intelligence" controversy which has acquired some political overtones. In 1973 Professor H. J. Eysenck was physically assaulted by students at a university lecture because he was reputed to be supporting the Jensenist position.

Jesus People, naïve and exhibitionist revival of interest in the teaching and personality of Jesus Christ which has recently featured as part of the American "Hippy" scene. The Jesus people or Jesus Freaks, as they are sometimes called, are generally white but not necessarily of an orthodox Christian background. The cult, like so many others of its kind seems to have developed in California and its adherents adopt the regimental attire (colourful costumes, long hair, beards, etc.) of the modern American Hippy, who is himself a descendant of the Beatnik (*see* Beat Generation). Apart from the fact that the long hair and beards are vaguely reminiscent of the Victorian pictorial representation of Jesus, the followers of the present-day cult would seem to have little genuinely in common with the ethos of Christianity, and the movement and its ideals appear to be superficial and probably transitory. A recent highly successful rock musical, "Jesus Christ, Superstar," blatantly cashes in on the Jesus Freak vogue.

Judaism, the religion of the Jews, the oldest of the great monotheist religions, parent of Christianity and Islam, the development of which is presented in the Old Testament. The creed of Judaism is based on the concept of a transcendent and omnipotent One True God, the revelation of His will in the *Torah*, and the special relation between God and His "Chosen People." The idea of Incarnation is rejected, Jesus is not recognised as the Messiah. The *Torah* is the Hebrew name for the Law of Moses (the Pentateuch) which, Judaism holds, was divinely revealed to Moses on Mount Sinai soon after the exodus of the Israelites from Egypt (1230 B.C.). Many critics deny the Mosaic authorship of the first five books of the Bible and believe them to be a compilation from four main sources known as J (Jahvist), E (Elohist), D (Deuteronomist) and P (Priestly Code), distinguished from each other by the name used for God, language, style, and internal evidence. From the historical point of view an important influence on Judaism may have been the monotheism of Akhnaton, the "heretic" Pharaoh (note, for example, the striking resemblance between Psalm 104 and Akhnaton's "Hymn to the Sun").

The Talmud is a book containing the civil and canonical laws of the Jews and includes the Mishna, a compilation from oral tradition written in Hebrew, and the Gemara, a collection of comments and criticisms by the Jewish rabbis, written in Aramaic. There are in fact two Talmuds: the one made in Palestine (the Jerusalem Talmud), finished at the beginning of the 5th cent., and the other made in Babylon, completed at the end of the 6th cent.

Judaism at the beginning of the Christian era had a number of sects: (1) the Pharisees (whose views include the first clear statement of the resurrection of the just to eternal life and the future punishment of the wicked) who held to the *Torah* and the universality of God; (2) the Sadducees, the upper class of priests and wealthy landowners, to whom God was essentially a national God and who placed the interests of the state before the *Torah*; they rejected ideas of resurrection and eternal life; (3) the Essenes (*q.v.*) who were regarded as a puritanical break-away movement by both parties. The views of the Pharisees prevailed.

Jewish writing continued through the years and some books were added to the *Torah*, among them the Three Major Prophets and certain books of the Twelve Minor Prophets. There were also the Apocalyptic writers who were unorthodox in their preaching of a divinely planned catastrophic end to the world with a "new Heaven and a new earth," preceded by a divine Messiah, and a future life—all of which beliefs influenced early Christianity. Judah Halevi of Toledo (*c.* 1085–*c.* 1140) and Moses Maimonides of Cordova (1135–1204) were the great Jewish philosophers.

Modern movements in Judaism stem from the Enlightenment, notably with Moses Mendelssohn in the 18th cent. who accepted, as was the tendency of the period, only that which could be proved by reason. He translated the Pentateuch into German thus encouraging German Jews to give up Yiddish and Hebrew for the language of the land and thereby preparing them for their vast contribution to Western civilisation. One of his disciples, David Friedländer (d. 1834) instituted "reform" Judaism behind which lay the desire for assimilation. He wanted to eliminate anything that would hamper the relationships of Jews with their neighbours or tend to call in doubt their loyalty to their adopted state. A similar movement in America (1885) called for the rejection of dietary laws, the inauguration of Sunday services, and the repudiation of Jewish nationalism. Between "reform" and orthodoxy there arose the conservative movement which, in England, includes prayers in English in the service, does not segregate men and women in the synagogue, and translates the Law in a more liberal way. (The fact is that it would be almost impossible for a strictly orthodox Jew to live in a modern industrialised community at all.)

Judaism is essentially a social and family religion which, more than almost any other, concerns itself with the observances of every aspect of daily life. As in Islam (*q.v.*) details are laid down in the most minute way for the behaviour of the orthodox.

The home is the main Jewish institution and Jews, like Catholics, cannot surrender their religion. Circumcision takes place eight days after birth, and a boy becomes a man for religious purposes at his Bar Mitzvah at the age of thirteen. Women are spared most of this because their place in the home is considered sufficiently sacred. Among festivals are Passover, recalling the Exodus; Rosh Hashanah (the Jewish New Year), the anniversary of the Creation and the beginning of ten days of penitence ending with Yom Kippur (the Day of Atonement), a day of fasting spent in the synagogue; Purim, celebrating the deliverance of the Jews from Haman; and Chanukah, celebrating their victory against the Syrians under their leader Judas Maccabeus. A new and semi-religious festival is the Yom Haatzmaut, the anniversary of the birth of the new Jewish state of Israel.

K

Kabbala. *See* Cabala.

Ku Klux Klan. After the American Civil War (1861–65) southern conservatives and ex-Confederate leaders began to fear (as they had every reason to do) both Negro and poor White rule. Taxes were rising owing to radical legislation and the tax-burdened and disenfranchised planters finally took to illegal means to achieve their ends by trying to effect an alliance with the poor White and small farmer through appealing to his anti-Negro prejudice.

Hence the Ku Klux Klan was formed in 1866 as a secret society by a small group of Confederate veterans in Tennessee with the intention of frightening Negroes by dressing in ghostly white robes in the guise of the spirits of dead soldiers. But the movement spread like wild-fire throughout the South encouraged by small farmers and planters alike. General Nathan Bedford Forrest was appointed "Grand Wizard" of the Klan "empire" and in every community armed Klansmen riding at night horsewhipped "uppity" Negroes, beat Union soldiers, and threatened carpet-bag politicians (*i.e.*, fortune-hunters from the North). Soon several similar organisations arose, many of which did not stop at torture, burning property, and murder. In fact, although claiming to be a "holy crusade" the Klan was a vicious and contemptible organisation in which former Southern leaders trying to regain control deliberately set poor and middle-class Whites against the Negroes by appeal to race-prejudice. Congress struck back with laws and intervention of Federal troops, and after a large number of convictions in South Carolina much of the violence stopped even if the feelings continued.

After the 1914–18 war the movement, dor-

mant since 1900, revived as a sadistic anti-Negro, anti-Jewish, anti-Catholic society, spreading to the north as well as the south. By 1926, with its white-gowned hooligans and fiery crosses, the Klan began to subside once more. But it rose again after the second world war, and their were some cruel racial murders in Alabama during 1964–5.

Kuomintang, a Chinese Nationalist party founded in 1891 by Sun Yat Sen. It took part in the first Chinese revolution of 1911 and led the second the following year, dominating south China by 1930 and, under Chiang Kai-shek, who succeeded Sun Yat Sen on his death in 1925, conducted China's defence against Japanese invasion from 1937–45. Sun Yat Sen had attempted to found a democratic republic based on Western parliamentary democracy and in his famous *Testament* laid down the principles upon which the constitution of China should be based. In 1946, Sun Fo, the son of Sun Yat Sen, deplored the party's departure from the principles of social democracy and the welfare of the people in which his father had believed. Beginning as a movement largely inspired by Russia, the Kuomintang under Chiang Kai-shek degenerated into a reactionary and corrupt military oligarchy which, collapsing in 1949, was replaced by the Communist party, leaving Chiang and his followers to rule Formosa with American aid.

L

Lamaism, the religion of Tibet. Its beliefs and worship derive from the Mahayana form of Buddhism which was introduced into Tibet in 749 A.D. The emphasis laid by its founder on the necessity for self-discipline and conversion through meditation and the study of philosophy deteriorated into formal monasticism and ritualism. The Dalai Lama, as the reincarnated Buddha, was both king and high priest, a sort of pope and emperor rolled into one. Under him was a hierarchy of officials in which the lowest order was that of the monks who became as numerous as one man in every six or seven of the population. The main work carried out by this vast church-state was the collection of taxes to maintain the monasteries and other religious offices. Second in power to the Dalai Lama was the Panchen or Tashi Lama believed to be a reincarnation of Amitabha, another Buddha. The last Dalai Lama fled to India in 1959 when the Chinese entered his country. For a brief period following his departure, the Panchen Lama surprised the Western world by publicly welcoming the Communist invasion. How much of this was due to coercion at the time is not clear, but he later renounced the regime and the suppression of Lamaism in Tibet continued unchecked.

Levellers, an English military-politico-religious party prominent in the Parliamentary Army about 1647 which stood for the rights of the people. *See* Diggers.

Liberalism. The Liberal Party is the successor to the Whigs (a nickname derived from *whiggamore* used in the 17th cent. for Scottish dissenters) of the 18th and 19th cent. Prior to the victory of the Labour Party in 1922, it was one of the two main British political parties. Liberals are moderately progressive in the sense that most appreciate the humanistic aspects of socialism while strongly disapproving of its policies of state control, and they dislike any form of monopoly, state-run or otherwise. In general, the Party advocates co-ownership in industry, electoral reform (proportional representation), protection of individual liberties, governmental reform, tax reform, strict measures against any form of monopoly, and separate parliaments for Scotland and Wales. In the 1950s the Liberal Party in Britain was generally assumed to be almost defunct and there were even suggestions that it might be formally "wound up." The 1960s saw a slow and arguable revival which has certainly accelerated in the past year or so. Part of the reason for this revival has been general public disaffection with the way in which the two major parties are coping with the serious political problems of the decade. The present vogue for intensive local or "community" politics also seems to have been spear-headed by the Liberals and this may account for its increasing attraction fro the young voter.

Logical Positivism, a school of philosophy founded in Vienna in the 1920s by a group known as "the Vienna circle": their work was based on that of Ernst Mach, but dates in essentials as far back as Hume. Of the leaders of the group, Schlick was murdered by a student, Wittgenstein came to Britain, and Carnap went to America following the entry of the Nazis. Briefly the philosophy differs from all others in that, while most people have believed that a statement might be (*a*) true, or (*b*) false, logical positivists consider there to be a third category; a statement may be meaningless. There are only two types of statement which can be said to have meaning: (1) those which are tautological, *i.e.*, those in which the statement is merely a definition of the subject, such as "a triangle is a three-sided plane figure" ("triangle" and "three-sided plane figure" are the same thing); and (2) those which can be tested by sense experience. This definition of meaningfulness excludes a great deal of what has previously been thought to be the field of philosophy; in particular it excludes the possibility of metaphysics. Thus the question as to whether there is a God or whether free-will exists is strictly meaningless, for it is neither a tautological statement nor can it be tested by sense-experience.

Lollards, a body of religious reformers and followers of Wyclif who were reviled and persecuted in the reign of Richard II. The name "Lollard" comes from the old English word meaning "mutterer"—a term of contempt used to describe the sect. Henry IV renewed his father's persecution of the group, even condemning one of his own personal friends, the Lollard leader Sir John Oldcastle, to be burnt at the stake.

Luddites, a group of peasants and working men who deliberately destroyed spinning and farm machinery in England in the early part of the 19th cent., fearing that such devices would destroy their livelihood. Their name was taken from the eccentric Ned Lud who had done the same in a less organised way two or three decades earlier. The Luddites' worst fears were of course not realised, for far from putting human beings out of work the industrial revolution created jobs for a vastly increased population. Luddism, dormant for over a century, is beginning to appear again, if in muted form. Public anxiety about the rapid growth in computer technology is manifesting itself in the form of such groups as the Society for the Abolition of Data Processing Machines, which while not of course dedicated to the physical destruction of computers, urge for social and even governmental checks on the development of such things as "data banks." These are vast computer memory stores listing comprehensive records concerning all the people living in a city or country and able to cross-reference them in a way that has never previously been possible. The arguments for and against such data banks and other developments in computer technology are beyond the scope of this section, but the rise of this 20th cent. Luddism is of considerable historical and social significance.

Lutheranism. The Reformation had a long history before it became, under Luther and Calvin, an accepted fact. The mediaeval Church had held (as the Catholic Church holds today) that the sacraments were the indispensable means of salvation. Since these were exclusively administered by the clergy, any movement which attacked clerical abuses was forced by sheer necessity to deny the Church's exclusive control of the means of salvation, before it could become free from dependence on a corrupt priesthood. Hence the Albigenses and the Waldenses (*qq.v.*), the followers of John Hus and Wyclif (*see* Anticlericalism), were bound to deny the authority of the Church and emphasise that of the Bible. Luther began his movement primarily in order to reform the Church from its gross abuses and the famous ninety-five theses nailed to the door of the Church at Wittenberg in 1517 were not primarily theological but moral complaints dealing

with the actual behaviour of the clergy rather than Church beliefs. But unlike the earlier reformers, Luther had arrived at the right moment in history when economic individualism and the force of nationalism were bound, sooner or later, to cause the authorities in Germany to line up on his side. Thus he began with the support of the peasants who were genuinely shocked at the abuse of indulgences and other matters, but ended up by being supported by the noblemen who wanted to destroy the power of the pope over the German states and looked forward to confiscating the lands and property of the Church. When the peasants wanted the reform of actual economic abuses relating to the feudal system, Luther took the side of the nobles against them. The contemporary movement in Switzerland led by Ulrich Zwingli had no such secular support, and Zwingli was killed in 1531.

Martin Luther (1483–1546) was the son of a miner in Eisleben in Saxony, entered the order of Austin Friars in 1505, and later taught at the newly founded university of Wittenberg. After the publication of the theses the real issue so far as the Church was concerned was whether he was willing or not to submit to the authority of his superiors; Luther refused to compromise with his conscience in the famous words: "Here I stand; I can do no other." In a further statement Luther recommended the formation of a German national church, the abolition of indulgences and other means whereby Rome obtained money from Germany, and an end to the celibacy of the clergy. For this he was naturally excommunicated. His teaching was based on the German translation of the Bible, but he was by no means a fundamentalist: *e.g.*, he denied that the Book of Hebrews was written by Paul, would have nothing to do with the Apocalypse, and regarded the letter of James as "an epistle of straw." The Scriptures were open to all and could be interpreted by private judgment enlightened by the Spirit of God. Like Calvin, Luther was a predestinarian and determinist, but he was also a conservative and soon became alarmed about the position taken by many extremists once the Reformation was under way. He had really wanted the Church to reform itself, but when he alienated Rome he had perforce to rely more and more on the secular powers which finally resulted in the state-church form which became pronounced in Prussia and later elsewhere. Whereas Calvin wished the Church to be at least the equal of the State and in some respects its superior, Luther's rebellion resulted in the reverse, a state-controlled episcopalianism. *See* Calvinism, Presbyterianism.

Lycanthropy, the belief that men may, by the exercise of magical powers or because of some inherited affliction, occasionally transform into wolves. The so-called werewolf is an important feature of mid-European folklore and much the same can be said of the were-tigers and were-bears of Africa and the Far East. There is, needless to say, no such thing as a genuine werewolf known to biology, but it is not hard to see how legends of their existence could arise. There are a number of mental illnesses in which men may deliberately or unconsciously mimic the actions of animals and there are a number of endocrinological disorders which may cause gross changes in the features of the individuals, including the excessive growth of hair. In times when the physiological bases of such afflictions were not properly understood, sufferers from such complaints could easily be persuaded, either by themselves or others, that they were in fact wolfmen. Once the mythology of lycanthropy is established in a society, then of course it will be used by unscrupulous individuals for their own ends —for example revenge killings by people dressed as animals—thus helping to perpetuate the legend.

M

McLuhanism. According to Marshall McLuhan, a Canadian, and former professor of English at Toronto University, the *way* people communicate is more important than *what* they communicate: hence his famous slogan, "the medium is the message." There have been two great landmarks in human understanding since we learnt to speak and write: the invention of the printed book and the present electronic revolution. The printed word took us step by step along the linear, logical path to understanding; television comes at us from all directions at once. "Electronic circuitry has overthrown the regime of 'time' and 'space' . . . Its message is Total Change." Thus the spectacle of the Chicago police force clubbing people outside the Democratic Convention in August 1968 was described by Alistair Cook, in a despatch to *The Guardian*, as "a terrifying demonstration of McLuhanism: the millions frozen with terror in front of their television screens." In his essay, "On Reading Marshall McLuhan," Dr. George Steiner (one of the first critics in England to understand him) writes: "Marshall McLuhan posits that Western civilisation has entered, or is about to enter an era of electromagnetic technology. This technology will radically alter the milieu of human perception, the reality co-ordinates within which we apprehend and order sense data. Experience will not present itself serially, in atomized or linear patterns of casual sequence, but in 'fields' of simultaneous interaction." McLuhan's importance lies in alerting us to the present clash between two great technologies, the literate and the electromagnetic, and in his vision, beyond the present chaos, of a world drawn tighter together in a "global village" where identity will merge in collectivity and we shall all be able to cooperate for the common good instead of being split up into warring nations.

Magic, a form of belief originating in very early days and based on the primitive's inability to distinguish between similarity and identity. The simplest example would perhaps be the fertility rites in which it is believed that a ceremony involving sexual relations between men and women will bring about fertility in the harvest. Or the idea that sticking pins in an image of an individual will bring about harm or even death to the real person. Magic is regarded by some as a form of early science in that man in his efforts to control Nature had recourse to magical practices when the only methods he knew had failed to bring the desired results. It filled a gap. By others magic is regarded as an elementary stage in the evolution of religion. It can be said to have served a purpose there too. Yet magic differs from religion, however closely at times it may come to be related with it, in this important respect: religion depends upon a power *outside and beyond* human beings, whereas magic depends upon nothing but the casting of a spell or the performance of a ceremony—the result follows automatically.

The idea that "like produces like" is at the roots of imitative magic, and it is interesting to note that in some languages (*e.g.*, Hebrew and Arabic) there is no word for "resembles" or "similar to." Hence one says "All thy garments are myrrh" instead of "are *like* myrrh." It follows that an event can be compelled by imitating it. One engages in swinging, not for pleasure, but to produce a wind as the swing does; ball games are played to get rainy weather because the black ball represents dark rain-clouds; other ball games, in which one attempts to catch the ball in a cup or hit it with a stick, represent the sexual act (as some gentlemen at Lords may be distressed to hear) and bring about fertility; in medicine up till a few centuries ago herbs were chosen to cure a disease because in some respects their leaves or other parts looked like the part of the body affected (*e.g.*, the common wildflower still known as "eyebright" was used in bathing the eyes because the flower looks like a tiny eye). *See* Witchcraft, Demonism.

Malthusianism, the theory about population growth put forward by the Rev. Thomas Malthus (1766–1834) in *An Essay on Population* (1798). His three main propositions were: (1) "Population is necessarily limited by means of subsistence." (2) "Population invariably increases where means of subsistence increase,

unless prevented by some very powerful and obvious checks." (3) "These checks, and the checks which repress the superior power of population, and keep its effects on a level with the means of subsistence, are all resolvable into moral restraint, vice and misery." In other words, no matter how great the food supply may become, human reproductive power will always adjust itself so that food will always be scarce in relation to population; the only means to deal with this is by "moral restraint" (*i.e.*, chastity or not marrying), "vice" (*i.e.*, birth-control methods), or misery (*i.e.*, starvation). More specifically, Malthus claimed that while food increases by arithmetical progression, population increases by geometrical progression.

It is true that these gloomy predictions did not take place in Malthus's time largely owing to the opening up of new areas of land outside Europe, the development of new techniques in agriculture, the growth of international trade to poorer areas the increased knowledge of birth-control, and developments in medical science which reduced the misery he had predicted. Furthermore, we now know that as a society becomes industrialised its birth-rate tends to fall. Nevertheless there are very few scientists who are not perturbed by the growth in the world's population which has increased from about 465 million in 1650 to over 3,000 million today.

Manichaeism, an Asiatic religion which developed from Zoroastrianism (*q.v.*) and shows the influence of Buddhism (*q.v.*) and Gnosticism (*q.v.*), being founded by Mani, a Persian, who was born in Babylonia, *c.* 216 A.D. Mani presented himself to Shapur I as the founder of a new religion which was to be to Babylonia what Buddhism was to India or Christianity to the West. His aspiration was to convert the East and he himself made no attempt to interfere directly with Christianity although he represented himself as the Paraclete (the Holy Ghost or "Comforter") and, like Jesus, had twelve disciples. His success in Persia aroused the fury of the Zoroastrian priests who objected to his reforming zeal towards their religion and in 276 Mani was taken prisoner and crucified.

Of Mani's complicated system little can be said here, save that it is based on the struggle of two eternal conflicting principles, God and matter, or light and darkness. Although its founder had no intention of interfering with the West, after his death his followers soon spread the religion from Persia and Mesopotamia to India and China. (Manichaeism flourished in China until the 11th cent.) It reached as far as Spain and Gaul and influenced many of the bishops in Alexandria and in Carthage where for a time St. Augustine accepted Manichaeism. Soon the toleration accorded it under Constantine ended and it was treated as a heresy and violently suppressed. Yet it later influenced many heresies, and even had some influence on orthodox Catholicism which had a genius for picking up elements in other religions which had been shown to appeal to worshippers provided they did not conflict unduly with fundamental beliefs.

Maoism is the branch of communism that reigns in China. It has been shaped by one of the most remarkable statesmen of modern times, Mao Tse-tung, who has set the pattern of revolution for poor peasant societies. The communist movement may be likened to a river with three principal streams: the left, represented by China, the right, represented by Yugoslavia, and the middle, represented by the Soviet Union. In Russia the civil war developed *after* the revolution; in China the communists fought their civil war *before* they seized power; the Yugoslav partisans won their own guerrilla war against the fascist powers—differences which had important political consequences. Russia suffered three decades of isolationism and totalitarian suppression ("an isolated and besieged fortress") before the death of Stalin. Then came a marked, if zigzagging shift towards "liberalisation." Mao Tse-tung holds to the orthodox Leninist view about capitalism and communism, regards *détente* as a dangerous illusion and compromise and "revisionism" as a fatal error. The ideological dispute between these two great communist powers has developed since 1960 when Khrushchev ruthlessly withdrew economic aid and technical assistance and forced China into isolationism. It has been likened to the East–West schism in the Christian church. The solution is by no means predictable but having come through the "hundred flowers" campaign, the "great leap forward," and the "cultural revolution," China in 1971 decided to end its years of diplomatic isolation. *See* Section C, Part I.

Marxism. The sociological theories founded by Karl Marx and Friedrich Engels on which modern communist thought is based. Marx and Engels lived in a period of unrestrained capitalism when exploitation and misery were the lot of the industrial working classes, and it was their humanitarianism and concern for social justice which inspired their work. They co-operated in 1848 in writing the *Communist Manifesto*, and in his great work, *Das Kapital* (1867), Marx worked out a new theory of society. He showed that all social systems are economically motivated and change as a result of technical and economic changes in methods of production. The driving force of social change Marx found to be in the struggle which the oppressed classes wage to secure a better future. Thus in his celebrated theory of historical materialism he interpreted history in terms of economics and explained the evolution of society in terms of class struggle. (*See* Dialectical Materialism.) "In the social production of their means of existence," he wrote, "men enter into definite and unavoidable relations which are independent of their will. These productive relationships correspond to the particular stage in the development of their material productive forces." Marx's theory of historical materialism implies that history is propelled by class struggle with communism and the classless society as the final stage when man will have emancipated himself from the productive process. Marx was the first to put socialism on a rational and scientific basis, and he foretold that socialism would inevitably replace capitalism. His prophecy, however, came to realisation not in the advanced countries as he had envisaged but in backward Russia and China. *See also* Communism.

Mennonites. *See* Baptists.

Menshoviks. *See* Bolshevism.

Mesmerism, a rapidly vanishing name to denote the practice of hypnosis, which owes its popularity, though not its discovery, to the Austrian physician, Anton Mesmer (1733–1815). Mesmer's contribution was the realisation that a large number of what we would today call psychosomatic or hysterical conditions could be cured (or at least temporarily alleviated) by one or another form of suggestion. Mesmer himself relied on the idea of what he called "animal magnetism," a supposedly potent therapeutic force emanating from the living body which could be controlled by the trained individual. Mesmer used wands and impressive gadgetry to dispense the marvellous force and he effected a remarkable number of cures of complaints, hitherto looked upon as incurable or totally mysterious in origin—the most typical of these being hysterical blindness, paralysis or deafness, nervous skin conditions, and so on. Hypnosis, which is a valid if very poorly understood psychological phenomenon even today, would probably have been developed much further had not efficient general anaesthetics such as ether, nitrous oxide, etc., been discovered, thus greatly diminishing its role as a pain reliever in surgery. *See* Hypnotism, J57.

Mesmer, who was three parts charlatan, never really troubled to think deeply about the cause of his undoubted successes. The first man to treat hysteria as a formal class of illness and who made a scientific attempt to treat it with hypnosis was Ambrose Liébeault (1823–1904). He and his colleague Hippolyte Bernheim (1840–1919) believed: (*a*) that hysteria was produced by suggestion, and particularly by autosuggestion on the part of the patient, and (*b*) that suggestion was a normal trait found in varying degrees in everyone. These con-

clusions are true, but as Freud showed later are far from being the whole truth.

Messianism. Most varieties of religious belief rely on the assumption that the deity is a supernatural being either permeating the universe or dwelling in some other sphere, and normally inaccessible to man. Where divine intervention is necessary, the deity is traditionally believed to nominate a human being—in the case of Christianity, for example, Jesus is believed to be the actual son of God. Messianic cults introduce a novel variant on the traditional theme. In these a human being is held to be God himself. He may either nominate himself for this role, relying on his own personality or native talent to acquire the necessary following, or for one reason or another large numbers of people may alight on one individual and declare him the Messiah. While it might seem that beliefs of this kind would be confined to earlier epochs in man's recorded history, this is in fact not the case. In the past century, and even within recent decades, a number of individuals have been held by groups to be actually divine. Among these were the Dutchman Lourens van Voorthuizen, a former fisherman who declared himself to be God in 1950 and got large numbers to accept his claim; the Anglican priest Henry James Prince, who did much the same thing in 1850; and of course the famous Negro George Baker, who convinced hundreds of thousands of other Negroes that he was "Father Divine." To simple people the idea that God is to be found on earth and that one may even be personally introduced to him, is an obviously attractive one. The trouble is that all self-styled Gods to this present date have sooner or later seriously disappointed their supporters by performing that most human of acts—dying.

Metapsychology. Not to be confused with parapsychology (*q.v.*). The branch or off-shoot of psychology which goes beyond empirical and experimental studies to consider such philosophical matters as the nature of mind the reality of free will and the mind/body problem. It was originally used by Freud as a blanket descriptive term denoting all mental processes, but this usage is now obsolete.

Methodism, the religious movement founded by John Wesley in 1738, at a time when the Anglican Church was in one of its periodic phases of spiritual torpor, with the simple aim of spreading "scriptural holiness" throughout the land. Up to that time Wesley had been a High Churchman but on a visit to Georgia in the United States he was much impressed by the group known as Moravians (*q.v.*), and on his return to this country was introduced by his brother Charles, who had already become an adherent, to Peter Böhler, a Moravian minister in England. Passing through a period of spiritual commotion following the meeting, he first saw the light at a small service in Aldersgate in May 1738 "where one was reading Luther's preface to the Epistle to the Romans" and from this time forth all Wesley's energies were devoted to the single object of saving souls. He did this for fifty years and at the end of his life confessed that he had wasted fifteen minutes in that time by reading a worthless book. Even when he was over eighty he still rose at 4 a.m. and toiled all day long.

Soon Whitefield, a follower with Calvinist views, was preaching throughout the country and Charles Wesley was composing his well-known hymns; John's abilities at this time were taken up in organising the movement described as "People called Methodists." They were to be arranged in "societies" which were united into "circuits" under a minister, the circuits into "districts" and all knit together into a single body under a conference of ministers which has met annually since 1744. Local lay preachers were also employed and to maintain interest the ministers were moved from circuit to circuit each year. These chapel services were not originally meant to conflict with the Church of England of which Wesley still considered himself a member. They were purely supplementary, and it used to be the custom (before the Methodists began to count themselves as Nonconformists) for Methodists to attend Church in the morning and Chapel in the evening.

The class-meeting was the unit of the organisation where members met regularly under a chosen leader to tell their "experiences" upon which they were often subjected to severe cross-examination. At the end of every quarter, provided their attendances were regular, they received a ticket of membership which entitled them to come to monthly sacramental services. If attendance was inadequate the name was removed from the list, without appearance on which nobody was deemed a member. The price of the ticket was "a penny a week and a shilling a quarter" but Wesley was not interested in receiving money from anyone who was not utterly devoted to the cause.

John Wesley introduced four other innovations, some of which were regarded by Churchmen who had previously been willing to commend his efforts in bringing religion to the poorer classes as dangerous: (1) He started the Sunday-school scheme and afterwards enthusiastically supported that of John Raikes, often regarded as the founder of the idea; this was of immense importance in the days before the Education Acts. (2) He reintroduced the Agapae or "love feasts" of the early Church which were fellowship meetings deepening the sense of brotherhood of the society. (3) He began to copy the open-air meetings of the eloquent Whitefield and soon unwittingly produced the most extraordinary results, finding that his sermons led to groans, tears, fainting-fits, and all sorts of emotional expression. Even his open-air lay speakers produced like results and these came to be associated with Methodism and gave significance to the proud Anglican claim that *their* services would be "without enthusiasm." (4) After some hesitation he ventured to consecrate Dr. Thomas Coke, who was being sent as a missionary to America, as a bishop of his church. In addition to Wesley's religious work he was a great educator of the common man. Thus he introduced the cheap book and the church magazine, publishing books of any sort which he thought would edify and not harm even when the views expressed were different from his own—*e.g.*, Thomas à Kempis's *Imitation of Christ* and works of history, biography, science, and medicine in some cases written by himself. In this way the movement with its cheap books and reading rooms had an influence far beyond its actual membership. Both the Anglican Church and the Evangelical movement of Wilberforce and others profited from Wesley's work. Some social historians, rightly or wrongly, have claimed that it was Wesley's influence among the working classes that spared England the revolutionary activity which characterised most other European countries during the first quarter of the 19th cent.

Methodism, especially after Wesley's death in 1791, began, like other movements, to develop schisms. There were the long-standing differences which the Baptist movement (*q.v.*) had shown too between Arminian and Calvinist sections—*i.e.*, between those who did and those who did not accept the doctrine of predestination. In the case of the Methodists, this led to a complete break in 1811. Then there were differences associated with the status of the laity, or the relationship of the movement with the Anglican Church. The "Methodist New Connection" of 1797 differed only in giving the laity equal representation with the ministers but the more important break of the Primitive Methodists in 1810 gave still more power to the laity and reintroduced the "camp-meeting" type of service. In 1815 the Bryanites or "Bible Christians" were formed, and a further schism which was even brought before the law courts was ostensibly over the foundation of a theological college. The real reason, of course, was that the ministers were becoming more Tory, whilst the laity were becoming more Radical. Finally in 1932, at a conference in the Albert Hall in London, the Wesleyan Methodists, the Primitive Methodists, and the United Methodists became one Church, the Methodist Church. Including America, where Methodism under the original direction of Thomas Coke spread like wildfire, the Methodist is one of the largest Protestant Churches of today.

Mind and Matter.

Early Greek Views: Idealism and Dualism. Primitive peoples could see that there is a distinction between those things which move and do things by themselves and others, such as stones, which do not. Following the early state of Animism (*q.v.*), in which spirits were believed to have their abode in everything, they began to differentiate between matter or substance and a force which seems to move it and shape it into objects and things. Thus to the Greek Parmenides (fl. c. 475 B.C.), who was a philosopher of pure reason, thought or mind was the creator of what we observe and in some way not quite clear to himself it seemed that mind was the cause of everything. This is perhaps the first expression of the movement known as Idealism which says, in effect, that the whole universe is mental—a creation either of our own minds or the mind of God. But from Anaxagorus (488–428 B.C.) we have the clearer statement that mind or *nous* causes all movement but is distinct from the substance it moves. He does not, however, think in terms of individual minds but rather of a kind of generalised mind throughout the universe which can be used as an explanation of anything which cannot be explained otherwise. This is the position known as **Dualism** (*q.v.*) which holds that both mind and matter exist and interact but are separate entities.

Most people in practice are dualists since, rightly or wrongly, mind and body are thought of as two different things; it is the "commonsense" (although not necessarily the true) point of view. Plato in a much more complex way was also a dualist although he held that the world of matter we observe is in some sense not the genuine world. The real world is the world of ideas and the tree we see is not real but simply matter upon which mind or soul has imprinted the idea of a tree. Everything that exists has its corresponding form in the world of ideas and imprints its pattern upon matter. Mind has always existed and, having become entangled with matter, is constantly seeking to free itself and return to God.

Plato's pupil Aristotle had a much more scientific outlook and held that, although it was mind which gave matter its form, mind is not *outside* matter, as Plato had thought, but *inside* it as its formative principle. Therefore there could be no mind without matter and no matter without mind; for even the lowest forms of matter have some degree of mind which increases in quantity and quality as we move up the scale to more complex things.

So far, nobody had explained how two such different substances as matter and mind could influence each other in any way, and this remains, in spite of attempts to be mentioned later, a basic problem in philosophy.

Two later ideas, one of them rather foolish and the other simply refusing to answer the question, are typified by the Stoics and some members of the Sceptic school. The first is that only matter exists and what we call mind is merely matter of a finer texture, a view which as an explanation is unlikely to satisfy anyone; the other, that of some Sceptics, is that we can know nothing except the fleeting images or thoughts that flicker through our consciousness. Of either mind or matter we know nothing.

Renaissance Attitude. Christian doctrines have already been dealt with (*see* **God and Man, Determinism and Free-will**), and the past and future of the soul is dealt with under **Immortality**. Nor need we mention the Renaissance philosophers who were really much more concerned about how to use mind than about its nature. When they did consider the subject they usually dealt with it, as did Francis Bacon, by separating the sphere of science from that of religion and giving the orthodox view of the latter because there were still good reasons for not wishing to annoy the Church.

17th-cent. Views: Hobbes, Descartes, Guelincx, Spinoza, Locke, Berkeley. Thomas Hobbes in the 17th cent. was really one of the first to attempt a modern explanation of mind and matter even if his attempt was crude. As a materialist he held that all that exists is matter and hence our thoughts, ideas, images, and actions are really a form of motion taking place within the brain and nerves. This is the materialist theory which states that mind does not exist.

Thus there are three basic theories of the nature of mind and body: idealism, dualism, and materialism, and we may accept any one of the three. But, if we accept dualism, we shall have to explain precisely the relationship between body and mind. In some of his later writings Hobbes seems to suggest that mental processes are the effects of motion rather than motion itself; *i.e.*, they exist, but only as a result of physical processes just as a flame does on a candle. This theory of the relationship is known as *epiphenomenalism.*

Descartes, the great French contemporary of Hobbes, was a dualist who believed that mind and matter both exist and are entirely different entities; therefore he had to ask himself how, for example, the desire to walk leads to the physical motion of walking. His unsatisfactory answer was that, although animals are pure automatons, man is different in that he has a soul which resides in the pineal gland (a tiny structure in the brain which today we know to be a relic of evolution with no present function whatever). In this gland the mind comes in contact with the "vital spirits" of the body and thus there is interaction between the two. This theory is known as *interactionism*, and since we do not accept its basis in the function of the pineal gland, we are simply left with the notion of interaction but without the explanation of how it takes place.

One of Descartes's successors, Arnold Guelincx, produced the even more improbable theory of *psychophysical parallelism*, sometimes known as the theory of the "two clocks." Imagine you have two clocks, each keeping perfect time, then supposing you saw one and heard the other, every time one points to the hour the other will strike, giving the impression that the first event causes the second, although in fact they are quite unrelated. So it is with the body and mind in Guelincx's view, each is "wound up" by God in the beginning in such a way as to keep time with the other so that when I have the desire to walk purely unrelated physical events in my legs cause them to move at the same time. A variety of this theory is *occasionism*, which says that whenever something happens in the physical world, God affects us so that we *think* we are being affected by the happening.

The trouble about all these theories is (*a*) that they really explain nothing, and (*b*) that they give us a very peculiar view of God as a celestial showman treating us as puppets when it would surely have been easier to create a world in which mind and matter simply interacted by their very nature. Spinoza, too, believed in a sort of psychophysical parallelism in that he did not think that mind and body interacted. But since in his theory everything is God, mind and matter are simply two sides of the same penny.

John Locke, another contemporary, thought of the mind as a blank slate upon which the world writes in the form of sensations, for we have no innate or inborn ideas and mind and matter do interact although he does not tell us how. All we know are sensations—*i.e.*, sense impressions. Bishop Berkeley carried this idea to its logical conclusion: if we know nothing but sensations, we have no reason to suppose that matter exists at all. He was, therefore, an idealist.

18th cent. Views: Hume, Kant. David Hume went further still and pointed out that, if all we know are sensations, we cannot prove the existence of matter but we cannot prove the existence of mind either. All we can ever know is that ideas, impressions, thoughts, follow each other. We do not even experience a self or personality because every time we look into our "minds" all we really experience are thoughts and impressions. Hume was quick to point out that this was not the same as saying that the self did not exist; it only proved that we cannot know that it does.

Kant made it clear that, although there is a world outside ourselves, we can never know

what it is really like. The mind receives impressions and forms them into patterns which conform not to the thing-in-itself but to the nature of mind. Space and time, for example, are not realities but only the form into which our mind fits its sensations. In other words our mind shapes impressions which are no more like the thing-in-itself than the map of a battlefield with pins showing the position of various army groups at any given moment is like the battlefield. This, of course, is true. From physics and physiology we know that the sounds we hear are "really" waves in the air, the sights we see "really" electromagnetic waves. What guarantee do we have that the source is "really" like the impression received in our brain? Kant was the leader of the great German Idealist movement of the 18th cent. which in effect said: "why bother about matter when all we can ever know is mental?'

19th and 20th cent. Views. The Englishman Bradley, and the Frenchman Henri Bergson in the 19th and early 20th cent. both held in one form or another the belief that mind in some way creates matter and were, therefore, idealists, whereas Comte, the positivist (*q.v.*), and the Americans William James and John Dewey, held that mind is a form of behaviour. Certain acts (*e.g.*, reflexes) are "mindless" because they are deliberate; others which are intended may be described for the sake of convenience as "minded" (*i.e.*, purposeful). But like the majority of modern psychologists—insofar as they take any interest in the subject—they regarded mind as a process going on in the living body. Is there any reason, many now ask why we should think of mind as being any different in nature from digestion? Both are processes going on in the body, the one in the brain the other in the stomach and intestines. Why should we regard them as "things"?

See also **J43–4** and **Section Q.**

Mithraism, a sun-religion which originated in Persia with the worship of the mythical Mithra, the god of light and of truth. It was for two centuries one of early Christianity's most formidable rivals, particularly in the West since the more philosophical Hellenic Christianity of the East had little to fear from it. (Arnold Toynbee has described Mithraism as "a pre-Zoroastrian Iranian paganism—in a Hellenic dress"; Manichaeism as "Zoroastrianism—in a Christian dress".) Mithraism was a mystery-faith with secret rites known only to devotees. It appealed to the soldiers of the Roman Army which explains its spread to the farthest limits of the Roman empire and its decline as the Romans retreated. The religion resembled Zoroastrianism (*q.v.*) in that it laid stress on the constant struggle between good and evil and there are a number of parallels with Christianity, *e.g.*, a miraculous birth, death, and a glorious resurrection, a belief in heaven and hell and the immortality of the soul, a last judgment. Both religions held Sunday as the holy day of the week, celebrated 25 December (date of the pagan winter solstice festival) as the birthday of the founder; both celebrated Easter, and in their ceremonies made use of bell, holy water, and the candle. Mithraism reached its height about 275 A.D. and afterwards declined both for the reason given above and, perhaps, because it excluded women, was emotional rather than philosophical, and had no general organisation to direct its course. Yet even today, from the Euphrates to the Tyne, traces of the religion remain and antiquarians are familiar with the image of the sun-god and the inscription *Deo Soli Mithrae, Invicto, Seculari* (dedicated to the sun-god of Mithra, the unconquered). Mithraism enjoyed a brief revival of popular interest in the mid-1950s when workers excavating the foundations of the skyscraper, Bucklersbury House in the City of London, found the well-preserved remains of a Roman Mithraic temple. A campaign to save the temple as a national monument resulted in its now being on open display on a site in front of the skyscraper.

Mohammedanism. See Islam.

Monasticism. When in the 4th cent. A.D. Constantine in effect united state and church there were naturally many who hastened to become Christians for the worldly benefits they expected it to bring in view of the new situation. But there were others who, in their efforts to escape from worldly involvement, went into the deserts of North Africa and Syria to live as hermits and so in these regions there grew up large communities of monks whose lives of renunciation made a considerable impression on the Christian world. They were men of all types but the two main groups were those who preferred to live alone and those who preferred a community life. Among the first must be included St. Anthony, the earliest of the hermits, who was born in Egypt *c.* 250 and who lived alone in a hut near his home for fifteen years, and then in the desert for a further twenty. As his fame spread Anthony came forth to teach and advocate a life of extreme austerity, until by the end of his life the Thebaid (the desert around Thebes) was full of hermits following his example. (Not unnaturally, he was constantly assailed by lustful visions which he thoughtfully attributed to Satan.) In the Syrian desert St. Simeon Stylites and others were stimulated to even greater austerities and Simeon himself spent many years on the top of a pillar in a space so small that it was only possible to sit or stand. With some of these men it is obvious that ascetic discipline had become perverted into an unpleasant form of exhibitionism.

The first monastery was founded by Pachomius of Egypt *c.* 315 and here the monks had a common life with communal meals, worship, and work mainly of an agricultural type. In the Eastern part of the Empire St. Basil (*c.* 360) tried to check the growth of the extreme and spectacular practices of the hermits by organising monasteries in which the ascetic disciplines of fasting, meditation, and prayer, would be balanced by useful and healthy activities. His monasteries had orphanages and schools for boys—not only those who were intended for a monkish life. But the Eastern Church in general continued to favour the hermit life and ascetic extremes. Originally a spontaneous movement, the monastic life was introduced to the West by St. Athanasius in 339 who obtained its recognition from the Church of Rome and St. Augustine introduced it into North Africa beyond Egypt. The movement was promoted also by St. Jerome, St. Martin of Tours, who introduced it into France, and St. Patrick into Ireland. The monastery of Iona was founded by St. Columba in 566. But it must be remembered that the Celtic Church had a life of its own which owed more to the Egyptian tradition than to Rome. Unlike the more elaborate monasteries of the continent those of the early Celtic Church were often little more than a cluster of stone bee-hive nuts, an oratory, and a stone cross. It had its own religious ceremonies and its own art (notably its beautifully carved crosses and the illuminated manuscripts such as the Lindisfarne Gospel (*c.* 700) and the Irish Book of Kells dating from about the same time). The Scottish St. Ninian played a major part in introducing Egyptian texts and art to Britain where, mixed with Byzantine influences and the art of the Vikings, it produced a typical culture of its own. Strangely enough, it was the relatively primitive Celts who played almost as large a part in preserving civilisation in Europe during the Dark Ages as did the Italians since. It was St. Columbanus (*c.* 540–615) who founded the great monasteries of Annegray, Luxeuil, and Fontaine in the Vosges country, St. Gall in Switzerland, and Bobbio in the Apennines. So, too, it was the Anglo-Saxon Alcuin (*c.* 735–804) who was called from York by Charlemagne to set up a system of education throughout his empire; the most famous of the monastic schools he founded was at Tours. Among those influenced by him was the philosopher John Scotus Erigena.

Meanwhile from the south, as the disintegrating Roman empire became increasingly corrupt, St. Benedict of Nursia (*c.* 480–*c.* 543) fled the pleasures of Rome to lead a hermit's life near Subiaco. Here he founded some small monasteries, but *c.* 520 made a new settlement, the great monastery of Monte Cassino in southern Italy, where he established a "Rule" for the government of monks. This included both study and work and emphasised that education

was necessary for the continuance of Christianity. As his influence spread his Rule was adopted by other monasteries, and schools became part of monastic life. It is not possible to describe the many different orders of monks and nuns formed since, nor the mendicant orders of friars (*e.g.*, Franciscans, Dominicans, Carmelites, Augustinians). In many ways even those outside the Roman Catholic Church owe much to the monastic movement. Monasticism, of course, is not peculiar to Christianity and forms a major aspect of Buddhism, especially in the form of Lamaism in Tibet (*q.v.*)

Montanism, a Phrygian form of primitive Puritanism with many peculiar tenets into which the early Christian theologian Tertullian (*c.* 150–*c.* 230) was driven by his extremist views that the Christian should keep himself aloof from the world and hold no social intercourse whatever with pagans. The sect had immediate expectation of Christ's second coming and indulged in prophetic utterance which they held to be inspired by the Holy Ghost but which their enemies put down to prompting by the Devil. In seeking persecution and martyrdom they antagonised the Church and were suppressed.

Moral Re-Armament, a campaign launched in 1938 by an American evangelist of Lutheran background, Frank N. D. Buchman (1878–1961), founder of the Oxford Group Movement, and at first associated with the First Century Church Fellowship, a fundamentalist Protestant revivalist movement. On a visit to England in 1920 Buchman preached "world-changing through life-changing" to undergraduates at Oxford, hence the name Oxford Group. This revivalist movement was based on Buchman's conviction that world civilisation was breaking down and a change had to be effected in the minds of men.

Two of the Group's most typical practices were group confession of sins openly and the "quiet time" set aside during the day to receive messages from the Almighty as to behaviour and current problems. In the eyes of non-Groupers the confession (often of trivial sins) appeared to be exhibitionist and there was felt to be a certain snobbery about the movement which made it strongly conscious of the social status of its converts.

The Oxford Group gave way to Moral Re-Armament, the third phase of Buchmanism. M.R.A. men and women lay stress on the four moral absolutes of honesty, purity, love, and unselfishness. They believe they have the ideas to set the pattern for the changing world and, indeed, claim to have aided in solving many international disputes—political, industrial, and racial. Theologians complained of the Groups that their movement lacked doctrine and intellectual content; M.R.A. is no different in this respect.

The peak of public interest in M.R.A. was probably reached in the 1950s. Like so many movements of its kind it relied heavily for its motive force on the dynamism of its founder and leader. With the death of Dr. Buchman and the unexpected demise at an early age of his most promising protégé and successor-designate, the journalist Peter Howard, the movement began to lose its public impact.

Moravian Church, a revival of the Church of the "Bohemian Brethren" which originated (1457) among some of the followers of John Hus. It developed a kind of Quakerism that rejected the use of force, refused to take oaths, and had no hierarchy. It appears to have been sympathetic towards Calvinism but made unsuccessful approaches to Luther. As a Protestant sect it was ruthlessly persecuted by Ferdinand II and barely managed to survive. However, in the 18th cent. the body was re-established by Count Zinzendorf who offered it a place of safety in Saxony where a town called Herrnhut (God's protection) was built and this became the centre from which Moravian doctrine was spread by missionaries all over the world. Their chief belief (which had a fundamental influence on John Wesley—*see* Methodism) was that faith is a direct illumination from God which assures us beyond all possibility of doubt that we are saved, and that no goodness of behaviour, piety, or orthodoxy is of any use without this "sufficient, sovereign, saving grace."

Mormons, or **Latter-day Saints**, one of the very numerous American religious sects; founded in 1830 by Joseph Smith, the son of a Vermont farmer, who, as a youth, had been influenced by a local religious revival though confused by the conflicting beliefs of the various denominations. He said that while praying for guidance he had been confronted by two heavenly messengers who forbade him to join any existing church but prepare to become the prophet of a new one. Soon, in a series of visions, he was told of a revelation written on golden plates concealed in a nearby hillside. These he unearthed in 1827 and with the help of "Urim and Thummim" translated the "reformed Egyptian" characters into English. Described as the *Book of Mormon*, this was published in 1830 and at the same time a little church of those few who accepted his testimony was founded in Fayette, N.Y. In addition the first of Joseph Smith's "miracles"—the casting out of a devil—was performed. The *Book of Mormon* purports to be a record of early American history and religion, the American Indians being identified as the ten Lost Tribes of Israel, whose fate has never failed to attract the attention of those who prefer myth to fact (cf. British Israelites). Jesus Christ is alleged to have appeared in America after His ascension. Yet Smith's eloquence was able to influence quite educated people, including Sidney Rigdon with whom he went into business for a time. *Doctrine and Covenants* is the title of another book dealing with the revelations Smith claimed to have received. Soon the sect was in trouble with the community both because its members insisted on describing themselves as the Chosen People and others as Gentiles and because they took part in politics, voting as Smith ordered them to. Smith was constantly in trouble with the police. Therefore they were turned out from one city after another until they found themselves a dwelling-place at Nauvoo, Illinois, on the Mississippi.

That would probably have been the end of the story had not Smith been murdered in 1844 and thereby made to appear a martyr, and had there not appeared Brigham Young, a quite extraordinary leader, who stamped out warring factions and drove out the recalcitrant. While persecutions continued Brigham Young announced that it had been revealed that he must lead the faithful to Salt Lake, then outside the area of the United States. There followed the famous trek of more than a thousand miles across desert country in which he led the way, reaching his journey's end in the forbidding valley of the Great Salt Lake on 24 July 1847. By 1851 30,000 Mormons had reached the Promised Land. Here they held their own in a hostile environment and under the practical genius of their leader carried through a vast irrigation scheme and built Salt Lake City which still serves as the headquarters of their sect. In 1850 their pioneer settlement was made Utah Territory, and in 1896 incorporated in the Union. The church was strictly ruled by its leader who also looked after affairs of state for thirty years until his death in 1877.

Polygamy, although opposed by some Mormons, and only sanctioned by Brigham Young when Salt Lake City had been built, is the best-known of Mormon doctrines. It brought the sect into much disrepute and was renounced in 1890. Mormons are millenarians, believing that some time Christ will appear and rule for a thousand years.

There are two orders of priests or leaders: the Melchizedeks, or higher order, include the apostles or ruling elders, and the high priest; the Aaronic priesthood, or lower order, attends to the temporal affairs of the church as the Melchizedeks attend to the spiritual. Members abstain from alcohol, tobacco, coffee, and tea. The church lays stress on the importance of revelation through visions, on education to meet the social, spiritual, and cultural needs of its members, and on community welfare. Members of the Church of Jesus Christ of Latter-day Saints now number over two million in congregations throughout the world.

The Reorganised Church of Jesus Christ of Latter-day Saints with its headquarters at Independence, Missouri, has been separate and distinct since 1852.

Muggletonians, one of the many sects which arose during the Commonwealth but, unlike most of the others (**Levellers** (*q.v.*), **Diggers** (*q.v.*, Fifth-Monarchy Men, and the Millenarians) which tended to have a strongly political aspect, this was purely religious. Founded by two journeymen tailors, Lodowick Muggleton and John Reeve, who interpreted the Book of Revelation in their own peculiar way, it was decided that Reeve represented Moses, and Muggleton, Aaron. They also believed that the Father, not the Son, had died on the cross (an ancient heresy) but added the strange statement that He left Elijah in control during His period on earth. Rejecting the doctrine of the Trinity, they also asserted that God has a human body. Nevertheless, for a time, they had a large number of followers.

Mysticism, a religious attitude which concerns itself with direct relationship with God, "reality" as contrasted with appearance or the "ultimate" in one form or another. All the higher religions have had their mystics who have not always been regarded without suspicion by their more orthodox members, and, as Bertrand Russell points out, there has been a remarkable unity of opinion among mystics which almost transcends their religious differences. Thus, characteristic of the mystical experience in general, have been the following features: (1) a belief in insight as opposed to analytical knowledge which is accompanied in the actual experience by the sense of a mystery unveiled, a hidden wisdom become certain beyond the possibility of doubt; this is often preceded by a period of utter hopelessness and isolation described as "the dark night of the soul"; (2) a belief in unity and a refusal to admit opposition or division anywhere; this sometimes appears in the form of what seem to be contradictory statements: "the way up and the way down is one and the same" (Heraclitus). There is no distinction between subject and object, the act of perception and the thing perceived; (3) a denial of the reality of time, since if all is one the distinction of past and future must be illusory; (4) a denial of the reality of evil (which does not maintain, *e.g.*, that cruelty is good but that it does not exist in the world of reality as opposed to the world of phantoms from which we are liberated by the insight of the vision). Among the great mystics have been Meister Eckhart and Jakob Boehme, the German religious mystics of the 13th and 16th cent. respectively, Acharya Sankara of India, and St. Theresa and St. John of the Cross of Spain. Mystical movements within the great religions have been: the Zen (*q.v.*) movement within Buddhism; Taoism in China; the Cabalists and Hasidim in Judaism; the Sufis within Islam; some of the Quakers within Christianity.

Mystery Religions. *See* **Orphism.**

N

Natural Law, the specifically Roman Catholic doctrine that there is a natural moral law, irrespective of time and place, which man can know through his own reason. Originally a product of early rational philosophy, the Christian form of the doctrine is basically due to St. Thomas Aquinas who defined natural law in relation to eternal law, holding that the eternal law is God's reason which governs the relations of all things in the universe to each other. The natural law is that part of the eternal law which relates to man's behaviour. Catholic natural law assumes that the human reason is capable of deriving ultimate rules for right behaviour since there are in man and his institutions certain stable structures produced by God's reason which man's reason can know to be correct and true. Thus, the basis of marriage, property, the state, and the contents of justice are held to be available to man's natural reason. The rules of positive morality and civil law are held to be valid only insofar as they conform to the natural law, which man is not only capable of knowing but also of obeying.

Protestant theologians criticise this notion. Thus Karl Barth and many others hold that sinful and fallen man cannot have any direct knowledge of God or His reason or will without the aid of revelation. Another theologian Niebuhr points out that the principles of the doctrines are too inflexible and that although they are the product of a particular time and circumstance, they are regarded as if they were absolute and eternal. In fact, as most social scientists would also agree, there is no law which can be regarded as "natural" for all men at all times. Nor does it seem sensible to suppose that all or even many men possess either the reason to discern natural law or the ability to obey it; whether or not we accept man's free-will (and all Protestant sects do not), we know as a fact of science that people are not always fully responsible for their actions and some not at all.

Nazism, the term commonly used for the political and social ideology of the German National Socialist Party inspired and led by Hitler. The term *Nazi* was an abbreviation of National Socialist. Those in the Federal Republic today sympathetic to National Socialist aims are known as neo-Nazis. *See* **Fascism.**

Neoplatonism. *See* **Determinism and Free-will** and **God** and **Man.**

Nihilism, the name commonly given to the earliest Russian form of revolutionary anarchism. It originated in the early years of Tsar Alexander II (1818–81), the liberator of the serfs, who, during his attempts to bring about a constitutional monarchy, was killed by a bomb. The term "nihilist," however, was first used in 1862 by Turgenev in his novel *Fathers and Children*. *See* **Anarchism.**

Nominalism. Early mediaeval thinkers were divided into two schools, those who regarded "universals" or abstract concepts as mere names without any corresponding realities (Nominalists), and those who held the opposite doctrine (**Realism**) that general concepts have an existence independent of individual things. The relation between universals and particulars was a subject of philosophical dispute all through the Middle Ages.

The first person to hold the nominalist doctrine was probably Roscelin or Roscellinus in the late 11th cent., but very little is known of him and none of his works remains except for a single letter to Peter Abelard who was his pupil. Roscelin was born in France, accused twice of heresy but recanted and fled to England where he attacked the views of Anselm, according to whom Roscelin used the phrase that universals were a *flatus voci* or breath of the voice. The most important nominalist was the Englishman William of Occam in the 13th cent. who, once and for all, separated the two schools by saying in effect that science is about things (the nominalist view), whereas logic, philosophy, and religion are about terms or concepts (the Platonic tradition). Both are justified, but we must distinguish between them. The proposition "man is a species" is not a proposition of logic or philosophy but a scientific statement since we cannot say whether it is true or false without knowing about man. If we fail to realise that words are conventional signs and that it is important to decide whether or not they have a meaning and refer to something, then we shall fall into logical fallacies of the type: "Man is a species, Socrates is a man, therefore Socrates is a species." This, in effect, is the beginning of the modern philosophy of logical analysis which, to oversimplify, tells us that a statement is not just true or untrue, it may also be meaningless. Therefore, in all the philosophical problems we have discussed elsewhere, there is the third possibility that the problem we are discussing has no meaning because the words refer to nothing and we must ask ourselves before going any further "what do we mean by God," has the word "free-will" any definite meaning?

Nonconformism, the attitude of all those Christian bodies which do not conform to the doctrines of the Church of England. Up to the passing of the Act of Uniformity in 1662 they were called

"puritans" or "dissenters" and were often persecuted. The oldest bodies of nonconformists are the Baptists, Independents, and (in England) the Presbyterians; the Methodists, although dating from 1738, did not consider themselves nonconformists until some time later. The Presbyterians are, of course, the official Church of Scotland where it is the Anglicans (known as "Episcopalians") who are the nonconformists, although not generally described as such.

O

Objectivism, a semi-political philosophy expounded by the American novelist, Ayn Rand, and interesting in as much as it was first propagated through two of her own best-selling novels. The thesis of Objectivism is the inherent suitability of the competitive capitalist system for the well-being and advancement of the human race. The seeds of man's destruction, Miss Rand believes, are to be found in the creeping menace of socialism, which by its tendency to encourage the individual to rely on the state rather than himself, undermines the dynamic power of human hard work and self-interest. In her first, and perhaps most significant novel, *The Fountainhead*, she tells the story of an unconventional and highly self-motivated architect, Howard Roark, who achieves world fame and success by a combination of hard work, talent, and refusal to compromise. Her second major novel, *Atlas Shrugged*, which is over 1100 pages long, pictures a world in which the "objectivists" (the hard-working, self-motivated, highly talented individuals in the human race) decide to pull out from society and set up a secret nation of their own. Left to its own devices, the world of socialist slackers and loafers slides into grey destruction. Objectivism seems to have arisen as a kind of counterblast to the growing tendency within some sections of the United States to decry capitalism as impersonal profiteering, and followers sport as their insignia a small badge depicting the dollar sign—the emblem incidentally of the secret states in *Atlas Shrugged*. The movement, which relies heavily on the talent and personality of its founder, has made little headway into formal American politics, but Miss Rand's books, which have sold literally by the millions, obviously touch a chord in many readers' minds.

Occam's Razor, the philosophical maxim by which William of Occam, the 13th cent. nominalist (*q.v.*), has become best-known. This states in the form which is most familiar: "Entities are not to be multiplied without necessity" and as such does not appear in his works. He did, however, say something much to the same effect: "It is vain to do with more what can be done with fewer." In other words, if everything in some science can be interpreted without assuming this or that hypothetical entity, there is no ground for assuming it. This is Bertrand Russell's version, and he adds: "I have myself found this a most fruitful principle in logical analysis."

Occultism. *See* **Magic, Alchemy, Astrology, and Theosophy.**

Orangemen, members of an Irish society formed in Ulster in 1795 to uphold Protestantism. Their name is taken from King William III, Prince of Orange, who defeated James II at the Battle of the Boyne (1690), hence the enormous banners depicting "King Billy on the Boyne" carried in procession on 12 July each year. The Unionist Party of Northern Ireland (the ruling political party from 1921 to 1972) is largely maintained by the Orange Order. The Order has branches in many English-speaking countries but flourishes chiefly in Ulster.

Orgonomy, a pseudo-psychological theory advanced by the German psychiatrist Wilhelm Reich (1897–1957), a pupil of Freud, who was expelled from Germany for attacking the Nazis and who started life afresh in the U.S.A. like so many of his colleagues. Moving quickly away from orthodox psychoanalytic theories, Reich became increasingly obsessed with the view that all living things were permeated with a unique force or energy which he termed "orgone" and which he believed could be photographed and measured with a geiger counter. The key to the successful flow of orgone throughout the body was sexual intercourse and the resulting orgasm (hence "orgone"). Reich achieved a substantial following for his increasingly bizarre views and when he was sentenced to two-years' imprisonment in 1956 for alleged medical malpractice a "civil rights" controversy developed which has not died down to this date. His unfortunate and rather tragic death in prison has fanned the emotional issues and granted him the important role of martyr to his cause. There is presently a strong revival of interest in Reich and orgonomy, partly in tune with the general occult revival. A recent witty, but not totally unsympathetic film about his work "W R—Mysteries of the Organism" has drawn the attention of a large new audience to his teachings.

Orphism. The Greeks in general thought very little of their gods, regarding them as similar to human beings with human failings and virtues although on a larger scale. But there was another aspect of Greek religion which was passionate, ecstatic, and secret, dealing with the worship of various figures among whom were Bacchus or Dionysus, Orpheus, and Demeter and Persephone of the Eleusinian Mysteries. Dionysus (or Bacchus) was originally a god from Thrace where the people were primitive farmers naturally interested in fertility cults. Dionysus was the god of fertility who only later came to be associated with wine and the divine madness it produces. He assumed the form of a man or a bull and his worship by the time it arrived in Greece became associated with women (as was the case in most of the Mystery Religions) who spent nights on the hills dancing and possibly drinking wine in order to stimulate ecstasy; an unpleasant aspect of the cult was the tearing to pieces of wild animals whose flesh was eaten raw. Although the cult was disapproved of by the orthodox and, needless to say, by husbands, it existed for a long time.

This primitive and savage religion in time was modified by that attributed to Orpheus whose cult was more spiritualised, ascetic, and substituted mental for physical intoxication. Orpheus may have been a real person or a legendary hero and he, too, is supposed to have come from Thrace, but his name indicates that he, or the movement associated with him, came from Crete and originally from Egypt which seems to have been the source of many of its doctrines. Crete, it must be remembered, was the island through which Egypt influenced Greece in other respects. Orpheus is said to have been a reformer who was torn to pieces by the Maenad worshippers of Dionysus. The Orphics believed in the transmigration of souls and that the soul after death might obtain either eternal bliss or temporary or permanent torment according to its way of life upon earth. They held ceremonies of purification and the more orthodox abstained from animal food except on special occasions when it was eaten ritually. Man is partly earthly, partly heavenly, and a good life increases the heavenly part so that, in the end, he may become one with Bacchus and be called a "Bacchus."

The religion had an elaborate theology. As the Bacchic rites were reformed by Orpheus, so the Orphic rites were reformed by Pythagoras (*c.* 582–*c.* 507 B.C.) who introduced the mystical element into Greek philosophy which reached its heights in Plato. Other elements entered Greek life from Orphism. One of these was feminism which was notably lacking in Greek civilisation outside the Mystery Religions. The other was the drama which arose from the rites of Dionysus. The mysteries of Eleusis formed the most sacred part of the Athenian state religion, and it is clear that they had to do with fertility rites also, for they were in honour of Demeter and Persephone and all the myths speak of them as being associated with the supply of corn to the country. Without being provocative, it is accepted by most anthropologists and many theologians that Christianity, just as it accepted elements of Gnosticism and Mithraism, accepted elements from the Mystery

Religions as they in turn must have done from earlier cults. The miraculous birth, the death and resurrection, the sacramental feast of bread and wine, symbolising the eating of the flesh and drinking of the blood of the god, all these are common elements in early religions and not just in one. None of this means that what we are told about Jesus is not true, but it surely does mean: (*a*) that Christianity was not a sudden development; (*b*) that the early Church absorbed many of the elements of other religions; (*c*) that perhaps Jesus Himself made use of certain symbols which He knew had a timeless significance for man and invested them with new meaning.

Orthodox Eastern Church. There are two groups of Eastern churches: (1) those forming the Orthodox Church dealt with here which include the ancient Byzantine patriarchates of Constantinople, Alexandria, Antioch, and Jerusalem, and the national churches of Russia, Greece, Yugoslavia, Bulgaria, Rumania, etc. (although Orthodox communities exist all over the world and are no longer confined to geographical areas); (2) the churches which rejected Byzantine orthodoxy during various controversies from the 5th to the 7th cent., notably the Coptic church (*q.v.*) and the Armenian church. Although all Orthodox churches share the same doctrine and traditions they are arranged as national independent bodies each with its own hierarchy. They do not recognise the pope, and the primacy of the patriarch of Constantinople is largely an honorary one. Although claiming to be the One Holy, Catholic, and Apostolic Church its alleged infallibility rests on universal agreement rather than on any one individual, and agreement over the faith comes from the Scriptures interpreted in the light of the Tradition. The latter includes dogmas relating to the Trinity, Christology, Mariology, and Holy Icons; the testimony of the Fathers (St. Athanasius, St. Basil, St. John Chrysostom, St. Cyril of Alexandria, etc.); the canons or rules as formulated by the Councils and the Fathers. The Orthodox Church did not take part in the great Western controversies about the Bible, nor, of course, in the Reformation. Attempts have recently been made to improve relations between Rome and Constantinople: the two Churches agreed in 1965 to retract the excommunications cast on each other in A.D. 1054, which formalised the Great Schism.

Ouspensky, a contemporary of Gurdjieff (*q.v.*), Peter Ouspensky was another obscure mystic of Eastern European origin who believed he had an occult philosophical message to bring to the West. This he embodied in a series of lengthy books which are both humourless and self-indulgent. Although in his lifetime he attracted a small cultish following, his effective impact on academic philosophy has been almost zero.

Pantheism. *See* **God and Man.**

Papal Infallibility. The basis of papal infallibility is (*a*) that every question of morals and faith is not dealt with in the Bible so it is necessary that there should be a sure court of appeal in case of doubt, and this was provided by Christ when he established the Church as His Teaching Authority upon earth; (*b*) ultimately this idea of the teaching function of the Church shapes the idea of papal infallibility which asserts that the pope, when speaking officially on matters of faith or morals, is protected by God against the possibility of error. The doctrine was proclaimed in July 1870.

Infallibility is a strictly limited gift which does not mean that the pope has extraordinary intelligence, that God helps him to find the answer to every conceivable question, or that Catholics have to accept the pope's views on politics. He can make mistakes or fall into sin, his scientific or historical opinions may be quite wrong, he may write books that are full of errors. Only in two limited spheres is he infallible and in these only when he speaks officially as the supreme teacher and lawgiver of the Church, defining a doctrine that must be accepted by all its members. When, after studying a problem of faith or morals as carefully as possible, and with all available help from expert consultants, he emerges with the Church's answer—on these occasions it is not strictly an answer, it is *the* answer.

Historically speaking, the Roman Catholic Church of the early 19th cent. was at its lowest ebb of power. Pope Pius IX, in fear of Italian nationalism, revealed his reactionary attitude by the feverish declaration of new dogmas, the canonisation of new saints, the denunciation of all modern ideals in the Syllabus of Errors, and the unqualified defence of his temporal power against the threat of Garibaldi. It is not too much to say that everything regarded as important by freedom-loving and democratic people was opposed by the papacy at that time. In 1870, after a long and sordid struggle, the Vatican Council, convened by Pius IX, pronounced the definition of his infallibility. Döllinger, a German priest and famous historian of the Church, was excommunicated because, like many others, he refused to accept the new dogma. It is difficult not to doubt that there was some connection between the pronouncement of the pope's infallibility and his simultaneous loss of temporal power.

After the humanism of the Second Vatican Council (1962–5) the Pope's encyclical *Humanae Vitae* (1968), condemning birth control, came as a great disappointment to the many people (including theologians, priests, and laymen) who had expected there would be a change in the Church's teaching. The Church's moral guidance on this controversial issue, however, does not involve the doctrine of infallibility. (The Roman Catholic Church teaches that papal pronouncements are infallible only when they are specifically defined as such.) That there is unlikely to be any immediate softening of the Church's line on infallibility was made clear in July 1973 when the Vatican's Sacred Congregation for the Doctrine of the Faith published a document strongly reaffirming papal infallibility. The document also reminded Catholics of their obligation to accept the Catholic Church's unique claims to authenticity.

Parapsychology, the name given to the study of psychical research (*q.v.*) as an academic discipline, and chosen to denote the topic's supposed status as a branch of psychology. The impetus behind parapsychology came from the psychologist William MacDougall who persuaded Duke University in North Carolina, U.S.A., to found a department of parapsychology under J. B. Rhine. Throughout the 1930s and 40s the work of Rhine and his colleagues, who claimed to have produced scientific evidence for the existence of E.S.P., attracted world-wide attention. Increasing reservations about the interpretation of Rhine's results and an apparent lack of any readily repeatable experiments, however, gradually eroded scientific confidence in the topic. The academic status of parapsychology is at the present time exceedingly uncertain. Rhine retired from university life in 1965 and the world-famous parapsychology laboratory at Duke University was closed. On the other hand the American Association for the Advancement of Science recently admitted the Parapsychology Association (the leading organisation for professional parapsychologists) as an affiliated member society. An American government body, the National Institute of Mental Health, has also officially supported some medical research into alleged telepathic dreams, the first "official" grant support of this kind. In Britain a recent poll of readers in the weekly journal, *New Scientist*, revealed a very high interest in the subject matter of parapsychology, though no British university actively supports research into the topic. Stories of intensive parapsychological research in Soviet Russia are however without foundation and are not supported by Western parapsychologists who have visited Russia.

Parsees. *See* **Zoroastrianism.**

Pavlovian theory. *See* Behaviourism.

Phrenology, a psychological "school" founded in 1800 by two Germans, Franz Josef Gall and Johann Gaspar Spurzheim. Gall was an anatomist who believed there to be some correspondence between mental faculties and the shape of the head. He tested these ideas in prisons and mental hospitals and began to lecture on his findings, arousing a great deal of interest throughout both Europe and America, where his doctrines were widely accepted. Phrenology became fashionable, and people would go to "have their bumps read" as later men and women of fashion have gone to be psychoanalysed. Roughly speaking, Gall divided the mind into thirty-seven faculties such as destructiveness, suavity, self-esteem, conscientiousness, and so on, and claimed that each of these was located in a definite area of the brain. He further claimed that the areas in the brain corresponded to "bumps" on the skull which could be read by the expert, thus giving a complete account of the character of the subject. In fact, (*a*) no such faculties are located in the brain anywhere for this is simply not the way the brain works; (*b*) the faculties described by Gall are not pure traits which cannot be further analysed and are based on a long outdated psychology; (*c*) the shape of the brain bears no specific relationship to the shape of the skull. Phrenology is a pseudo-science; there is no truth in it whatever. But, even so, like astrology, it still has its practitioners.

Physiocrats. A French school of economic thought during the 18th cent., known at the time as *Les Economistes* but in later years named physiocrats by Du Pont de Nemours, a member of the School. Other members were Quesnay, Mirabeau, and the great financier Turgot. The physiocrats held the view, common to the 18th cent., and deriving ultimately from Rousseau, of the goodness and bounty of nature and the goodness of man "as he came from the bosom of nature." The aim of governments, therefore, should be to conform to nature; and so long as men do not interfere with each other's liberty and do not combine among themselves, governments should leave them free to find their own salvation. Criminals, madmen, and monopolists should be eliminated. Otherwise the duty of government is *laissez-faire, laissez passer*. From this follows the doctrine of free trade between nations on grounds of both justice and economy; for the greater the competition, the more will each one strive to economise the cost of his labour to the general advantage. Adam Smith, although not sharing their confidence in human nature, learned much from the physiocrats, eliminated their errors, and greatly developed their teaching.

Physiognomy. *See* Characterology.

Pietism, a movement in the Lutheran Church at the end of the 17th cent.—the reaction, after the sufferings of the thirty years' war, of a pious and humiliated people against learning, pomp and ceremony, and stressing the importance of man's personal relationship with God. The writings of Johann Georg Hamann (1730–88) who came from a Pietist family of Königsberg influenced Kierkegaard. The Pietist movement was the root of the great Romantic movement of the 18th cent.

Plymouth Brethren, a religious sect founded by John Nelson Darby, a minister of the Protestant Church of Ireland, and Edward Cronin, a former Roman Catholic, in 1827. Both were dissatisfied with the lack of spirituality in their own and other churches and joined together in small meetings in Dublin every Sunday for "the breaking of bread." Soon the movement began to spread through Darby's travels and writings and he finally settled in Plymouth, giving the popular name to the "Brethren." Beginning as a movement open to all who felt the need to "keep the unity of the Spirit," it soon exercised the right to exclude all who had unorthodox views and split up into smaller groups. Among these the main ones were the "Exclusives," the Kellyites, the Newtonites, and "Bethesda" whose main differences were over problems of church government or prophetical powers. Some of these are further split among themselves. Readers of *Father and Son* by Sir Edmund Gosse, which describes life with his father, the eminent naturalist Philip Gosse, who belonged to the Brethren, will recall how this basically kind, honest, and learned man was led through their teachings to acts of unkindness (*e.g.*, in refusing to allow his son and other members of his household to celebrate Christmas and throwing out the small tokens they had secretly bought), and intellectual dishonesty (*e.g.*, in refusing for religious reasons alone to accept Darwinism when all his evidence pointed towards it).

The original views of Darby which were perpetuated by the "Exclusive" Brethren were somewhat as follows: Christianity has fallen from New Testament purity and all Christendom and every Church is corrupt and has incurred God's displeasure, notably by establishing ministerial offices which hinder the believer's approach to God. Ministers should not be officials but possess special gifts ("Charismata") granted from above and assigned by the Holy Ghost according to his will; these Charismata have no connection whatever with any official posts although in some cases they may coincide with them. The whole doctrine of the Brethren is based on the need for *direct* access to God and the rejection of any intermediate agency such as priests, ministers or presbyters. The Exclusive Brethren adopted new harsh rules in 1965 designed to prevent "Saints" (members) from having any contact with "Sinners" (non-members). Members sharing homes with non-members were to be expelled; members must declare their bank balances; unmarried members, single or widowed, must marry as soon as possible within the sect.

Today, the majority of Brethren belong to the "Open Brethren" assemblies and, unlike the "Exclusives," hold that the Lord's Supper (a commemorative act of "breaking the bread" observed once a week) is for all Christians who care to join them. Baptism is required and Brethren believe in the personal premillenial second coming of Christ.

Poltergeist, allegedly a noisy type of spirit which specialises in throwing things about, making loud thumpings and bangings, and occasionally bringing in "apports," *i.e.*, objects from elsewhere. Most so-called poltergeist activities are plain frauds, but the others are almost invariably associated with the presence in the house of someone (often, but not always a child) who is suffering from severe mental conflicts usually of a sexual nature. The inference is that those activities which are not simply fraudulent are either due to some unknown influence exuded by such mentally abnormal people, or that they are actually carried out by ordinary physical means by such people when in a state of hysterical dissociation—*i.e.*, unconsciously. The second hypothesis is much the more probable. *See* Psychic Research.

Polytheism. *See* God and Man.

Positivism, also known as the Religion of Humanity, was founded by Auguste Comte (1798–1857), a famous mathematician and philosopher born in Montpellier, France. His views up to the end of the century attracted many and it would have been impossible throughout that time to read a book on philosophy or sociology that did not mention them, but today his significance is purely of historical interest. In his *Cours de Philosophie Positive* (1830) he put forward the thesis that mankind had seen three great stages in human thought: (1) the theological, during which man seeks for supernatural causes to explain nature and invents gods and devils; (2) the metaphysical, through which he thinks in terms of philosophical and metaphysical abstractions; (3) the last positive or scientific stage when he will proceed by experiment and objective observation to reach in time "positive truth."

Broadly speaking, there is little to complain of in this analysis; for there does seem to have been some sort of general direction along these lines. However, Comte was not satisfied with having reached this point and felt that his system demanded a religion and, of course, one that was "scientific." This religion was to be the worship of Humanity in place of the personal Deity of earlier times, and for it he supplied not

only a Positive Catechism but a treatise on Sociology in which he declared himself the High Priest of the cult. Since, as it stood, the religion was likely to appear somewhat abstract to many, Comte drew up a list of historical characters whom he regarded as worthy of the same sort of adoration as Catholics accord to their saints. The new Church attracted few members, even among those who had a high regard for Comte's scientific work, and its only significant adherents were a small group of Oxford scholars and some in his own country Frederic Harrison was the best-known English adherent and throughout his life continued to preach Comtist doctrines in London to diminishing audiences.

Pragmatism, a typically American school of philosophy which comes under the heading of what Bertrand Russell describes as a "practical" as opposed to a "theoretical" philosophy. Whereas the latter, to which most of the great philosophical systems belong, seeks disinterested knowledge for its own sake, the former (*a*) regards action as the supreme good, (*b*) considers happiness an effect and knowledge a mere instrument of successful activity.

The originator of pragmatism is usually considered to have been the psychologist William James (1842–1910) although he himself attributed its basic principles to his life-long friend, the American philosopher, Charles Sanders Peirce (1839–1914). The other famous pragmatist is John Dewey, best-known in Europe for his works on education (for although American text-books on philosophy express opinions to the contrary, few educated people in Europe have taken the slightest interest in pragmatism and generally regard it as an eccentricity peculiar to Americans). James in his book *The Will to Believe* (1896) points out that we are often compelled to take a decision where no adequate theoretical grounds for a decision exist; for even to do nothing is to decide. Thus in religion we have a right to adopt a believing attitude although not intellectually fully convinced. We should believe truth and shun error, but the failing of the sceptical philosopher is that he adheres only to the latter rule and thus fails to believe various truths which a less cautious man will accept. If believing truth and avoiding error are equally important, then it is a good idea when we are presented with an alternative to believe one of the possibilities at will, since we then have an even chance of being right, whereas we have none if we suspend judgment. The function of philosophy, according to James, is to find out what difference it makes to the individual if a particular philosophy or world-system is true: "An idea is 'true' so long as to believe it is profitable to our lives," and, he adds, "the true is only the expedient in our way of thinking . . . in the long run and on the whole of course." Thus "if the hypothesis of God works satisfactorily in the widest sense of the word, it is true." Bertrand Russell's reply to this assertion is: "I have always found that the hypothesis of Santa Claus 'works satisfactorily in the widest sense of the word'; therefore 'Santa Claus exists' is true, although Santa Claus does not exist." Russell adds that James's concept of truth simply omits as unimportant the question whether God really *is* in His heaven; if He is a useful hypothesis that is enough. "God the Architect of the Cosmos is forgotten; all that is remembered is belief in God, and its effects upon the creatures inhabiting our petty planet. No wonder the Pope condemned the pragmatic defence of religion."

Predestination. *See* Calvinism.

Presbyterianism, a system of ecclesiastical government of the Protestant churches which look back to John Calvin as their Reformation leader. The ministry consists of presbyters who are all of equal rank. Its doctrinal standards are contained in the *Westminster Confession of Faith* (1647) which is, in general, accepted by English, Scottish, and American Presbyterians as the most thorough and logical statement in existence of the Calvinist creed. The Church of Scotland is the leading Presbyterian church in the British Isles.

The Reformation in Scotland was preceded by the same sort of awareness of the moral corruption of the Roman Church as had happened elsewhere, but for various political and emotional reasons, which need not be discussed here, the majority of the Scottish people (unlike the English who had been satisfied with the mere exchange of Crown for Pope) were determined on a fundamental change of doctrine, discipline, and worship, rather than a reform of manners. The church preachers had learned their Protestantism not from Luther but from Calvin and their leader John Knox had worked in Geneva with Calvin himself and was resolved to introduce the system into Scotland. In 1557 the "Lords of the Congregation" signed the Common Band (*i.e.*, a bond or covenant) to maintain "the blessed Word of God and his congregation" against their enemies, and demanded the right to worship as they had chosen. However, the real date of the Scottish Reformation is August 1560 when Mary of Guise (the regent for Mary Queen of Scots who was not yet of age) died and the Estates met to settle their affairs without foreign pressure; the *Scots Confession* was drawn up and signed by Knox and adopted by the Estates.

The ideas on which the Reformed Kirk was based are found in the *Scots Confession*, the *Book of Discipline*, and the *Book of Common Order*, the so-called Knox's liturgy. Knox's liturgy, the same as that used in Geneva but translated into English, was used until Laud's attempt to force an Anglican liturgy on the Kirk led to an abandonment of both in favour of "free prayers."

The Presbyterian tradition includes uncompromising stress upon the Word of God contained in the Scriptures of the Old and New Testaments as the supreme rule of faith and life, and upon the value of a highly trained ministry, which has given the Church of Scotland a high reputation for scholarship and has in turn influenced the standard of education in Scotland. The unity of the Church is guaranteed by providing for democratic representation in a hierarchy of courts (unlike the Anglican Church, which is a hierarchy of persons). The local kirk-session consists of the minister and popularly elected elders (laymen). Ministers, elected by their flocks, are ordained by presbyters (ministers already ordained). Above the kirk-session is the court of the presbytery which has jurisdiction over a specified area; above that the court of synod which rules over many presbyteries; and finally the General Assembly which is the Supreme Court of the Church with both judicial and legislative powers, and over which the Moderator of the General Assembly presides. The function of the elders is to help the minister in the work and government of the kirk. The episcopacy set up by James VI and I, and maintained by Charles I was brought to an end by the Glasgow Assembly (1638), but General Assemblies were abolished by Oliver Cromwell and at the Restoration Charles II re-established episcopacy. The Covenanters who resisted were hunted down, imprisoned, transported, or executed over a period of nearly thirty years before William of Orange came to the throne and Presbyterianism was re-established (1690). Today Presbyterians no less than other Christian communities are looking at Christianity as a common world religion in the sense that the principles which unite them are greater than those which divide them. A small but significant step in the direction of international Christian unity was made in 1972 when the Presbyterian and Congregationalist Churches in England were merged to form the United Reformed Church. *See* Church of Scotland, Calvinism.

Protestant, the name first applied to those who favoured the cause of Martin Luther and who protested against the intolerant decisions of the Catholic majority at the second Diet of Speyer (1529), revoking earlier decisions of the first Diet of Speyer tolerating the Reformers in certain cases (1526). In general the name "Protestant" is applied to those Churches which severed connection with Rome at the time of the Reformation. The essence of Protestantism is the acceptance by the individual Christian of his direct responsibility to God

rather than to the Church. *See* Lutheranism, Presbyterianism, Calvinism.

Psychedelism. For all his recorded history man has relied upon drugs of one kind or another to make his life more tolerable. These have generally been central nervous system depressants—*i.e.*, alcohol, hashish, etc.—and their use in most societies has been brought under careful government control. Most societies have also at some stage experimented with the use of certain drugs of another class—the hallucinogens. These, far from having the mentally tranquillising characteristics of small doses of alcohol, provoke striking changes in mental alertness, frequently coupled with visionary or hallucinatory experiences. The confusion and disorientation which accompany such states has led to social disapproval of their use in Western countries, and the favoured "legal" drug for centuries has been alcohol. In the 1950s the novelist Aldous Huxley in his essay *The Doors of Perception* wrote of his experiences with the drug mescalin, a derivative of the South American peyotl and a powerful hallucinogen. Huxley put forward the hypothesis that mescalin had given him not only an entirely original psychological experience but had also significantly "heightened" his perceptual ability—a development of the greatest possible interest to artists, writers, and poets. Huxley's book had considerable impact, stimulating other creative individuals into similar experiments, not always with such euphoric results. In England the author Richard Ward reported some frightening moments under the drug LSD in his *A Drug-taker's Notebook* and Huxley amplified the unpredictable nature of the drug-experience in *Heaven and Hell*, published in 1956. Although such experiments were technically illegal, public interest had been considerably aroused and in the 1960s, when it became easy to synthesise the most effective of the hallucinogens, LSD, its use began to be common among certain sections of society. In 1964 a sensational scandal rocked the great American university of Harvard when senior members of the teaching staff, including the psychologist Timothy Leary, were dismissed for using LSD and encouraging students in its use. Unrepentant, Dr. Leary set up a community near New York from whence the cult of psychedelism was propagated.

Psychedelism—which is not really an organised system of belief, but rather an attitude of mind—preaches that through the controlled use of drugs, particularly of the hallucinogenic variety, an individual may be made aware for the first time of the rich fields of experience which lie latent in the unconscious mind. The exploration of these territories will have both a liberating and an enriching effect, the outcome being to "turn on" the individual to the total reality of mind. So convinced do many of the proponents of psychedelia become of the significance of the experience of the so-called LSD "trip," that they are inclined to urge non-trippers to experiment with the drug. Herein, of course, lies one obvious danger, for the drug LSD is potentially a toxic substance which needs to be administered in minute doses if it is not to cause madness or even death. There is also much uncertainty about the possible long-term effects of "tripping," many psychologists and scientists believing that it leads to a progressive disorientation and destruction of the personality, a disintegration of which the individual drug-taker is seldom aware. If there is a credit side to psychedelism it may lie in the clear, if limited, evolution in popular music, art, and design and, to a lesser extent, literature which has been inspired by these excursions. By the beginning of 1970 there was some sign that the wave of interest in LSD and similar drugs was beginning to slacken off, possibly because of an increasing awareness of the possible grievous side-effects and of the largely illusory nature of the "insights" which the "trip" is supposed to provide. Dr Leary, the movement's leading figure, is also reported to be turning his interest elsewhere, notably into the more staid and traditional waters of Maoism (*q.v.*).

Psychic Research, the *scientific* study of so-called psychic phenomena as contrasted with Spiritualism (*q.v.*) which is the cult of those who already believe in their supernatural nature. It is obviously impossible here to summarise work that has been carried out (in Britain notably by the Society for Psychical Research, founded in 1882) on such subjects as mediumship, apparitions, telepathy and clairvoyance (discussed here separately under the heading of Telepathy), poltergeists (also discussed separately), levitation, and precognition.

But the point at which we must begin is the human mind and the nature of scientific evidence and so far as these are concerned the following points may be made.

(1) There is little use in discussing psychic phenomena until we realise that almost no human being—least of all one with strong convictions—is a completely trustworthy witness. A person may be utterly honest in every other respect except that in which his convictions are involved.

(2) This does not mean that a witness is either telling the whole truth or is simply lying; for the following possibilities exist: (*a*) he may be telling the truth: (*b*) he may be consciously lying for motives of his own; (*c*) his recollections may be incorrect in discussing something that happened in the past; (*d*) he may really believe that he saw or heard what he said he did and may be telling the truth *as he experienced it*—*e.g.*, seeing a ghost—without realising that what he experienced is a product of his own unconscious mind; (*e*) there are various degrees of lying, for the mind has a natural tendency to add coherence and meaning to the only partly coherent events of the day, and it is a normal trait (consciously or unconsciously) to make a "good story" out of what originally were isolated and unconnected happenings; (*f*) even under the most favourable conditions the evidence of scientifically-trained people is not as good as it might be (cf. the psychological experiment in which a class of students is suddenly exposed to a deliberately contrived scene, *e.g.*, two men eccentrically dressed rush into the lecture-room, exchange words, and have a quarrel—and the students are afterwards required to write down what they saw and heard, rarely 10 per cent. being even 70 per cent. correct as to what really happened).

(3) There are many aspects of "psychic" phenomena which are not "psychic" at all, but based on well-known scientific principles. How many people, for example, know: (*a*) that *every* physical illness has its psychological aspect, so that a person with chronic arthritis, let us say, may get up and walk for the first time in years after injection with a new drug which is later proved to be worthless or no better than aspirin (*e.g.*, cortisone), yet if a "spiritual healer" got the same results he would be acclaimed for his psychic powers; (*b*) that it is possible to be completely paralysed, totally blind or deaf, have total loss of sensation in some part of the body, have two or more personalities, *without any physical disease being present*, in the neurosis (cured daily by psychiatrists without mystery) known as hysteria.

(4) It is possible under hypnosis, or self-hypnosis, to produce stigmata—*e.g.*, marks resembling the nail-prints of the Crucifixion on hands and feet, to produce blisters at will, spontaneous bleeding, and many of the phenomena usually described as miraculous, in the consulting room and by scientific means.

(5) We all have more potent senses than we ordinarily realise. We may not consciously know the number of steps leading to our flat but can be made under hypnosis to tell. Furthermore, there are people who are hypersensitive in hearing and vision (often without being aware of it), so that in "thought-transference" experiments where they are sent to another room whilst others decide on some object or idea, they may subconsciously hear what is going on; or in card experiments in telepathy they may be able to read the face of the card reflected in the pupils of the "sender" opposite, or tell in a familiar pack which card is which from almost invisible differences on the backs of the cards.

(6) Most of us have no idea of the mathe-

matical laws of probability and are therefore likely to misinterpret the "mysteriousness" of phenomena. Thus, suppose I have a "premonition" that someone has died and later find my feelings confirmed by the event, then I may not remember or know (*a*) that on many previous occasions I, in common with most other people, have had "premonitions" the vast majority of which did *not* come true; (*b*) that, on the last occasion I saw the person, or from things I may have heard, I may have unconsciously noted signs that all was not well and expected the event; (*c*) that the most "improbable" things happen quite normally (*e.g.*, during the last war a flying bomb fell through the roof of the British Museum and failed to explode, and some time later a second flying bomb fell *through the same hole* and likewise *failed to explode*); (*d*) that the chance of a pack of cards being dealt so that each of four persons receives a complete suit is exactly the same as the chance that any other combination of cards may come up.

(7) That collective hallucinosis does occur (it would be invidious to mention in detail certain "miraculous happenings" which might hurt the religious susceptibilities of many, but we are entitled to ask how it is possible for the sun to stand still in the sky in the presence of thousands of people collected in a particular area when it is seen nowhere else in the world and has been noted by no astronomical laboratory?)

(8) Mediums have been proved to be prepared to do the most extraordinary things in order to deceive a suggestible audience seated in semi-darkness—*e.g.*, the so-called "ectoplasm" (a supposedly psychic substance or materialisation) which exudes from the medium's body has been found before the séance, as have "apports" or objects apparently appearing from nowhere, half-way down the medium's throat or in the stomach ready to be regurgitated, and even in other bodily apertures.

It is not maintained that psychic phenomena do not happen, but that we must be extremely cautious in accepting the evidence of our own, or even more, other people's, senses, and much less free in our interpretation of what has been observed really means. *See* Poltergeist, Telepathy, Spiritualism.

Psychoanalysis, an approach to the study of human personality involving the rigorous probing, with the assistance of a specially trained practitioner, of an individual's personal problems, motives, goals and attitudes to life in general. Often, and quite understandably, confused with psychology (of which it is merely a part), psychoanalysis has an interesting historical background and has attracted the interest of philosophers, scientists and medical experts since it emerged as a radical and controversial form of mental therapy at the turn of the century. The traditionally accepted founder is the great Austrian Sigmund Freud, but he never failed to acknowledge the impetus that had been given to his own ideas by his talented friend, the physiologist Joseph Breuer, who for most of his working life had been interested in the curious phenomena associated with hypnosis. Breuer had successfully cured the hysterical paralysis of a young woman patient and had noticed that under hypnosis the girl seemed to be recalling emotional experiences, hitherto forgotten, which bore some relationship to the symptoms of her illness. Developing this with other patients Breuer then found that the mere recalling and discussing of the emotional events under hypnosis seemed to produce a dramatic alleviation of the symptoms—a phenomenon which came to be known as *catharsis*. Breuer also noticed another curious side-effect, that his women patients fell embarrassingly and violently in love with him, and he gradually dropped the practice of "mental catharsis," possibly feeling that it was a bit too dangerous to handle. This left the field clear for Freud, whose brilliant mind began to search beyond the therapeutic aspects of the topic to see what light might be thrown on the nature of human personality and psychological mechanisms in general. The most important question concerned the "forgotten" emotional material which turned up, apparently out of the blue, during the hypnotic session. Freud rightly saw that this posed problems for the current theories of memory, for how could something once forgotten (a) continue to have an effect on the individual without his being aware of it, and (b) ultimately be brought back to conscious memory again. It must be remembered that at this time memory was considered to be a fairly simple process—information was stored in the brain and was gradually eroded or destroyed with the passage of time and the decay of brain cells. Once lost, it was believed, memories were gone for ever, or at best only partially and inaccurately reproducible. Furthermore, human beings were supposed to be rational (if frequently wilful) creatures who never did anything without thinking about it (if only briefly) beforehand and without being well aware of their reasons for so doing. It was within this framework that Freud had his great insight, one which many people believe to be one of the most important ideas given to mankind. This was simply the realisation that the human mind was not a simple entity controlling the brain and body more or less at will, but a complex system made up of a number of integrated parts with at least two major subdivisions—the conscious and the unconscious. The former concerned itself with the normal round of human behaviour, including the larger part of rational thought, conversation, etc., and large areas of memory. The latter was principally devoted to the automatic control of bodily functions, such as respiration, cardiac activity, various types of emotional behaviour not subject to much conscious modification and a large storehouse of relevant "memories" again not normally accessible to the conscious mind. Occasionally, Freud proposed, an exceedingly unpleasant emotional or otherwise painful event might be so troublesome if held in the conscious mind's store, that it would get shoved down into the unconscious or "repressed" where it would cease to trouble the individual in his normal life. The advantages of this mechanism are obvious, but they also brought with them hazards. With certain kinds of memory, particularly those involving psychological rather than physical pain—as for example a severe sexual conflict or marital problem—repression might be used as a device to save the individual from facing his problem in the "real" world, where he might be able ultimately to solve it, by merely hiding it away in the unconscious and thus pretending it did not exist. Unfortunately, Freud believed, conflicts of this kind were not snuffed out when consigned to the basements of the mind, but rather tended to smoulder on, affecting the individual in various ways which he could not understand. Repressed marital conflicts might give rise to impotence, for example, or even to homosexual behaviour. Guilt at improper social actions similarly repressed might provoke nervous tics, local paralysis, etc, etc. Following this line of reasoning, Freud argued that if the unwisely repressed material could be dredged up and the individual forced to face the crisis instead of denying it, then dramatic alleviations of symptoms and full recovery should follow.

To the great psychologist and his growing band of followers the stage seemed to be set for a dramatic breakthrough not only in mental therapy but also in a general understanding of the nature of human personality. To his pleasure—for various reasons he was never too happy about hypnosis—Freud discovered that with due patience, skill and guidance an individual could be led to resurrect the material repressed in his unconscious mind in the normal, as opposed to the hypnotic, state. This technique, involving long sessions consisting of intimate discussions between patient and therapist became known as psychoanalysis, and it has steadily evolved from its experimental beginnings in the medical schools and universities of Vienna to being a major system of psychotherapy with a world-wide following and important theoretical connotations. Psychoanalysis, as practised today, consists of a number of meetings between doctor and patient in which the latter is slowly taught to approach and enter the territory of his subconscious mind, and

examine the strange and "forgotten" material within. A successful analysis, it is claimed, gives the individual greater insight into his own personality and a fuller understanding of the potent unconscious forces which are at work within him and in part dictating his goals.

Freud's initial ideas were of course tentative, and meant to be so. He was however a didactic and forceful personality himself, unwilling to compromise on many points which became controversial as the technique and practice of psychoanalysis developed. The outcome was that some of his early followers, notably the equally brilliant Carl Jung and Alfred Adler, broke away to found their own "schools" or versions of psychoanalysis, with varying degrees of success. Today, psychoanalysis is coming under increasingly critical scrutiny, and its claims are being treated with a good deal of reservation. Notable antagonists include the English psychologist Professor H. J. Eysenck who points out that there is little if any solid experimental data indicating that psychoanalysis is a valid method of treating or curing mental illness. Analysists respond by saying that their system is closer to an art than a craft and not amenable to routine scientific experiment. The controversy will no doubt continue for some time to come, but whatever its validity as therapy, the basic ideas behind psychoanalysis—notably the reality and power of the unconscious mind—are beyond question and have given human beings definite and major insights into the greatest enigma of all—the workings of the human mind. *See also* Section Q.

Psychokinesis (alternatively **Telekinesis**), the supposed faculty of the human mind to influence objects at a distance by "thought" or the act of will. Scientific evidence for the existence of PK (as it is abbreviated) is very slender indeed and people claiming to have witnessed it have probably been the victims of simple trickery or a skilful illusion. Almost 20,000,000 people watched an alleged demonstration of PK on British television in 1973 when a young Israeli, Uri Geller, purported to bend cutlery by mental power. Despite their spectacular appearance, such demonstrations have no scientific validity whatsoever and little can be inferred about the powers of Mr. Geller and other similar claimants unless they have demonstrated their abilities to professional magicians, in order that simple sleight of hand can be ruled out.

Psychometry, the supposed talent or faculty of divining something about the history and previous owners of an object by holding it in the hand. A common feature of modern Spiritualistic practice, and to a certain extent synonymous with clairvoyance, psychometry is based on an ancient magical assumption that objects somehow take on traces or "memories" of their surroundings which are detectable by specially sensitive individuals. Controlled scientific tests on people claiming to have this power have however proved totally negative. *See also* Psychical Research.

Pyramidology, a curious belief that the dimensions of the Great Pyramid at Giza, if studied carefully, reveal principles of fundamental historical and religious significance. The perpetrator of this was a Victorian publisher, John Taylor, who discovered that if you divide the height of the pyramid into twice the side of its base you get a number very similar to pi—a number of considerable mathematical importance. Later discoveries in the same vein include the finding that the base of the pyramid (when divided by the width of a single casing stone) equals exactly 365—number of days in the year. Many books have been written on the interpretation of the dimensions of the pyramid, none of which has any scientific or archaeological validity. Pyramidology is simply a classic example of the well-known fact that hunting through even a random array of numbers will turn up sequences which appear to be "significant"—always provided that one carefully selects the numbers one wants and turns a blind eye to those that one doesn't!

Pyrrhonism, a sceptical philosophy which doubts everything.

Q

Quakers, a religious body founded in England in the 17th cent. by George Fox (1624–91). The essence of their faith is that every individual who believes has the power of direct communication with God who will guide him into the ways of truth. This power comes from the "inner light" of his own heart, the light of Christ. Quakers meet for worship avoiding all ritual, without ordained ministers or prepared sermons; there is complete silence until someone is moved by the Holy Spirit to utter his message.

In the early days Quakers gave vent to violent outbursts and disturbed church services. Friends had the habit of preaching at anyone who happened to be nearby, their denunciation of "steeple-houses" and references to the "inner light," their addressing everyone as "thee" and "thou," their refusal to go beyond "yea" and "nay" in making an assertion and refusing to go further in taking an oath, must have played some part in bringing about the savage persecutions they were forced to endure. Many emigrated to Pennsylvania, founded by William Penn in 1682, and missionaries were sent to many parts of the world. The former violence gave way to gentleness. Friends not only refused to take part in war but even refused to resist personal violence. They took the lead in abolishing slavery, worked for prison reform and better education. As we know them today Quakers are quiet, sincere, undemonstrative people, given to a somewhat serious turn of mind. The former peculiarities of custom and dress have been dropped and interpretation of the Scriptures is more liberal. Although Quakers refuse to take part in warfare, they are always ready to help the victims of war, by organising relief, helping refugees in distress, or sending their ambulance units into the heat of battle.

Quartodecimani, an early Christian community who celebrated the Easter festival on the 14th day of the month, when the Jews celebrated their Passover. In consequence of the confusion caused, the practice was condemned by the Council of Nicaea in 325.

Quietism, a doctrine of extreme asceticism and contemplative devotion, embodied in the works of Michael Molinos, a 17th cent. Spanish priest, and condemned by Rome. It taught that the chief duty of man is to be occupied in the continual contemplation of God, so as to become totally independent of outward circumstances and the influence of the senses. Quietists taught that when this stage of perfection is reached the soul has no further need for prayer and other external devotional practices. Similar doctrines have been taught in the Moslem and Hindu religions. *See* Yoga.

R

Racism, the doctrine that one race is inherently superior or inferior to others, one of the bases of racial prejudice. It has no connection whatever with the study of race as a concept, nor with the investigation of racial differences, which is a science practised by the physical anthropologist (who studies physical differences), or the social anthropologist (who studies cultural differences). Racism is simply a vulgar superstition believed in by the ignorant or mentally unbalanced, and it may be categorically stated as a scientific fact that racial superiority is a myth believed in by no scientist of repute. *See* Sciences of Man, Section F, Part V.

Radiesthesia, the detection, either by some "psychic" faculty or with special equipment, of radiations alleged to be given off by all living things and natural substances such as water, oil, metal, etc. The word radiesthesia is in fact a fancy modern name for the ancient practice of "dowsing," whereby an individual is supposed to be able to detect the presence of hidden underground water by following the movements of a hazel twig held in his hands. Dowsers, or water diviners, as they are sometimes called, claim also to be able to detect the presence of minerals and, hard though it may seem to believe, have actually been hired by major oil

companies to prospect for desert wells—though without any notable successes. The theory of dowsing is that all things give off a unique radiation signal which the trained individual (via his twig, pendulum, or whatever) can "tune in" to, a theory which, while not backed up by any data known to orthodox sciences, is at least not too fantastically far-fetched. It is when radiesthesists claim to be able to detect the presence of oil, water, or precious metals by holding their pendulum *over a map* of the territory and declare that it is not necessary for them to visit the area in person to find the required spot that the topic moves from the remotely possible to the absurdly improbable. Some practitioners of this art state that they are able to perform even more marvellous feats such as determining the sex of chickens while still in the egg, or diagnosing illness by studying the movements of a pendulum held over a blood sample from the sick individual. Such claims when put to simple scientific test have almost invariably turned out as fiascos. Yet belief in dowsing, water-divining, and the like is still very widespread.

There is an important link between radiesthesia and the pseudo-science of *radionics*, which holds that the twig or pendulum can be superseded by complicated equipment built vaguely according to electronic principles. A typical radionic device consists of a box covered with knobs, dials, etc., by which the practitioner "tunes in" to the "vibration" given off by an object, such as a blood spot, a piece of hair, or even a signature. By the proper interpretation of the readings from the equipment the illness, or even the mental state, of the individual whose blood, hair, or signature is being tested, may be ascertained. The originator of radionics seems to have been a Dr. Albert Abrams who engaged in medical practice using radionic devices in America in the 1920s and 30s. The principal exponent in this country was the late George de la Warr who manufactured radionic boxes for diagnosis and treatment of illnesses, and even a "camera" which he believed to be capable of photographing thought. In a sensational court case in 1960 a woman who had purchased one of the diagnostic devices sued de la Warr for fraud. After a long trial the case was dismissed, the Judge commenting that while he had no good evidence that the device worked as claimed, he felt that de la Warr sincerely believed in its validity and thus was not guilty of fraud or misrepresentation. Some practitioners hold this as in some way justifying or accrediting the science of radionics but most observers feel that the case was more a triumph for British justice and the right of the individual to promote his beliefs whatever they may be—provided they are sincerely held and do no obvious social harm.

Ranters, a derisive term for the Primitive Methodists (*see* Methodism).

Rationalism is defined as "the treating of reason as the ultimate authority in religion and the rejection of doctrines not consonant with reason." In practice, rationalism has a double significance: (1) the doctrine as defined above, and (2) a 19th cent. movement which was given to what was then known as "free-thought," "secularism," or agnosticism—*i.e.*, it was in the positive sense anti-religious and was represented by various bodies such as the Secular Society, the National Secular Society and the Rationalist Press Association (founded in 1899).

In the first sense, which implies a particular philosophical attitude to the universe and l fe, rationalism is not easy to pin down although, at first sight, it would appear that nothing could be simpler. Does it mean the use of pure reason and logic or does it mean, on the other hand, the use of what is generally called the "scientific method" based on observation (*i.e.*, the evidence of our senses) and experiment? If we are thinking in terms of the use of pure reason and logic then the Roman Catholic Church throughout most of its history has maintained, not that the whole truth about religion can be discovered by reason, but as St. Thomas Aquinas held, the basis of religion—*e.g.*, the existence of God—can be rationally demonstrated. Nobody could have made more use of logic than the schoolmen of the Middle Ages, yet not many people today would accept their conclusions, nor would many non-Catholics accept St. Thomas's proofs of the existence of God even when they themselves are religious. The arguments of a first Cause or Prime Mover or the argument from Design on the whole leave us unmoved, partly because they do not lead us to the idea of a *personal God*, partly because we rightly distrust logic and pure reason divorced from facts and know that, if we begin from the wrong assumptions or premises, we can arrive at some very strange answers. If the existence of a Deity can be proved by reason, then one can also by the use of reason come to the conclusions, or rather paradoxes, such as the following: God is by definition all good, all knowing, all powerful—yet evil exists (because if it does not exist then it cannot be wrong to say "there is no God"). But if evil exists, then it must do so either because of God (in which case He is not all good) or in spite of God (in which case He is not all powerful).

Arguments of this sort do not appeal to the modern mind for two historical reasons: (1) many of us have been brought up in the Protestant tradition which—at least in one of its aspects—insists that we must believe in God by faith rather than by logic and in its extreme form insists on God as revealed by the "inner light"; (2) our increasing trust in the scientific method by direct observation and experiment. Thus, no matter what Aristotle or St. Thomas may say about a Prime Mover or a First Cause, we remain unconvinced since at least one scientific theory suggests that the universe did not have a beginning and if scientific investigation proved this to be so, then we should be entirely indifferent to what formal logic had to say.

The secularist and rationalist movements of the 19th cent. were anti-religious—and quite rightly so—because at that time there were serious disabilities imposed even in Britain by the Established Church on atheism or agnosticism and freedom of thought. They are of little significance now because very little is left, largely thanks to their efforts, of these disabilities.

Finally, although most people are likely to accept the scientific method as the main means of discovering truth, there are other factors which equally make us doubt the value of "pure" logic and reason unaided by observation. The first of these is the influence of Freud which shows that much of our reasoning is mere rationalising—*e.g.*, we are more likely to become atheists because we hated our father than because we can prove that there is no God. The second is the influence of a movement in philosophy which, in the form of logical positivism or logical analysis, makes us doubt whether metaphysical systems have any meaning at all. Today, instead of asking ourselves whether Plato was right or wrong, we are much more likely to ask whether he did anything but make for the most part meaningless noises. Religion is in a sense much safer today than it ever was in the 19th cent. when it made foolish statements over matters of science that could be *proved* wrong; now we tend to see it as an emotional attitude to the universe or God (a "feeling of being at home in the universe," as William James put it) which can no more be proved or disproved than being in love.

Realism is a word which has so many meanings, and such contradictory ones, in various spheres, that it is difficult to define. We shall limit ourselves to its significance in philosophy. In philosophy, "realism" has two different meanings, diametrically opposed. (1) The most usual meaning is the one we should least expect from the everyday sense of the word—*i.e.*, it refers to all those philosophies from Plato onwards which maintained that the world of appearance is illusory and that ideas, forms, or universals are the only true realities, belonging to the world beyond matter and appearance—the world of God or mind. In early mediaeval times St. Thomas Aquinas was the chief exponent of this doctrine which was held by the scholastics as opposed to the Nominalists (*q.v.*). (2) In its modern everyday meaning "realism" is the belief that the universe is real and not a

creation of mind, that there is a reality that causes the appearance, the "thing-in-itself" as Kant described it. Material things may not really be what they appear to be (*e.g.* a noise is not the "bang" we experience but a series of shock-waves passing through the atmosphere), yet, for all that, we can be sure that matter exists and it is very possible (some might add) that mind does not.

Reformation, the great religious movement of the 16th cent., which resulted in the establishment of Protestantism. John Wyclif (d. 1384), John Hus (d. 1415) and others had sounded the warning note, and when later on Luther took up the cause in Germany, and Zwingli in Switzerland, adherents soon became numerous. The wholesale vending of indulgences by the papal agents had incensed the people, and when Luther denounced these things he spoke to willing ears. After much controversy, the reformers boldly propounded the principles of the new doctrine, and the struggle for religious supremacy grew bitter. They claimed justification (salvation) by faith, and the use as well as the authority of the Scriptures, rejecting the doctrine of transubstantiation, the adoration of the Virgin and Saints, and the headship of the Pope. Luther was excommunicated. But the Reformation principles spread and ultimately a great part of Germany, as well as Switzerland, the Low Countries, Scandinavia, England, and Scotland were won over to the new faith. In England Henry VIII readily espoused the cause of the Reformation, his own personal quarrel with the Pope acting as an incentive. Under Mary there was a brief and sanguinary reaction, but Elizabeth gave completeness to the work which her father had initiated. *See* **Lutheranism, Calvinism, Presbyterianism, Baptists, Methodism.**

Renaissance is defined in the *Oxford English Dictionary* as: "The revival of art and letters, under the influence of classical models, which began in Italy in the 14th century." It is a term which must be used with care for the following reasons: (1) Although it was first used in the form *rinascita* (re-birth) by Vasari in 1550 and people living at that time certainly were aware that something new was happening, the word had no wide currency until used by the Swiss historian Jacob Burchardt in his classic *The Civilization of the Renaissance in Italy* (1860). (2) The term as used today refers not only to art in its widest sense but to a total change in man's outlook on life which extended into philosophical, scientific, economic, and technical fields. (3) Spreading from Italy there were renaissance movements in France, Spain, Germany, and northern Europe, all widely different with varying delays in time. As the historian Edith Sichel says: "Out of the Italian Renaissance there issued a new-born art; out of the Northern Renaissance there came forth a new-born religion. There came forth also a great school of poetry, and a drama the greatest that the world had seen since the days of Greece. The religion was the offspring of Germany and the poetry that of England."

The real cause of the Renaissance was not the fall of Constantinople, the invention of printing, the discovery of America, though these were phases in the process; it was, quite simply, money. The rise of a new merchant class gave rise to individualist attitudes in economic affairs which prepared the way for individualism and humanism. The new wealthy class in time became patrons of the arts whereas previously the Church had been the sole patron and controller. Thus the artist became more free to express himself, more respected, and being more well-to-do could afford to ignore the Church and even, in time, the views of his patrons.

It is true that art continued to serve to a considerable extent the purposes of faith, but it was judged from the standpoint of art. Mediaeval art was meant to elevate and teach man; Renaissance art to delight his senses and enrich his life. From this free and questing spirit acquired from economic individualism came the rise of modern science and technology; here Italy learned much from the Arab scholars who had translated and commented upon the philosophical, medical, and mathematical texts of antiquity, while denying themselves any interest in Greek art and literature. Arabic-Latin versions of Aristotle were in use well into the 16th cent. The Byzantine culture, though it had preserved the Greek tradition and gave supremacy to Plato, had made no move forward. But the Greek scholars who fled to Italy after the fall of Constantinople brought with them an immense cargo of classical manuscripts. The recovery of these Greek masterpieces, their translation into the vernaculars, and the invention of printing, made possible a completer understanding of the Greek spirit. It was the bringing together of the two heritages, Greek science, and Greek literature, that gave birth to a new vision. But it was not only Aristotle and Plato who were being studied but Ovid, Catullus, Horace, Pliny and Lucretius. What interested Renaissance man was the humanism of the Latin writers, their attitude to science, their scepticism.

The period *c.* 1400–1500 is known as the **Early Renaissance**. During this time such painters as Masaccio, Uccello, Piero della Francesca, Botticelli, and Giovanni Bellini were laying the foundations of drawing and painting for all subsequent periods including our own. They concerned themselves with such problems as anatomy, composition, perspective, and representation of space, creating in effect a grammar or textbook of visual expression. The term **High Renaissance** is reserved for a very brief period when a pure, balanced, classical harmony was achieved and artists were in complete control of the techniques learned earlier. The High Renaissance lasted only from *c.* 1500 to 1527 (the date of the sack of Rome), yet that interval included the earlier works of Michelangelo, most of Leonardo's, and all the Roman works of Raphael.

Ritualism, a tendency which, during the 19th cent., developed in the High Church section of the Church of England to make use of those vestments, candles, incense, etc. which are usually regarded as features of the Church of Rome. Since some opposition was aroused, a Ritual Commission was appointed in 1904 to take evidence and try to find some common basis on which High and Low Church could agree with respect to ceremonial. The report of 1906 in effect recommended the giving of greater powers to bishops to suppress objectionable practices. Although they are often associated together, it is worth while pointing out that there was no special connection between the Oxford Movement or Tractarians (*q.v.*) and Ritualism because Pusey disliked ritual and even Newman, who eventually went over to Rome, held extremely simple services at his church of St. Mary's.

Roman Catholic Church, the Christian organisation which acknowledges the Pope as the lawful successor of St. Peter, the apostle appointed by Christ to be the head of His Church. The reforming impulse at the Second Vatican Council (1962–5), summoned by Pope John, set in train movements towards religious unity and the reform and modernisation of the Church. Pope Paul has made changes in the government and liturgy of the Church but has refused to allow birth control, the marriage of priests and a greater role for women in the Roman Catholic Church. *See also* **Cardinals, Section L.**

Romantic Movement or Romanticism is the name given not so much to an individual way of thinking but to the gradual but radical transformation of basic human values that occurred in the Western world round about the latter part of the 18th cent. It was a great breakthrough in European consciousness and arose through the writings of certain men living during the half-century or more following, say, 1760. It arose then because both time and place were propitious for the birth of these new ideas. There was a revolution in basic values—in art, morals, politics, religion, etc. The new view was of a world transcending the old one, infinitely larger and more varied.

To understand the Romantic movement it is necessary first to take note of the climate of thought preceding the great change; then to account for its beginning in Germany where it did (*see* **Pietism**) during the latter part of the 18th cent., and finally to appraise the writings of those men whose ideas fermented the new

awakening. Briefly, the shift was away from French classicism and from belief in the all-pervasive power of human reason (the Enlightenment) towards the unfettered freedom that the new consciousness was able to engender. What mattered was to live a passionate and vigorous life, to dedicate oneself to an ideal, no matter what the cost (*e.g.*, Byron).

The ideas of the Enlightenment (*e.g.*, Fontenelle, Voltaire, Montesquieu) had been attacked by the Germans Hamann and Herder and by the ideas of the English philosopher Hume, but Kant, Schiller, and Fichte, Goethe's novel *Wilhelm Meister*, and the French Revolution all had profound effects on the aesthetic, moral, social, and political thought of the time. Friedrich Schlegel (1772–1829) said: "There is in man a terrible unsatisfied desire to soar into infinity; a feverish longing to break through the narrow bonds of individuality." Romanticism undermined the notion that in matters of value there are objective criteria which operate between men. Henceforth there was to be a resurgence of the human spirit, deep and profound, that is still going on.

Rosicrucians, an ancient mystical society founded in the 16th cent. by Christian Rosenkreuz which attempted to forge a theoretical link between the great Egyptian religions and the Church of Rome, drawing rituals and philosophy from both camps. The Society did not long survive the death of its founder (he managed to reach the age of 106 incidentally) but has been revived in succeeding centuries by a series of rivalling factions. Perhaps the most famous of these is the Rosicrucian Order (A.M.O.R.C.) which has become well-known in the Western world as a result of its heavy advertising in the popular press. Founded by the American H. Spencer Lewis, this offers a simple and good-natured doctrine preaching the Brotherhood of Man, the reincarnation of the soul and the immense latent potential of the human mind. As with many American-based organisations of this kind, the boundary between business and religion is hard to define. The A.M.O.R.C. Rosicrucian order, for example, proudly advertises that it is not a religion, and it is probably best summed up as a modern secret society which serves an important function in the lives of many people of mystical inclinations.

Rotarianism. The Rotary Club is primarily an American association but has many members in Britain and presumably elsewhere since all Rotary Clubs are united in an international organisation. It consists of groups of business and professional men formed with the purpose of serving their community and humanity in general. The name is derived from the clubs entertaining in rotation.

S

Salvation Army. The religious movement which in 1878 became known by this name arose from the Christian Mission meetings which the Rev. William Booth and his devoted wife had held in the East End of London for the previous thirteen years. Its primary aim was, and still is, to preach the gospel of Jesus Christ to men and women untouched by ordinary religious efforts. The founder devoted his life to the salvation of the submerged classes whose conditions at that time were unspeakably dreadful. Originally his aim had been to convert people and then send them on to the churches, but he soon found that few religious bodies would accept these "low-class" men and women. So it was that social work became part of their effort. Practical help like the provision of soup-kitchens, accompanied spiritual ministration. Soon, in the interests of more effective "warfare" against social evils, a military form of organisation, with uniforms, brass bands, and religious songs, was introduced. Its magazine *The War Cry* gave as its aim "to carry the Blood of Christ and the Fire of the Holy Ghost into every part of the world."

General Booth saw with blinding clarity that conversion must be accompanied by an improvement of external conditions. Various books had earlier described the terrible conditions of the slums, but in 1890 he produced a monumental survey entitled *In Darkest England and the Way Out*. From that time forward the Army was accepted and its facilities made use of by the authorities. Today the Army's spiritual and social activities have spread to countries all over the world; every one, no matter what class, colour, or creed he belongs to is a "brother for whom Christ died."

Sandemanians or **Glassites**, an obscure religious sect whose sole claim to fame is that one of its members was the great Michael Faraday, founder of the science of electromagnetism, who never failed to attend its Sunday services.

Sceptics. From Thales of Miletus (*c.* 624–565 B.C.) to the Stoics in the 4th cent. B.C. philosophers had been trying to explain the nature of the universe; each one produced a different theory and each could, apparently, prove that he was right. This diversity of views convinced the Sceptic school founded by Pyrrho (*c.* 360–270 B.C.) that man is unable to know the real nature of the world or how it came into being. In place of a futile search for what must be for ever unknowable, the Sceptics recommended that men should be practical, follow custom, and accept the evidence of their senses.

Schoolmen. From the time of Augustine to the middle of the 9th cent. philosophy, like science, was dead or merely a repetition of what had gone before. But about that time there arose a new interest in the subject, although (since by then Western Europe was entirely under the authority of the Catholic Church) the main form it took was an attempt to justify Church teaching in the light of Greek philosophy. Those who made this attempt to reconcile Christian beliefs with the best in Plato and Aristotle were known as "schoolmen" and the philosophies which they developed were known as "scholasticism." Among the most famous schoolmen must be counted John Scotus Erigena (*c.* 800–*c.* 877), born in Ireland and probably the earliest; St. Anselm, archbishop of Canterbury (1033–1109); the great Peter Abelard whose school was in Paris (1079–1142); Bernard of Chartres, his contemporary; and the best-known of all, St. Thomas Aquinas of Naples (1225–74), who was given the name of the "Angelic Doctor."

The philosophies of these men are discussed under various headings (God and Man, Determinism and Free-will), but being severely limited by the Church their doctrines differed from each other much less than those of later philosophical schools. However, one of the great arguments was between the orthodox Realists (*q.v.*) and the Nominalists (*q.v.*) and a second was between the Thomists (or followers of St. Thomas Aquinas) and the Scotists (followers of John Duns Scotus—not to be confused with John Scotus Erigena). The two latter schools were known as the Ancients, whilst the followers of William of Occam, the Nominalist, were known as the Terminalists. All became reconciled in 1482 in face of the threat from humanism of which the great exponent was Erasmus of Rotterdam (1466–1536) who hated scholasticism.

Scientology, an unusual quasi-philosophical system started by the American science-fiction writer L. Ron Hubbard, which claims to be able to effect dramatic improvement in the mental and physical well-being of its adherents. Originally developed in the United States as "Dianetics, the modern science of mental health," it was hailed in Hubbard's first book to be "a milestone for Man comparable to his discovery of fire and superior to his inventions of the wheel and the arch." Such extravagant statements exemplify the literature of the movement, which in the late 1950s began to expand in England when its founder came to live in East Grinstead. Followers of Dianetics and Scientology advance within the cult through a series of levels or grades, most reached by undertaking courses of training and tuition, payment for which may amount to hundreds and, in total, even thousands of pounds. These courses consist largely of specialised and complex mental exercises based on Hubbard's own variation of psychology and known as "proces-

sing" and "auditing." One of the principal goals of a Scientologist is the attainment of the state known as "Clear" (roughly speaking, one "cleared" of certain mental and physical handicaps) when it is believed he (she) will be a literally superior being, equipped with a higher intelligence and a greater command over the pattern of his (her) own life.

Orthodox psychologists tend to view both the practice and theory of Scientology with considerable misgivings.

Scientology has for some time been registered across the world as a Church, and its followers may attend religious services modelled on the movement's philosophy.

Shakers, members of a revivalist group, styled by themselves "The United Society of Believers in Christ's Second Appearing," who seceded from Quakerism in 1747 though adhering to many of the Quaker tenets. The community was joined in 1758 by Ann Lee, a young convert from Manchester, who had "revelations" that she was the female Christ; "Mother Ann" was accepted as their leader. Under the influence of her prophetic visions she set out with nine followers for "Immanuel's land" in America and the community settled near Albany, capital of New York state. They were known as the "Shakers" in ridicule because they were given to involuntary movements in moments of religious ecstasy.

Central to their faith was the belief in the dual role of God through the male and female Christ: the male principle came to earth in Jesus; the female principle, in "Mother Ann." The sexes were equal and women preached as often as men at their meetings which sometimes included sacred dances—nevertheless the two sexes, even in dancing, kept apart. Their communistic way of living brought them economic prosperity, the Shakers becoming known as good agriculturists and craftsmen, noted for their furniture and textiles. After 1860, however, the movement began to decline and few, if any, are active today.

Shamans, the medicine men found in all primitive societies who used their magical arts to work cures, and protect the group from evil influences. The *shaman* was a man apart and wore special garments to show his authority. Shamanism with its magical practices, incantations, trances, exhausting dances, and self-torture is practised even today by tribes that have survived in a primitive state of culture.

Shiites or Shia, a heretical Moslem sect in Persia, opposed by the orthodox Sunnites. The dispute, which came almost immediately after the death of the Prophet and led to bitter feuding, had little to do with matters of doctrine as such, but with the succession. After Mohammed's death, there were three possible claimants: Ali, the husband of his daughter Fatima, and two others, one of whom gave up his claim in favour of the other, Omar. The orthodox selected Omar, who was shortly assassinated, and the same happened to his successor as Ali was passed over again. The Shiites are those who maintain that Ali was the true vicar of the Prophet, and that the three orthodox predecessors were usurpers.

Shintoism, literally means "teaching of the Gods" and is the specifically Japanese splinter version of Buddhism with a strong bias towards ancestor worship and the divine powers of natural forces. Unusual in that it had no recognised founder nor written dogma, Shintoism permeated Japanese life in a most vigorous way until the defeat of the country at the hands of the Allied Powers in 1945. In the 1500 years of its existence the Shinto religion produced tens of thousands of unique and beautiful shrines throughout Japan. Vast numbers of these were destroyed by bombing in the war, but a tolerant decision by the American airforce spared the Shinto capital, Kyoto, from air-attack. Shintoism was disestablished by the American occupying forces in 1945 and the Emperor Hirohito "abdicated" his divine powers. Current dissatisfaction among many Japanese with the worldly extravagance of their heavily industrialised society has led to a recent revival of interest in their ancient and selfless religion.

Sikhism. The Sikh community of the Punjab, which has played a significant part in the history of modern India, came into being during a period of religious revival in India in the 15th and 16th cent. It was originally founded as a religious sect by Guru (teacher) Nanak (1469–1538) who emphasised the fundamental truth of all religions, and whose mission was to put an end to religious conflict. He condemned the formalism both of Hinduism and Islam, preaching the gospel of universal toleration, and the unity of the Godhead, whether He be called Allah, Vishnu, or God. His ideas were welcomed by the great Mogul Emperor Akbar (1542–1605). Thus a succession of Gurus were able to live in peace after Nanak's death; they established the great Sikh centre at Amritsar, compiled the sacred writings known as the *Adi Granth*, and improved their organisation as a sect. But the peace did not last long, for an emperor arose who was a fanatical Moslem, in face of whom the last Guru, Govind Singh (1666–1708), whose father was put to death for refusal to embrace Islam, had to make himself a warrior and instil into the Sikhs a more aggressive spirit. A number of ceremonies were instituted by Govind Singh; admission to the fraternity was by special rite; caste distinctions were abolished; hair was worn long; the word singh, meaning lion, was added to the original name. They were able to organise themselves into 12 *misls* or confederacies but divisions appeared with the disappearance of a common enemy and it was not until the rise of Ranjit Singh (1780–1839) that a single powerful Sikh kingdom was established, its influence only being checked by the English, with whom a treaty of friendship was made. After the death of Ranjit Singh two Anglo-Sikh wars followed, in 1845–46, and 1848–49, which resulted in British annexation of the Punjab and the end of Sikh independence. In the two world wars the Sikhs proved among the most loyal of Britain's Indian subjects. The partitioning of the continent of India in 1947 into two states, one predominantly Hindu and the other predominantly Moslem, presented a considerable problem in the Punjab, which was divided in such a way as to leave 2 million Sikhs in Pakistan, and a considerable number of Moslems in the Indian Punjab. Although numbering less than 2 per cent. of the population (c. 8 million) the Sikhs are a continuing factor in Indian political life. In 1966 the Punjab was divided on a linguistic basis—Punjabi-speaking Punjab and Hindi-speaking Hariana.

Socialism, a form of society in which men and women are not divided into opposing economic classes but live together under conditions of approximate social and economic equality, using in common the means that lie to their hands of promoting social welfare. The brotherhood of man inspires the aims of socialism in foreign, colonial, social, and economic policies alike. The word "socialism" first came into general use in England about 1834 in connection with Robert Owen's "village of co-operation" at New Lanark. About the middle of the 19th cent. Charles Kingsley and others established a form of Christian socialism, and William Morris, John Burns, and others founded a Socialist League in 1886. With the development of trade unions the socialist movement took a more practical trend. **Fabianism** (*q.v.*) associated in its early days with the names of Beatrice and Sidney Webb and George Bernard Shaw, aims at the gradual reorganisation of society by creating intelligent public opinion by education and legislation. The British Labour Party believes in peaceful and constitutional change to socialism by democratic methods based upon popular consent. A democratic programme of planned economy and public ownership of certain vital industries and services were features of socialist government from 1945–51 together with a comprehensive system of social security. Although further radical reforms in the interest of social justice and industrial efficiency were initiated by the socialist government during its six years of office, 1964–70, Britain is still far from being an egalitarian society. *See also* **Section C, Part I.**

Southcottians, followers of Joanna Southcott, who died in 1814 shortly after announcing that

(although over 50) she was about to give birth to a divine human being named Siloh. Miss Southcott certainly produced all the symptoms of pregnancy, and was even examined by the Royal physician who pronounced her unquestionably "with child." Although she even went "into labour," no child, divine or otherwise, appeared and she seems to have died of something rather close to a broken heart. Her interesting symptoms would today be classed as "hysterical pregnancy"—a not uncommon condition which may mimic real pregnancy in a remarkable way. Joanna's followers remained loyal to her memory, however, and a tiny sect still survives to this day. Shortly before her death, incidentally, she handed to followers a number of locked and sealed boxes which she indicated contained, among other things, the secret of the universe. These were only to be opened 100 years after her death and then in the presence of 12 bishops. In 1927 one of these boxes unexpectedly turned up and it was ceremoniously opened at the Caxton Hall before a public audience. The organisers had to make do with only one bishop as most of the country's senior clerics pronounced themselves to be too busy to attend. Perhaps it was just as well for Miss Southcott's marvellous box was found to contain only a few rare coins, a horse pistol, a woman's embroidered nightcap, and a slightly improper novel, *The Surprises of Love*. One of the most endearing qualities of Joanna Southcott must have been her sense of humour.

Spiritualism is a religion which requires to be distinguished from psychical research (*q.v.*) which is a scientific attempt carried on both by believers and non-believers to investigate psychic phenomena including those not necessarily connected with "spirits"—*e.g.*, telepathy or clairvoyance and precognition. As a religion (although for that matter the whole of history is filled with attempts to get in touch with the "spirit world") Spiritualism begins with the American Andrew Jackson Davis who in 1847 published *Nature's Divine Revelations*, a book which is still widely read. In this Davis states that on the death of the physical body, the human spirit remains alive and moves on to one or another of a considerable range of worlds or "spheres" where it commences yet another stage of existence. Since the spirit has not died, but exists with full (and possibly even expanded) consciousness, there should be no reason, Davis argues, why it should not make its presence known to the beings it has temporarily left behind on earth. In 1847, the year of the publication of Davis's book, two young girls, Margaret and Kate Fox, living in a farmhouse at Hydesville, New York, began apparently to act as unwitting mediums for attempts at such between-worlds communication. The girls were the focus for strange rappings and bangs which it was alleged defied normal explanation and which spelt out, in the form of a simple alphabetical code, messages from the spirits of "the dead." The Fox sisters were later to confess that they had produced the raps by trickery, but by that time the fashion had spread across the world and before long "mediums" in all lands were issuing spirit communications (often in much more spectacular form). In the late 19th cent. Spiritualism went into a phase of great expansion and for various reasons attracted the attention of many scientists. Among these were Sir William Crookes, Sir Oliver Lodge, Professor Charles Richet, Alfred Russell Wallace, to say nothing of the brilliant and shrewd creator of Sherlock Holmes, Sir Arthur Conan Doyle. Today many people find it astonishing that people of such brilliance should find the phenomena of the seance room of more than passing interest, but the commitment of the Victorian scientists is understandable if we realise that Spiritualists, after all, claim to do no more than demonstrate as fact what all Christians are called on to believe—that the human personality survives bodily death. Furthermore, at the time of the late 19th cent. peak of Spiritualism, much less was known about human psychology and about the great limitations of sensory perception in typical seance conditions, when lights are dimmed or extinguished and an emotionally charged atmosphere generated. Today the most striking phenomena of the seance room—the alleged materialisation of spirit people and the production of such half-spiritual, half-physical substances as ectoplasm—are rarely if ever produced at Spiritualist meetings. Some say that the most probable explanation for this is that too many fraudulent mediums have been caught out and publicly exposed for the profession to be worth the risks. The movement today, which still has a large and often articulate following, now concentrates on the less controversial areas of "mental mediumship," clairvoyance and the like, or on the very widespread practice of "spirit healing." Where people are not deliberately deluded by bogus mediums acting for monetary reward (a practice which largely died out with the "death" of ectoplasm) Spiritualism probably has an important role to play in the life of many people whose happiness has been removed by the death of a much loved relative or spouse. It certainly does not deserve the violent attacks that are often made on it by orthodox clergy who allege that Spiritualists are communicating not with the souls of the departed but with the devil or his emissaries. To many people today belief in the devil would be looked upon as somewhat odder than belief in the survival of the individual spirit after death.

State and Man. Most of the early civilisations such as those of Egypt and Babylonia were theocratic, that is to say, they were arranged in a hierarchy with, at the peak, a king who was also an incarnation of the god. Needless to say, in such circumstances there was no room for philosophising about the nature of the state and the relationship which ought to exist between state and citizens. As usual, we have to turn to ancient Greece for the beginnings of thought about this problem. We do so as briefly as possible since in general it is only the later philosophers whose work has much contemporary interest and, in any case, most people today realise that the political philosophy of a particular time is bound to reflect the actual conditions prevailing then and as such is of mainly theoretical interest today.

The Greek Approach. The early pre-Socratic philosophers Democritus and the Pythagorean school for example, held that the individual should subordinate himself to the whole; they had no doubt that the citizen's first duty was to the state. The Greeks until the time of Plato were not really thinking in terms of individual rights, nor had they given much thought to what form the state should take—they simply accepted it. The first great attempt to describe the ideal state is to be found in Plato's *The Republic* which is referred to elsewhere (*see* Education). His pupil Aristotle did not try to form a utopia but made many comments on the nature of government. Thus, while agreeing that the state was more important than any individual person, he distinguished between good and bad states, and pointed out that to the extent that the state does not enable its citizens to lead virtuous and useful lives it is evil. A good constitution must recognise the inequalities between human beings and confer on them rights according to their abilities: among these inequalities are those of personal ability, property, birth, and status, as freeman or slave. The best forms of rule were monarchy, aristocracy, and democracy; the worst forms—tyranny, oligarchy (or rule of a powerful few), and ochlocracy (or mob-rule). The later Greek thinkers of Hellenistic times held two opposed points of view. The Epicureans (*q.v.*) taught that all social life is based upon self-interest and we become members of a group for our own convenience; therefore there are no absolute rights and laws—what is good is what members decide at that time to be good, and when they change their minds the law must change too. Injustice is not an evil in any god-given sense; we behave justly simply because if injustice became the general rule, we ourselves should suffer. The Stoics (*q.v.*), on the other hand, held that the state must dominate the individual completely and everyone must carry out, first and foremost, his social duties and be willing to sacrifice every-

thing for it; but the state of the Stoics was no narrowly national one, but one that strove to become a universal brotherhood.

The Christian Approach. The orthodox Christian view is expressed in St. Augustine's book *The City of God.* Here it is held that the church, as the worldly incarnation of the City of God, is to be supreme over the state, and the head of the church is to be supreme over secular rulers. In addition it must be recognised that, whilst the secular ruler can make mistakes, the church does not, since it is the representative of God's kingdom on earth.

The Secular State. During the Renaissance (*q.v.*) people began to think for themselves and the results of their cogitations were not always pleasant; for it was during this time that many rulers, petty and otherwise, were seeking absolute authority. Two notable thinkers at this stage were Niccolo Machiavelli (1469–1527) in Italy and Thomas Hobbes (1588–1679) in England, where, of course, the Renaissance arrived later in history. Both supported absolute monarchy against the former domination of the church. The name of Machiavelli has become a by-word for any behaviour that is cunning and unscrupulous, but he was not really as bad as he is usually painted. It is, indeed, true that in his book *The Prince* he showed in the greatest detail the methods by which a ruler could gain absolute control and destroy civic freedom, but this despotism was intended as merely a necessary intermediate stage towards his real idea which was a free, united Italian nation wholly independent of the church. Hobbes was a materialist whose thesis was that man is naturally a ferocious animal whose basic impulse is war and pillage and the destruction of whatever stands in his way to gain his desires. But if he allowed himself to behave in this way his life would be "nasty, brutish, and short" so he creates a society in which he voluntarily gives up many of his rights and hands them over to a powerful ruler in his own interest. But having done this he must obey; even when the ruler is unjust, as he has no right to complain because anything is better than a return to his natural state. The religion of the king must be the religion of the people and the only things no ruler has the right to do is to cause a man to commit suicide or murder or to make him confess to a crime.

Views of Locke: Live and Let Live. John Locke (1632–1704) disagreed with these views. Man is naturally peaceful and co-operative and therefore social life comes readily to him. He sets up an authority in order to preserve the group and that is why laws are made; but the function of the state is strictly limited to maintaining the public good and beyond this men are to be left free. Therefore absolute power and the doctrine of the Divine Right of Kings were wrong because power ultimately rests with the people who have the right to make and break governments. It is also wrong that those who make the laws should be able to execute them. This is the important British doctrine of the separation of powers between the legislature and the executive which, in Britain and America, is regarded as one of the bases of democracy. *See* **Section C, Part II (1).**

Rousseau's Social Doctrine. The only other views we need consider here are those of Jean-Jacques Rousseau (1712–78) and Herbert Spencer (1820–1903), since the views of the two important intervening figures, Hegel and Karl Marx, are dealt with elsewhere (*see* Dialectical Materialism) and after Spencer we come to a stage where political philosophy begins to merge with sociology and the social sciences. Rousseau is a puzzling figure. On the one hand he has been hailed as the prophet of freedom and on the other as the father of modern totalitarianism. His book *Social Contract* (1762) begins with the words: "Man is born free, and everywhere he is in chains." He says that he is in favour, not merely of democracy, but of direct democracy in which everyone has to give his assent to all measures as in the Greek city-states and in Geneva, of which city he was a citizen. (This method is still in force in respect of some measures in the Swiss cantons.) Natural society is based on a "social contract" or mutual agreement and Rousseau speaks of a "return to nature" which would ensure the sovereignty of the people at all times. Thus far, he seems to agree with Locke but soon we find that he is more akin to Hobbes, since (as we are learning in our own day) nothing is more tyrannical than the absolute rule of all the people. (Public opinion is more Hitlerian than Hitler.) As it turns out, then, the "social contract" consists in "the total alienation of each associate, together with all his rights, to the whole community" and "each of us puts his person and all his power in common under the supreme direction of the general will." Rousseau admired direct democracy in the small city-state, but if his doctrine is applied to large states, then the "general will" becomes absolute. It is in this sense that he is regarded as the forerunner of totalitarianism. Herbert Spencer is quoted only as an example of the inappropriate application of a biological theory to social issues. Influenced by Darwin's thesis of natural selection, he saw in society a struggle in which the fittest survived and the less fit perished. Each individual had the right to preserve himself, but in the case of human beings this depended upon group life in which, to some extent, each individual is limited by the rights of others. But this should not go too far, and he condemned the socialism of J. S. Mill which (*a*) would give over-much protection to the unfit, and (*b*) would give the state powers which it has no right to since the best government is the least government. In accordance with Darwinism free competition was essential.

Stoics, the followers of Zeno, a Greek philosopher in the 4th cent. B.C., who received their name from the fact that they were taught in the Stoa Poikile or Painted Porch of Athens. They believed that since the world is the creation of divine wisdom and is governed by divine law, it is man's duty to accept his fate. Zeno conceived virtue to be the highest good and condemned the passions. (*See* **God and Man, State and Man, Determinism and Free-will** for a more detailed account of their beliefs.)

Subud, a cultish movement surrounding the Javanese mystic Pak Subuh which established its headquarters in England in 1958 and made newspaper headlines because of alleged "miracle" cures of both psychological and physical ills. The basis of Subud (which is a contraction of three Sanskrit words, Susila Budhi Dharma, meaning "the right living of the soul") is a single spiritual exercise, the *latihan*, in which the individual comes into contact with, or is overwhelmed by a metaphysical force of some kind which is supposed to produce great mental and physical changes. During the latihan people may make strange movements, some violent, and utter unusual cries or chants. Now better known in America than in Britain, Subud did not live up to the expectations of its early followers, many of whom were people of considerable intelligence and professional standing. It is of particular interest because it represents a unique incursion of a rather obscure Eastern cult into Western life, and suggests again that there is growing dissatisfaction in many quarters with orthodox religion and its contribution to the philosophy of the modern world.

Sunnites, the orthodox sect of Islam as contrasted with the Shiites or Shia (*q.v.*).

Swedenborgianism. The Church of the New Jerusalem, based on the writings of Emanuel Swedenborg (1688–1772), was founded by his followers eleven years after his death. The New Church is regarded by its members not as a sect but as a new dispensation bearing the same relationship to Christianity as Christianity does to Judaism.

Synchronicity, an attempt by the psychologist, Carl Gustav Jung, to explain the apparently significant relationship between certain events in the physical universe which seem to have no obvious "causal" link. This rather involved concept is easily understood if one realises that almost all scientific and philosophical beliefs are based on the notion that the continuous process of change which is taking place in ourselves and in the universe around us is

dependent upon a principle known as causality. We can express this another way by saying that an object moves because it has been pushed or pulled by another. We see because light strikes the retina and signals pass up the nervous system to the brain. A stone falls to the ground because the earth's gravity is pulling it towards its centre etc., etc. For all practical purposes every event can be looked upon as being "caused" by some other prior event and this is obviously one of the most important principles of the operation of the universe. Jung, however, felt that there is a sufficiently large body of evidence to suggest that events may be linked in a significant (*i.e.*, non-chance) way without there being any true causal relationship between them. The classic example he held to be the supposed predictive power of astrology by which there appears to be a relationship between the stellar configurations and the personality and life-pattern of individuals on earth. Jung was scientist enough to realise that there could be no causal connection between the aspect of the stars and the lives of people billions of miles from them, yet felt the evidence for astrology was strong enough to demand an alternative non-causal explanation. The trouble with synchronicity, which has not made much impact on the world of physics or of psychology, is that it is not really an explanation at all but merely a convenient word to describe some puzzling correspondences. The real question, of course, is whether there really are events occurring which are significantly but not *causally* linked, and most scientists today would hold that there were probably not. Still it was typical of the bold and imaginative mind of Jung to tackle head-on one of the principal mysteries of existence and come up with a hypothesis to attempt to meet it.

Syndicalism, a form of socialist doctrine which aims at the ownership and control of all industries by the workers, contrasted with the more conventional type of socialism which advocates ownership and control by the state. Since syndicalists have preferred to improve the conditions of the workers by direct action, *e.g.* strikes and working to rule, rather than through the usual parliamentary procedures, they have been closely related to anarchists (*q.v.*) and are sometimes described as anarcho-syndicalists. Under syndicalism there would be no state; for the state would be replaced by a federation of units based on functional economic organisation rather than on geographical representation. The movement had bodies in the United Kingdom, where guild socialism (*q.v.*) was strongly influenced by its doctrines, in France, Germany, Italy, Spain, Argentina, and Mexico, but these gradually declined after the first world war losing many members to the communists. Fascism (*q.v.*) was also strongly influenced by the revolutionary syndicalism of Georges Sorel in making use of his concept of the "myth of the general strike" as an emotional image or ideal goal to spur on the workers; with Mussolini the "myth" became that of the state. Mussolini was also influenced by Sorel's doctrine of violence and the justification of force. Syndicalism had a certain influence in the Labour Party in its early days, but was crushed by men like Ernest Bevin who began to fear that by involving the workers in direct responsibility for their industries, it would put them at a disadvantage when bargaining for wages.

T

Taoism, a religion which, although in a degenerate state, is still one of the great Eastern creeds. Its alleged founder, Lao-tze, is said to have been born in Honan about 604 B.C.; he is also said to be the author of the bible of Taoism, the *Tao-te-ching*, or in English *The Way of Life*, and to have disapproved of Confucius. This, if true, would hardly be surprising; for Taoism is eminently a mystical religion recommending doing nothing and resisting nothing, whereas Confucianism (*q.v.*) is eminently a practical code of living and its founder insisted on intervening in everything to do with social life. But the truth as revealed by modern scholarship is rather different. We are told that the poems of the *Tao-te-ching* are anonymous and probably originated among recluses in lonely valleys long before the time of Confucius; they were collected and given form at some time late in the 3rd cent. B.C. and their authorship attributed to Lao-tze. It is entirely possible that no such person ever existed (unlike Confucius, who certainly did), but if there were such a man he appears to have used a pseudonym since "Lao" is not a surname but an adjective meaning "old" and it was customary to attribute important works to old men on account of their supposed wisdom. Lao-tze simply means "the old philosopher," and although the *Tao-te-ching* is one of the most remarkable and instructive books ever written it is as anonymous as the Border Ballads.

It is apparent that the religion learned both from the ancient Chinese mystics and from Brahmanism: *Tao*, the Way, is impalpable, invisible, and incapable of being expressed in words. But it can be attained by virtue, by compassion, humility, and non-violence. Out of weakness comes true strength whereas violence is not only wrong but defeats its own ends. There is no personal God and such gods as men imagine are mere emanations of *Tao* which gives life to all things. *Tao* is Being. Works are worthless and internal renunciation is far better than anything that follows from the use of force because passive resistance convinces the other from within that he is in error, whereas violence only compels the external appearance of conviction whilst inwardly the individual is as before. "It is wealth to be content; it is wilful to force one's way on others."

Later Lao-tze became a divinity and indeed one of a Trinity each worshipped in the form of idols (which the founder had hated). Soon there was worship of the forces of nature: the stars, the tides, the sun and moon, and a thousand other deities among whom Confucius was one. The purest mysticism and wisdom had been utterly corrupted by contact with the world.

Telepathy and Clairvoyance. Telepathy is the alleged communication between one mind and another other than through the ordinary sense channels. Clairvoyance is the supposed faculty of "seeing" objects or events which, by reason of space and time or other causes, are not discernible through the ordinary sense of vision. Such claims have been made from time immemorial but it was not until this century that the phenomena were investigated scientifically. The first studies were undertaken by the Society for Psychical Research, which was founded in 1882 with Professor Henry Sidgwick as its first president. Since then it has carried out a scholarly programme of research without —in accordance with its constitution—coming to any corporate conclusions. In America the centre of this research was the Parapsychology Laboratory at Duke University (*see* Parapsychology) where at one time it was claimed clear scientific evidence for extra-sensory perception (ESP) had been obtained. These claims have been treated with great reservation by the majority of scientists but despite the belief that the study of ESP was going into eclipse, there remains a small but measurable residue of interest in scientific research in this area. It would be odd if some scientists were not interested in ESP because of the enormous weight of anecdotal evidence which has built up over centuries to support it. The weakness of the scientific as opposed to the casual evidence is however exemplified by the failure of ESP researchers to produce a reliable "repeatable" experiment.

Theism. *See* God and Man.

Theosophy (Sanskrit *Brahma Vidya* = divine wisdom), a system of thought that draws on the mystical teachings of those who assert the spiritual nature of the universe, and the divine nature of man. It insists that man is capable of intuitive insight into the nature of God. The way to wisdom, or self-knowledge, is through the practice of Yoga (*q.v.*). Theosophy has close connections with Indian thought through Vedic, Buddhist, and Brahmanist literature.

The modern Theosophical Society was founded by Mme H. P. Blavatsky and others in 1875, and popularised by Mrs. Annie Besant.

Tractarianism, a Catholic revival movement, also known as the **Oxford Movement** (not to be confused with the so-called Oxford Group), which had its beginnings at Oxford in 1833. The leaders included the Oxford high churchmen E. B. Pusey, J. Keble and J. H. Newman. Through the *Tracts for the Times* (1833–41), a series of pamphlets which were sent to every parsonage in England, they sought to expose the dangers which they considered to be threatening the church from secular authority. The immediate cause of the movement was the Reform Act (1832) which meant that the state was no longer in the safe keeping of Tories and Churchmen but that power was falling into the hands of Liberals and Dissenters. They advocated a higher degree of ceremonial in worship nearer the Roman communion. In *Tract 90* (the last) Newman showed how the Thirty-nine Articles themselves, which were regarded as the bulwark of Protestantism, could be made to square with Roman doctrine. It was obvious which direction the movement was taking and the romanizing tendency was widely resented. In 1845 Newman went over to Rome. Pusey and Keble persisted in their efforts to secure recognition of Catholic liturgy and doctrine in the Anglican Church. Catholicism of the Anglican type (*i.e.*, Catholic in ritual, ceremony, and everything save submission to the Pope) is termed **Anglo-Catholicism** (*q.v.*).

Transcendental Meditation, popularised in the West by the Maharishi Mahesh Yogi, who achieved sensational worldwide publicity by his "conversion" of the Beatles a few years ago. This is a simple meditational system which it is claimed is an aid to relaxation and the reduction of psychological and physical stress. It is reported that the technique can be taught in under five minutes provided that someone trained by the Maharishi is the teacher. The pupil or would-be meditator is given a mantra—a meaningless word which acts as a focal point for the imagination—and told to concentrate on the word while sitting in a comfortable position. Extraordinary claims are made on behalf of the system, and it is currently being taught at the U.S. Army War College and three army bases, thanks to the conversion of the Commander of the College, Major General Franklin Davies. As with most cults, religious and occult systems, there is an initial psychological benefit to anyone who becomes deeply involved. Nevertheless, apart from this simple "participation-effect," there is some evidence that the body's autonomic functions (heart rate, respiratory cycle, brain waves, etc.) can be modified by certain individuals including yogis. Whether it is ultimately beneficial to be able to modify these autonomic functions or not is another matter. *See also* **Feedback Cult.**

Transmigration of Souls. *See* **Immortality, Buddhism, Hinduism.**

Transubstantiation, the conversion in the Eucharist of the bread and wine into the body and blood of Christ—a doctrine of the Roman Catholic Church.

Trotskyism, a form of communism supporting the views of Leon Trotsky, the assumed name of Lev Bronstein (1879–1940) who, in 1924, was ousted from power by Stalin and later exiled and assassinated in Mexico. Trotsky held that excessive Russian nationalism was incompatible with genuine international communism and that Stalin was concentrating on the economic development of the Soviet Union to an extent which could only lead to a bureaucratic state with a purely nationalist outlook. After the Hungarian uprising in 1956, which was ruthlessly suppressed by the Soviet Armed Forces, a wave of resignations from Western Communist parties took place, many of the dissident elements taking to Trotskyism in its place.

U

Ufology, cultish interest in the study of strange and unexplained aerial phenomena (unidentified flying objects, hence UFOs). *See* **Flying Saucers.**

Underground, the name given to an increasingly well-organised group, mainly composed of young people, university students, etc., which propagates anti-establishment and often highly controversial views. Its history, and to some extent its aims, are obscure, but it is a force of increasing power in Western society and its evolution is worth watching with care. The 1960s have been years of great metamorphosis in Europe and America with rapid changes taking place in our attitudes to war and peace, to sex and morals, to marriage and family, to church and state. For large sections of the population these changes have been too rapid and too radical by far, but for others they have been too slow. In particular, the liberalisation of the law on the so-called "soft drugs," notably marijuana, is advocated by a vocal and increasing minority of young people. The expression of their views has been finding outlet in magazines and newspapers, privately published and printed, which reach a wide circulation despite the disinclination of many newsagents to stock them. These publications, while frequently containing material of an obscene and, to many people, highly offensive nature, also contain articles, features, and poems by writers of repute, many of whom contribute regularly to more orthodox publications and yet are sympathetic to the "underground cause." The word underground here, incidentally, refers back to the "underground press" that published revolutionary material at great risk in Nazi occupied territories during the last war. With the exception of the risque magazine *Private Eye*, which is largely concerned with acid political satire, the first of the genuine underground newsheets was the *International Times* (IT) which was followed in due course by *Oz* and *Rolling Stone*. All three papers are strongly anarchistic in flavour, uneven in literary merit, openly in favour of legalising marijuana ("pot"), and generally quite scandalous to the middle-class and middle-aged. This is not the place to argue the pros and cons of the underground arguments, nor to decide whether our "permissive society" has gone too far or not yet far enough. The important message that the appearance of the whole underground movement implies is that young people, because of greater financial independence, wider opportunities for travel, better education, and easier access to communication channels, such as printing presses, radio transmitters, etc., are beginning to make their admittedly controversial views more widely publicised. Furthermore, this is a trend which will inevitably develop rather than diminish and in the absence of authoritarian repression, these forces will have an increasing impact on our lives. By 1973 however signs of the decline in the power of the underground seemed to be appearing. One of its leading publications *Oz* had folded and its "drop-out" arguments seemed to be appealing less and less to students and young people. The most likely reason for this is that the movement in its decade of vigorous life was successful in inducing a number of reforms ranging from the propagation of a more liberal attitude to what may be printed, spoken about or shown on stage and screen, and an acceptance by school and university authorities that students should have a greater voice in academic affairs. These reforms, whether welcome or not to the middle-aged and the middle class, have nevertheless reached fruition in the "permissive" society which in turn appears to have taken much of the steam out of the underground itself. *See also* **Weathermen.**

Unitarianism has no special doctrines, although clearly, as the name indicates, belief is in the single personality of God, *i.e.*, anti-trinitarian. This general statement, however, can be interpreted with varying degrees of subtlety. Thus unitarian belief may range from a sort of Arianism which accepts that, although Christ was not of divine nature, divine powers had been delegated to him by the Father, to the simple belief that Christ was a man like anyone else, and his goodness was of the same nature as that of many other great and good men. Indeed, today, many Unitarians deny belief in a personal

God and interpret their religion in purely moral terms, putting their faith in the value of love and the brotherhood of man. The Toleration Act (1689) excluded Unitarians but from 1813 they were legally tolerated in England. Nevertheless attempts were made to turn them out of their chapels on the ground that the preachers did not hold the views of the original founders of the endowments. But this ended with the Dissenting Chapels Act of 1845. In America no such difficulties existed, and in the Boston of the 19th cent. many of the great literary figures were openly unitarian both in belief and name: *e.g.*, Emerson, Longfellow, Lowell, and Oliver Wendell Holmes.

Utilitarianism, a school of moral philosophy of which the main proponents were J. S. Mill (1806–73) and Jeremy Bentham (1748–1832). Bentham based his ethical theory upon the utilitarian principle that the greatest happiness of the greatest number is the criterion of morality. What is good is pleasure or happiness; what is bad is pain. If we act on this basis of self-interest (pursuing what we believe to be our own happiness), then what we do will automatically be for the general good. The serious failing of this thesis is (1) that it makes no distinction between the quality of one pleasure and another, and (2) that Bentham failed to see that the law might not be framed and administered by men as benevolent as himself. J. S. Mill accepted Bentham's position in general but seeing its failings emphasised (1) that self-interest was an inadequate basis for utilitarianism and suggested that we should take as the real criterion of good the social consequences of the act; (2) that some pleasures rank higher than others and held that those of the intellect are superior to those of the senses. Not only is the social factor emphasised, but emphasis is also placed on the nature of the act.

Utopias. The name "utopia" is taken from a Greek word meaning "nowhere" and was first used in 1516 by Sir Thomas More (1478–1535) as the title of his book referring to a mythical island in the south Pacific where he sited his ideal society. Since then it has been used of any ideal or fanciful society, and here a few will be mentioned. (The reader may recall that Samuel Butler's 19th cent. novel, describing an imaginary society in New Zealand where criminals were treated and the sick punished, was entitled *Erewhon* which is the word "nowhere" in reverse.) It should be noted that not all utopias were entirely fanciful—*e.g.*, Robert Owen's and François Fourier's beliefs, although found to be impractical, were, in fact, tried out.

Sir Thomas More. More wrote at a time when the rise of the wool-growing trade had resulted in farming land being turned over to pasture and there was a great wave of unemployment and a rise in crime among the dispossessed. More began to think in terms of the mediaeval ideal of small co-operative communities in which class interests and personal gain played a decreasing part, a society which would have the welfare of the people at heart both from the physical and intellectual points of view. His utopia was one in which there was no private property, because the desire for acquisition and private possessions lay at the root of human misery. There was, therefore, only common ownership of land and resources. Each class of worker was equipped to carry out its proper function in the economic scheme and each was fairly rewarded for its share in production so that there was neither wealth nor poverty to inspire conflict. Nobody was allowed to be idle, until the time came for him to retire when he became free to enjoy whatever cultural pleasures he wished, but, since the system was devoid of the waste associated with competition, the working day would be only six hours. There was to be compulsory schooling and free medical care for everybody, full religious toleration, complete equality of the sexes, and a modern system of dealing with crime which was free from vindictiveness and cruelty. Government was to be simple and direct by democratically-elected officials whose powers would be strictly limited and the public expenditure kept under close scrutiny. It will be seen that More was far in advance of his age, and to most democratically-minded people in advance of an earlier utopia, Plato's *Republic*, which is described under the heading of Education.

James Harrington. James Harrington published his book *The Commonwealth of Oceana* in 1656 and offered it to Oliver Cromwell for his consideration but without tangible results. Better than any other man of his time Harrington understood the nature of the economic revolution which was then taking place, and, like More, saw the private ownership of land as the main cause of conflict. He put forward the theory that the control of property, particularly in the shape of land, determines the character of the political structure of the state; if property were universally distributed among the people the sentiment for its protection would naturally result in a republican form of government. The Commonwealth of Oceana was a society "of laws and not of men"—*i.e.*, it was to be legally based and structured so as to be independent of the good or ill-will of any individuals controlling it. Thus there must be a written constitution, a two-house legislature, frequent elections with a secret ballot, and separation of powers between legislature and executive—all today familiar features of parliamentary democracy, but unique in his time.

Saint-Simon. The utopias of the late 18th and 19th cent. come, of course, into the period of the industrial revolution and of laissez-faire capitalism. Individual enterprise and complete freedom of competition formed the outlook of the ruling class. Naturally the utopias of this period tended to have a strongly socialist tinge since such theories are obviously produced by those who are not satisfied with existing conditions. Saint-Simon's *New Christianity* (1825) is one such, and by many, Claude Henri, Comte de Saint-Simon (1760–1825) is regarded as the founder of French socialism. His book urged a dedication of society to the principle of human brotherhood and a community which would be led by men of science motivated by wholly spiritual aims. Production property was to be nationalised (or "socialised" as he describes the process) and employed to serve the public good rather than private gain; the worker was to produce according to his capacity and to be rewarded on the basis of individual merit; the principle of inheritance was to be abolished since it denied the principle of reward for accomplishment on which the society was to be founded. Saint-Simon's proposals were not directed towards the poorer classes alone, but to the conscience and intellect of all. He was deeply impressed with the productive power of the new machines and his scheme was, first and foremost, intended as a method of directing that power to the betterment of humanity as a whole.

Fourier. Francois Marie Charles Fourier (1772–1837), although by conviction a philosophical anarchist who held that human beings are naturally good if allowed to follow their natural desires, was the originator of what, on the face of it, one would suppose to be the most regimented of the utopias. It consisted of a system of "phalanxes" or co-operative communities each composed of a group of workers and technicians assured of a minimum income and sharing the surplus on an equitable basis. Agriculture was to be the chief occupation of each phalanx and industrial employment planned and so carefully assigned that work would become pleasant and creative rather than burdensome. One of his ideas was that necessary work should receive the highest pay, useful work the next, and pleasant work the least pay. The land was to be scientifically cultivated and natural resources carefully conserved. Most of the members' property was to be privately owned, but the ownership of each phalanx was to be widely diffused among members by the sale of shares. Such "parasitic and unproductive" occupations as stockbroker, soldier, economist, middle-man and philosopher would be eliminated and the education of children carried out along vocational lines to train them for their future employment.

The strange thing was that Fourier's suggestions appealed to many both in Europe and the

U.S.A. and such men (admittedly no economic or technical experts) as Emerson, Thoreau, James Russell Lowell, and Nathaniel Hawthorne strongly supported them. An American Fourier colony known as Brook Farm was established and carried on for eight years when it was dissolved after a serious fire had destroyed most of its property.

Robert Owen. Robert Owen (1771–1858), a wealthy textile manufacturer and philanthropist, established communities founded on a kind of utopian socialism in Lanarkshire, Hampshire, and in America. Of his New Lanark community an American observer wrote: "There is not, I apprehend, to be found in any part of the world, a manufacturing community in which so much order, good government, tranquillity, and rational happiness prevail." The workers in Lanark were given better housing and education for their children, and it was administered as a co-operative self-supporting community in Scotland. Later in life Owen returned to sponsoring legislation that would remove some of the worst evils of industrial life in those days: reduction of the working day to twelve hours, prohibition of labour for children under the age of ten, public schools for elementary education, and so on. But he lived to see few of his reforms adopted. He also promoted the creation of co-operative societies, the formation of trades unions, labour banks and exchanges, the workers' educational movement, and even an Anglo-American federation. There can be no doubt that, if he saw little result himself, he left the imprint of his convictions to benefit future communities who may not even know his name.

V

Vitalism, the philosophical doctrine that the behaviour of the living organism is, at least in part, due to a vital principle which cannot possibly be explained wholly in terms of physics and chemistry. This belief was at one time held strongly by the late Professor C. E. M. Joad and is implicit in Henri Bergson's (1859–1941) theory of creative evolution. It was maintained by Bergson that evolution, like the work of an artist, is creative and therefore unpredictable; that a vague need exists beforehand within the animal or plant before the means of satisfying the need develops. Thus we might assume that sightless animals developed the need to become aware of objects before they were in physical contact with them and that this ultimately led to the origin of organs of sight. Earlier this century a form of vitalism described as "emergent evolution" was put forward. This theory maintains that when two or more simple entities come together there may arise a new property which none of them previously possessed. Today biologists would say that it is the *arrangement* of atoms that counts, different arrangements exhibiting different properties, and that biological organisation is an essentially dynamic affair, involving the lapse of time.

W

Wahabis, members of an Arabian sect of Islam which originated in the teaching of Muhammad Ibn 'Abd-al-Wahab, born at the end of the 17th cent. He was deeply resentful of the Turkish rule which, in addition to its tyranny, had brought about innovations in the religion which Muhammad regarded as a perversion of its original form. He proceeded to reform Islam to its primitive conditions and impressed his beliefs on Mohammed Ibn Saud, a sheikh who spread them with the aid of his sword. Under the successors of Ibn Saud the power of the Wahabis spread over much of Arabia where it is dominant today in Saudi Arabia. Its particular characteristic is that it refuses to accept symbolic or mystical interpretations of the words of the Prophet and accepts quite literally the teaching of Islam. It is, in fact, a sort of Moslem fundamentalism. Although crushed by the Turks in 1811–15, the movement remains an important element in Mohammedanism.

Waldenses, a movement also known as "The Poor Men of Lyons," founded by Peter Waldo of that city about the same time, and in the same part of southern France, as the Albigenses (*q.v.*) with whom, however, they had nothing in common. Their main belief was a return to Apostolic simplicity, based on reading the Bible in their own language; their doctrines were somewhat similar to those of the Mennonites and the Quakers. However, they did not wish to separate themselves from the Church and were originally protected by several popes until the Lateran Council of 1215 excluded them mainly for the crime of preaching without ecclesiastical permission. From this time they were subjected to persecution, yet maintained some contact with the Church until the Reformation when they chose to take the side of the Protestants. Situated mainly on the sides of the Alps, half in Piedmont and half in France, they were persecuted or not according to the contemporary political convenience of the Dukes of Savoy, and the major attempt to destroy them called forth Oliver Cromwell's intervention and the famous sonnet of Milton. In spite of torture, murder, deportation, and even the kidnapping of their children, to have them brought up in the Roman Catholic faith, the sect survived, and still exists, having been granted full equality of rights with his Roman Catholic subjects by Charles Edward of Piedmont in 1848.

Weathermen, the rather incongruous name for the most radical and volatile of the many groups making up the so-called "underground" in the United States of America. Unlike most of the loosely-structured organisations involved in the growing anti-establishment front, the Weathermen appear to have direct rather than anarchistic political goals, taking a stand far to the left of traditional politics. Their avowed aim is the total overthrow of the current American political structure, with specific and carefully planned acts of violence as the tools of their trade and the civil police force as one of their prime targets. This has led to a series of bomb explosions, often cunningly planned, and brutal murders of police patrolmen which have deeply shocked the average American citizen. A particularly sinister and ominous feature, to most people's eyes, is the fact that the Weathermen appear to be largely drawn from the highly intelligent and well-educated strata, many of them with well-to-do and/or academic backgrounds. Members of this group make no secret of their contempt for the intellect and political attitudes of the American middle-class, and claim to demonstrate the impotence of Society by their ability to commit flagrant acts of violence with such ease and the equal ease with which they subsequently escape detection and arrest. The elusive nature of the organisation and its uncertain background have led to a number of fantastic speculations about its true origins. One of the oddest of these is the notion, widely held in America, that the Weathermen are in reality financed and backed by the country's extreme *right*—as a means of discrediting in the public eye the slow but steady move towards socialism that seems to be developing there. Such speculations serve really to remind one that the political structure of the United States, remarkably stable for over a century, is entering a confused and tortured revolutionary phase.

Witchcraft. There are various interpretations and definitions of witchcraft from that of Pennethorne Hughes who states that "witchcraft, as it emerges into European history and literature, represents the old paleolithic fertility cult, plus the magical idea, plus various parodies of contemporary religions" to that of the fanatical Father Montague Summers who says that Spiritualism and witchcraft are the same thing. A leading authority on witchcraft, however, the late Dr. Margaret Murray, distinguishes between Operative Witchcraft (which is really Magic (*q.v.*)) and Ritual Witchcraft

which, she says, "embraces the religious beliefs and ritual of the people known in late mediaeval times as 'witches.'" That there were such people we know from history and we know, too, that many of them—the great majority of them women—were tortured or executed or both. Many innocent people perished, especially after the promulgation of the bull *Summis desiderantes* by Pope Innocent VIII in 1484. Himself "a man of scandalous life", according to a Catholic historian, he wrote to "his dear sons," the German professors of theology, Johann Sprenger and Heinrich Kraemer, "witches are hindering men from performing the sexual act and women from conceiving . . ." and delegated them as Inquisitors "of these heretical pravities." In 1494 they codified in the *Malleus Maleficarum* (Hammer of Witches) the ecclesiastical rules for detecting acts of witchcraft. Dr. Murray points out that there have ordinarily been two theories about witchcraft: (1) that there were such beings as witches, that they possessed supernatural powers and that the evidence given at their trials was substantially correct; (2) that the witches were simply poor silly creatures who either deluded themselves into believing that they had certain powers or, more frequently, were tortured into admitting things that they did not do. She herself accepts a third theory: that there were such beings as witches, that they really did what they admitted to doing, but that they did not possess supernatural powers. They were in fact believers in the old religion of pre-Christian times and the Church took centuries to root them out. That there existed "covens" of witches who carried out peculiar rites Dr. Murray has no doubt whatever. The first to show that witchcraft was a superstition and that the majority of so-called witches were people suffering from mental illness was the physician Johann Weyer of Cleves (1515–88). His views were denounced by the Catholic Church. Few people realise how deeply the notion of witchcraft is implanted in our minds and how seriously its power is still taken. For example, the Witchcraft Act was not repealed in this country until the 1950s. Furthermore, as recently as 1944, when the allied armies were invading Europe, the Spiritualist medium Mrs. Helen Duncan was charged with witchcraft and actually sent to prison—a prosecution which brought forth caustic comments from the then prime minister, Winston Churchill. *See also* **Demonism.**

Women's Liberation Movement, the name given to a loosely organised collection of women drawn from all ages and walks of life which appears to be emerging as a latter-day "super-suffragette" movement. Unlike the original suffragette movement, however, which advocated "Votes for Women," the 1970s' version seems to have less definite aims. The principal argument hinges on the fact that with the development of highly efficient methods of contraception (the "pill") women need no longer be "slaves" to their family commitments and the traditional dominant and decision-making role of the male in our society must go. At the same time there should be no more wage or job discrimination against women. The movement has been going from strength to strength in America and is acquiring definite power in local and state politics. In Europe it has made somewhat less dramatic inroads. To many spectators, the movement's bible is the witty if polemical book *The Female Eunuch* by the Australian author Germaine Greer. An equally amusing, if perhaps somewhat less serious counterblast *The Manipulated Man* by the German woman doctor, Esther Vilar, traitorously takes an anti-feminist line. A small victory for the feminist cause has been the slow advance of the abbreviation "Ms" as an acceptable alternative for Mrs or Miss.

World Congress of Faiths, an inter-religious movement which aims to break down barriers between faiths. The first step towards it was taken by the world's parliament of religions held in Chicago in 1893; and similar gatherings were held subsequently at intervals in Europe; but the actual organisation was formed in 1936 by Sir Francis Younghusband; and now an annual conference is held and educational activity carried on.

World Council of Churches, a union of Christian Churches from all over the world (including the Churches of the Protestant, Anglican, and Orthodox traditions, but excluding the Roman Catholic Church), engaged in extending Christian mission and unity throughout the world. All Churches which "accept our Lord Jesus Christ as God and Saviour" are eligible. This modern ecumenical movement stems from the great World Missionary Conference held at Edinburgh in 1910. The World Council was founded in 1948 and meets for consultation from time to time; the fourth assembly met at Uppsala in 1968 to discuss the theme "All Things New." In 1973 it sold all its holdings in companies trading with, or investing in, countries of Southern Africa.

Y

Yoga, a Hindu discipline which teaches a technique for freeing the mind from attachment to the senses, so that once freed the soul may become fused with the universal spirit (*Atman* or *Brahma*), which is its natural goal. This is the sole function of the psychological and physical exercises which the Yogi undertakes, although few ever reach the final stage of *Samadhi* or union with *Brahma* which is said to take place in eight levels of attainment. These are: (1) *Yama*, which involves the extinction of desire and egotism and their replacement by charity and unselfishness; (2) *Niyama* during which certain rules of conduct must be adopted, such as cleanliness, the pursuit of devotional studies, and the carrying out of rituals of purification; (3) *Asana*, or the attainment of correct posture and the reduction to a minimum of all bodily movement (the usual posture of the concentrating Yogi is the "lotus position" familiar from pictures); (4)–(5) *Pranayama*, the right control of the life-force or breath in which there are two stages at which the practitioner hopes to arrive, the first being complete absorption in the act of breathing which empties the mind of any other thought, the second being the ability almost to cease to breathe which allegedly enables him to achieve marvellous feats of endurance; (6) *Pratyahara* or abstraction which means the mind's complete withdrawal from the world of sense; (7) *Dharana* in which an attempt is made to think of one thing only which finally becomes a repetition of the sacred syllable OM, and perhaps by a kind of self-hypnosis, leads (8) to *Samadhi* the trance state which is a sign of the complete unity of soul with reality.

Yoga is very old, and when the sage Patanjali (*c.* 300 B.C.) composed the book containing these instructions, the *Yoga Sutras*, he was probably collecting from many ancient traditions. Some of the claims made by Yogis seem, to the Western mind, frankly incredible; but in the West and especially in recent years Yoga methods have been used at the lower levels in order to gain improved self-control, better posture, and improved health. Whether it achieves these ends is another matter, but the genuine Yogi regards this as a perversion of the nature and purpose of the discipline.

Z

Zen Buddhism, a Buddhist sect which is believed to have arisen in 6th cent. China but has flourished chiefly in Japan; for some reason it has of recent years begun to attract attention in the West thanks to the voluminous writings of Dr. D. T. Suzuki and the less numerous but doubtless much-read books of Mr. Christmas Humphreys. But the fact that these writings exist does not explain their being read, nor why of all possible Eastern sects this particular one should be chosen in our times. What is Zen's attraction and why should anyone take the trouble to read about something (the word

"something" is used for reasons that will become evident) that is not a religion, has no doctrine, knows no God and no after-life, no good and no evil, and possesses no scriptures but has to be taught by parables which seem to be purposely meaningless? One of the heroes of Zen is the fierce-looking Indian monk Boddhidharma (fl. *c.* 516–534) who brought Buddhism to China, of whom it is recounted that when the Emperor asked him how much merit he had acquired by supporting the new creed, the monk shouted at him: "None whatever!" The Emperor then wished to know what was the sacred doctrine of the creed and again the monk shouted: "It is empty—there is nothing sacred!" Dr. Suzuki, having affirmed that there is no God in Zen, goes on to state that this does not mean that Zen denies the existence of God because "neither denial nor affirmation concerns Zen." The most concrete statement he is prepared to make is that the basic idea of Zen is to come in touch with the inner workings of our being, and to do this in the most direct way possible without resorting to anything external or superadded. Therefore anything that has the semblance of an external authority is rejected by Zen. Absolute faith is placed in a man's own inner being. Apparently the intention is that, so far from indulging in inward meditations or such practices as the Yogi uses, the student must learn to act spontaneously, without thinking, and without self-consciousness or hesitation. This is the main purpose of the *koan* the logically insoluble riddle which the pupil must try to solve. One such is the question put by master to pupil: "A girl is walking down the street, is she the younger or the older sister?" The correct answer, it seems, is to say nothing but put on a mincing gait, to *become* the girl, thus showing that what matters is the experience of being and not its verbal description. Another *koan*: "What is the Buddha?" "Three pounds of flax" is attributed to T'ung-shan in the 9th cent. and a later authority's comment is that "none can excel it as regards its irrationality which cuts off all passages to speculation." Zen, in effect, teaches the uselessness of trying to use words to discuss the Absolute.

Zen came to Japan in the 13th cent., more than five centuries after Confucianism or the orthodox forms of Buddhism, and immediately gained acceptance whilst becoming typically Japanese in the process. One of the reasons why it appealed must have been that its spontaneity and insistence on action without thought, its emphasis on the uselessness of mere words, and such categories as logical opposites, had an inevitable attraction for a people given to seriousness, formality, and logic to a degree which was almost stifling. Zen must have been to the Japanese what nonsense rhymes and nonsense books, like those of Edward Lear and Lewis Carroll, were to the English intellectuals. Lear's limericks, like some of the *koans*, end up with a line which, just at the time when one expects a point to be made, has no particular point at all, and *Alice in Wonderland* is the perfect example of a world, not without logic, but with a crazy logic of its own which has no relationship to that of everyday life. Therefore Zen began to impregnate every aspect of life in Japan, and one of the results of its emphasis on spontaneous action rather than reason was its acceptance by the Samurai, the ferocious warrior class, in such activities as swordsmanship, archery, Japanese wrestling, and later Judo and the Kamikaze dive-bombers. But much of Japanese art, especially landscape gardening and flower-arrangement, was influenced similarly, and Zen is even used in Japanese psychiatry. The very strict life of the Zen monks is based largely on doing things, learning through experience; the periods of meditation in the Zendo hall are punctuated by sharp slaps on the face administered by the abbot to those who are unsatisfactory pupils. Dr. Suzuki denies that Zen is nihilistic, but it is probably its appearance of nihilism and its appeal to the irrational and spontaneous which attracts the Western world at a time when to many the world seems without meaning and life over-regimented. However, it has influenced such various aspects of Western life as philosophy (Heidegger), psychiatry (Erich Fromm and Hubert Benoit), writing (Aldous Huxley), and painting (Die Zen Gruppe in Germany).

Zionism, a belief in the need to establish an autonomous Jewish home in Palestine which, in its modern form, began with Theodor Herzl (1860–1904), a Hungarian journalist working in Vienna. Although Herzl was a more or less assimilated Jew, he was forced by the Dreyfus case and the pogroms in Eastern Europe to conclude that there was no real safety for the Jewish people until they had a state of their own. The Jews, of course, had always in a religious sense thought of Palestine as a spiritual homeland and prayed "next year in Jerusalem," but the religious had thought of this in a philosophical way as affirming old loyalties, not as recommending the formation of an actual state. Therefore Herzl was opposed both by many of the religious Jews and, at the other extreme, by those who felt themselves to be assimilated and in many cases without religious faith. Even after the Balfour Declaration of 1917, there was not a considerable flow of Jews to Palestine, which at that time was a predominantly Arab state. But the persecutions of Hitler changed all this and, after bitter struggles, the Jewish state was proclaimed in 1948. Today Zionism is supported by the vast majority of the Jewish communities everywhere (although strongly disapproved of in the Soviet Union as "Western imperialism") and Zionism is now an active international force concerned with protecting the welfare and extending the influence of Israel.

Zoroastrianism, at one time one of the great world religions, competing in the 2nd cent. A.D. on almost equal terms from its Persian home with Hellenism and the Roman Imperial Government. Under the Achaemenidae (*c.* 550–330 B.C.) Zoroastrianism was the state religion of Persia. Alexander's conquest in 331 B.C. brought disruption but the religion flourished again under the Sassanian dynasty (A.D. *c.* 226–640). With the advance of the Mohammedan Arabs in the 7th cent. Zoroastrianism finally gave way to Islam. A number of devotees fled to India there to become the Parsees. In Persia itself a few scattered societies remain.

The name Zoroaster is the Greek rendering of Zarathustra, the prophet who came to purify the ancient religion of Persia. It is thought that he lived at the beginning of the 6th cent. B.C. He never claimed for himself divine powers but was given them by his followers. The basis of Zoroastrianism is the age-long war between good and evil, Ahura Mazda heading the good spirits and Ahriman the evil ones. Morality is very important since by doing right the worshipper is supporting Ahura Mazda against Ahriman, and the evil-doers will be punished in the last days when Ahura Mazda wins his inevitable victory.

The sacred book of this religion is the *Avesta*. If Zoroastrianism has little authority today, it had a very considerable influence in the past. Its doctrines penetrated into Judaism (*q.v.*) and, through Gnosticism, Christianity. The worship of Mithra by the Romans was an impure version of Zoroastrianism. Manichaeism (*q.v.*) was a Zoroastrian heresy and the Albigensianism of mediaeval times was the last relic of a belief which had impressed itself deeply in the minds of men.

GAZETTEER OF THE WORLD

An index and guide to the maps with up-to-date descriptive matter, together with a list of the sovereign members of the Commonwealth and British dependent territories, a map with information on the reorganisation of local government in England and Wales, and a table showing trade figures for the European Economic Community.

GAZETTEER OF THE WORLD

This edition of the gazetteer is the result of a major revision which has attempted to provide an index and guide to the maps. Gazetteer and maps (also newly revised) should be used in conjunction, although it is impractical for reasons of clarity to include every place mentioned in the gazetteer within the map section.

Measurement of Geographical Phenomena.

(1) Physical Features.

In using the gazetteer the reader should note that it is impossible to make absolutely correct measurements of geographical phenomena. For example, measurement of height of land above sea-level depends, in the first instance, upon the definition of the elusive concept of sea-level itself. This is constantly changing and so an arbitrary value of *mean sea-level* is normally used, but the value adopted varies from country to country. As a result, height above sea-level has inbuilt inconsistencies and inaccuracies. Similarly, the length of a river will depend upon the scale of the survey from which measurements are made. Large-scale maps and aerial photographs can show in great detail the sinuous course of rivers, whereas a map on a smaller scale must reduce the amount of information shown and thereby the apparent length. We hope to include in a later edition the results of a yet unpublished work by a commission of the United Nations which is attempting to define in precise terms the area of the world's seas and oceans.

The gazetteer records the heights of mountains, lengths of rivers, and land and sea areas in imperial units, while the maps give the heights of mountains and sea depths in metric units.

(2) Definition of Urban Area.

An even more difficult problem of measurement relates to the definition of the urban area of a town or city. It is possible to define the extent of urban areas in three major ways, by using (1) the administrative area, (2) the physically built-up area, and (3) the socio-geographic, metropolitan area. This latter concept is in many ways the most meaningful for it relates to the notion that a city exerts a strong influence over the population resident beyond its administrative or built-up boundary. For example, the city may provide employment opportunities or shopping and entertainment facilities for a population resident some distance away from it. In order to define " city " in these terms some means of measuring the degree of connection between it and its surrounding hinterland (the city-region) must be found and, needless to say, there is considerable disagreement among workers in this field as to what are the most suitable criteria to use. Different criteria produce different definitions and even the most recent measurements are obsolete within a short space of time. However, the real significance of this less tangible concept of " city " may be illustrated by the fact that recent proposals for the reform of local government in England rest in part upon the concept of the city-region.

The population figures given in the gazetteer normally relate to the city's administrative area. In the case of some large cities two figures are given—(1) for the administrative city, and (2) for the more extensive metropolitan area which surrounds and includes the administrative city.

Place Names.

Where there have been recent changes in place names, the old name is given in brackets and a cross reference directs the reader to the new name. Chinese entries are in the conventional English form and the official Chinese form, based upon the Chinese romanised alphabet adopted in 1958, is given in brackets. *See also* **K183.**

Reorganisation of Local Government in the United Kingdom.

The gazetteer has been modified to incorporate the new system of local government in England, Wales and Northern Ireland. (The reform of Scottish local government will not be implemented until 1975.) Details of the changes will be found on **K186–7** and further information on the background to the reorganisation is provided in **Section C, Part II.**

Editor's Note to Readers.

As a result of the indeterminate and dynamic nature of geographical phenomena inconsistencies and inaccuracies are bound to occur in a gazetteer of this size. The editor welcomes comments and criticisms of the entries based upon local knowledge and will try to make the fullest possible use of information received from readers.

ABBREVIATIONS USED IN THE GAZETTEER

Geographical Names

Ala. = Alabama
Ark. = Arkansas
ASSR = Autonomous Soviet Socialist Republic

A

Aachen (Aix-la-Chapelle), t., N. Rhine-Westphalia, W. Germany; anc. spa t. in coal-field dist.; industl., route ctr.; contains tomb of Charlemagne; p. (est. 1969) 176,800.

Aalen, t., Baden-Württemberg, W. Germany; on R. Kocher; iron, textiles, lens mkg.; p. (1963) 33,700.

Aalst (Alost), t., E. Flanders, Belgium, 15 m. N.W. Brussels; industl., comm. ctr. at rly. junc.; agr. tr.; p. (1968) 45,881.

Aare, R., Switzerland, flows through Brienz and Thun Ls., thence into Rhine; Aare gorges above Meiringen; lgst R. wholly in Switzerland, 181 m. long.

Aarau, t., cap. of Aargau can., Switzerland; precision tools and instruments, shoes, textiles; hydroelectric power; p. (1969) 17,800.

Aargau, can., N. Switzerland; occupies lower Aare R. valley; agr. in valleys, wooded uplands; cap. Aarau; a. 542 sq. m.; p. (1969) 422,000.

Aba, t., Nigeria; N.E. of Pt. Harcourt; mkt., palm oil processing; p. (est. 1970) 155,720.

Abaco, Gt., I., Bahamas, W.I.; sheltered harbours, yachting; exp. crayfish; p. (est. 1969) 6,500.

Abadan, c., Iran; spt., major oil terminal and refining ctr. on A.I. in Persian G.; p. (1966) 272,962.

Abakan, t., RSFSR, on R. A.; recent rly.; sawmilling, food inds.; p. (1970) 90,000.

Abashiri, t., N. cst., Hokkaido, Japan; impt. fishing base; p. (1960) 26,000.

Abaza, t., USSR; E. Siberia; iron ore.

Abbeville, t., N. France; on R. Somme; connected with Paris and Belgium by canals; sugar-milling, carpets, biscuits, beer; p. (1968) 25,702.

Abbots-Langley, v., Herts., Eng.; birthplace of Nicholas Breakspeare (Pope Adrian IV); p. (1961) 18,157.

Åbenrå, spt., S.E. Jutland, Denmark; at head of A. fjord and admin. ctr. of S. Jutland prov.; vehicles, clothing, food processing; p. (1965) 14,591.

Abeokuta, t., Nigeria; N. of Lagos; palm oil, textiles; p. (est. 1970) 222,630.

Aberaeron, t., Dyfed, S. Wales; p. (1971) 1,324.

Abercarn, t., Gwent, Wales; tinplate, knitting pins; former colliery t.; p. (1971) 18,468.

Aberdare, t., Mid Glamorgan, Wales; on R. Cynon; wire cables; former coalmng.; p. (1971) 37,760.

Aberdare Range, mtns., Nat. Park, Kenya; rise to 13,000 ft.; form a section of E. rim of Gr. Rift Valley; equable climate attractive to white settlers; camphor forests, fruit and pastoral agr. at higher alts.

Aberdeen, royal burgh, co. t. of Aberdeenshire, Scot.; between mouths of Rs. Dee and Don; impt. fishing pt. under competition from claims of rapidly growing N. Sea oil ind.; "granite-city"—much granite used in central bldgs.; univ., cath.; p. (1971) 182,071.

Aberdeen, t., S.D., USA; ctr. for wheat and livestock region; rly. wks., farm machin.; p. (1960) 23,073.

Aberdeenshire, co., E. Scot.; in Highlands bordering N. Sea, inc. part of Cairngorms; fishing pts., livestock rearing; co. t. Aberdeen; a. 1,970 sq. m.; p. (1971) 187,961.

Aberdovey, t., Gwynedd, Wales, on estuary of R. Dovey; resort.

Aberfeldy, burgh, Perth, Scot.; in Strath Tay, 4 m. below Loch Tay; mkt.; salmon and trout fishing resort; p. (1971) 1,537.

Abergavenny, t., Gwent, Wales; on R. Usk; light engin.; concrete prods.; cattle mkt.; cas.; p. (1971) 9,388.

Abergele, t., Clwyd, Wales; p. (1971) 12,257.

Aberlour, Charlestown of, burgh, Banff, Scot.; on R. Spey, 12 m. S. of Elgin; p. (1971) 763.

Abernethy, burgh, Perth, Scot.; on R. Tay, once the cap. of the Pictish Kings; p. (1971) 698.

Abersoch, t., Gwynedd, Wales; yachting resort.

Abertillery, t., Gwent, Wales; collieries, tinplate; p. (1971) 21,140.

Aberystwyth, t., Dyfed, Wales; on Cardigan Bay at mouth of R. Ystwyth, resort; cas., univ. college; Nat. Library of Wales; p. (1971) 10,680.

Abidjan, c., cap. of Ivory Coast; pt.; exp. palm oil, cocoa, copra, hardwood, rubber; oil refining at Vridi nearby; p. (est. 1964) 282,000 (met. a.).

Abilene, t., Texas, USA; univ.; agr. processing oil refining; p. (1970) 88,433 (c.), 112,168 (met. a.).

Abilene, t., on Smoky Hill R., Kansas, USA; childhood home of Eisenhower; p. 6,746.

Abingdon, Oxon., Eng.; mkt. t. on R. Thames; cars, leather gds.; mediaeval and Georgian bldgs.; p. (1971) 18,596.

Abingdon, t., Va., USA; timber inds., agr. processing and tr., tobacco; tourist ctr.; p. (1960) 4,758.

Abinger Hammer, v., Surrey, Eng.; former centre of Weald iron industry.

Abkhazskaya, aut. rep., Georgian SSR, USSR; borders Black Sea; sub-tropical crops, tourism; cap. Sukhumi; a. 3,320 sq. m.; p. (1970) 487,000.

Åbo. *See* Turku.

Abomey, anc. cap., Dahomey, former slave mkt.; cotton; p. (est. 1960) 18,900.

Abovyan, t., Armeniyan SSR, USSR; 10 m. from Yerevan; new model t. founded 1963; planned p. 50,000.

Aboyne and Glentanner, par., Aberdeen, Scot.; on R. Dee nr. Ballater; Highland games; resort.

Abraham, Plains of, nr. Quebec, Canada; Wolfe's victory over French under Montcalm, 1759.

Abram, t., Gtr. Manchester, Eng.; engin.; p. (1971) 6,472.

Abrantes, t., Portugal, on Tagus R.; French won battle here in Napoleonic Wars, 1807.

Abruzzo Molise, region, central Italy; high limestone plateaux, narrow cstl. plain bordering Adriatic; poor agr., livestock; methane; forms part of Mezzogiorno; a. 5,880 sq. m.; p. (1969) 1,202,071.

Abu Dhabi, I., emirate, lgst of United Arab Emirates; S.E. Arabian pen.; rich oil reserves; a. 80,000 sq. m.; p. (est. 1968) 46,375.

Abu Qir, v. on A. Bay, Egypt; site of anc. Canopus; Battle of the Nile fought in the Bay 1798; p. 7,086.

Abu Simbel, Nile Valley, Egypt; anc. temples carved out of solid sandstone, one to Rameses II and the other to his Queen; saved from waters of Lake Nasser.

Abydos, anc. t. of Phrygia, Asia Minor, in present Turkey; resisted Philip of Macedon; famed for story of Leander and Hero.

Abydus, ruined c., Upper Egypt; celebrated for its temple of Osiris.

Acajutla, spt., El Salvador; exp. coffee; cement, oil refining, fertilisers; p. (1960) 15,475.

Acapulco de Juárez, spt., Pac. cst., Mexico; major modern resort in bay surrounded by steep mtns.; exp. agr. prods.; p. (1970) 234,866.

Accra, c., cap. of Ghana; spt.; univ.; airpt.; consumer gds.; p. (1968) 615,800 (c.), 758,300 (met. a. inc. Tema).

Accrington, t., Lancs., Eng.; 20 m. N. of Manchester; former cotton ctr.; textile machin., more diversified new inds.; p. (1971) 36,838.

Achill I., Mayo, R.o.I.; mtnous.; agr., fishing, tourism at Dugort and Keal; a. 57 sq. m.; p. (1966) 3,598.

Acireale, spt., Sicily, Italy; cath.; sulphur springs; p. (1961) 48,752.

Aconcagua, mtn., Andes, Argentina; highest peak of Western Hemisphere, alt. 22,835 ft.

Aconquija, Nevada de, mtn. range, in E. Andes. N. Argentina; rises steeply from Chaco lowland to 18,000 ft

Acre. *See* 'Akko.

Acre, st. E. Brazil; isolated within Amazon basin; cap. Rio Branco; a. 59,139 sq. m.; p. (est. 1968) 204,081.

Acton. *See* Ealing.

Adamawa Highlands, Nigeria; rise to over 4,000 ft.; stock rearing.

Adam's Bridge, chain of sandbanks, 22 m. long, in Palk Strait, between India and Sri Lanka; construction of rail causeway mooted.

Adana, t., Turkey; on Seijhan R.; agr. processing and tr.; cas.; cap. of A. prov.; 4th. t. of Turkey; p. (1965) 289,918 (t.), 347,093 (met. a.).

Adapazari, t., Turkey; rly. junction; agr. and tr. ctr., silk, linen; high-grade concentrate from low-grade iron ore deposits in Camdagi a.; p. (1965) 85 579.

Adda, R., N. Italy; flows through L. Como to R

Po.; agr. in wide valley above L. Como; 150 m. long.

Addis Ababa, c., cap of **Ethiopia**; at 8,000 ft. in central highlands; terminus of Djibouti rly., ctr. of coffee tr., light inds.; admin. ctr.; univ., palaces; p.(est. 1968) 190,500.

Adelaide, c., spt., cap. of **South Australia**; on R. Torrens, which flows into G. of St. Vincent; transcontinental rly. connections; univ.; cars, steel tubes, electrical appliances, chemicals, sugar and oil refining; p. (1972) 16,331 (c.), 842,611 (met. a.).

Adélie Land (Terre Adélie), **Antarctica**; French terr. and dependency of Réunion.

Adelsburg, t., **Yugoslavia**; 20 m. N.E. of Trieste; extensive grotto and stalactite cavern.

Aden, spt., cap. of **Democratic Rep. of Yemen**; former Brit. col.; bay behind headlands of Aden t. and Little Aden, excellent anchorage; p. (1964) 150,000 (c.), 225,000 (met. a.).

Aden, G. of, W. Arabian Sea; one of most impt. shipping lanes in world (esp. before closure of Suez canal), pts. of Aden, Berbera, Djibouti; length 550 m., width 300 m. at mouth.

Adige, R., N. **Italy**; upper course forms impt. routeway through Alps between Italy and N.; flows via Verona to Adriatic; 225 m. long.

Adirondack, mtns., **USA**; hgst. peak Mt. Marcy (5,345 ft.), average height 4,000 ft.; scenically attractive, ski resorts, sanatoria; iron ore deposits.

Adlington, t., Lancs., **Eng.**; nr. Chorley; former cotton spinning t.; p. (1971) 4,991.

Admiralty Is., 17 m. sm. coral Is., one lge. I., S.W. **Pac. Oc.**; N. of New Guinea; forms part of Bismarck Archipelago; Australian mandate; anc. civilisation; pearl fishing, coconuts; ch. t. Lorengau.; a. 800 sq. m.; p. (1966) 20,202.

Adour, R., S.W. **France**; rises in Pyrenees, enters Bay of Biscay below Bayonne; 207 m. long.

Adria, mkt. t., Rovigo, **Italy**; formerly on cst., now 14 m. inland, old Etruscan c.; p. (1961) 26,027.

Adrianople. *See* **Edirne**.

Adriatic Sea, branch of the Mediterranean, between Italy and Balkan Peninsula; forms G. of Venice on the N.; chief trading pts., Venice, Trieste, and Ancona on the N., Brindisi and Dürres on the S.; a. 52,000 sq. m., 450 m. long.

Adriatic Highway, Yugoslavia; cst. road across Dinaric Alps motivated by tourist boom.

Adullam or Aidelma, Judean c. of Canaanite origin, S.W. Jerusalem, **Israel**, where David hid in cave from Saul.

Adwick le Street, t., South Yorks., **Eng.**; coal; home of George Washington's family; p. (1971) 18,000.

Adygeyskaya (Adygei), aut. region, **RSFSR**; in foothills of Caucasus; mainly agr. and lumbering; cap. Maykop; a. 2,934 sq. m.; p. (1970) 386,000.

Adzharskaya, aut. rep., Georgian SSR, **USSR**; borders Turkey; mtnous.; sub-tropical crops; cap. Batumi; a. 1,100 sq. m.; p. (1970) 310,000.

Aegades, gr. of rocky Is. off W. cst. of Sicily, Italy; ch. t. Favignana on I. of that name.

Aegean Is., between Greece and Turkey; called the Grecian Archipelago, inc. Crete, Cyclades, Sporades, and Dodecanese; a. 1,506 sq. m.; p. (1961) 477,476.

Aegean Sea, branch of the Mediterranean; studded with Is., between Greece and Turkey; connected through the Dardanelles with Sea of Marmara and thence through the Bosporus Strait with the Black Sea; rich cultural history; coral, sponge fishing; length 400 m., width 200 m.

Afars and Issas, French Territory of the, N.E. **Africa**; formerly French Somaliland (renamed (1967); extends inland from straits of Bab-el-Mandeb; plain, mainly below 600 ft.; hot, dry climate; shark and mother of pearl fisheries; little cultivable land; cap. Djibouti; a. 8,900 sq. m.; p. (1967) 126,000.

Affric, Glen, Inverness, **Scot.**; 30 m. S.W. of Inverness; hydroelectric power.

Afghanistan, rep. (1973), former kingdom, **Asia**; lies N. and W. of Pakistan; cap. Kabul; comm. ctrs. Kabul, Kandahar; mtnous.; ch. Rs., Kabul and Helm; intense summer heat, severe winter cold, scanty rainfall; races, Afghans, aboriginal hill-tribes; languages, official Persian, spoken Pushtu; religion, Islam; cereals, fruit, sheep, horses, camels; inds. carpets, woollens, silks; coal-mng. at Dara-i-Suf; natural gas at Shibarghan; rich copper, lead, iron ore resources undeveloped; no rly.; a. 250,000 sq. m.; p. (est. 1969) 16,516,000.

Africa, second lgst continent, contains 22 per cent of world's land a. but only 8 per cent of p.; diverse physical and cultural conditions; plateaux interrupted in N. and S. by steeply folded, sharply eroded mtn. ranges and by mtn. massifs of Sahara and E. Africa; climate and vegetation vary from hot desert to equatorial rain forest and from Mediterranean woodland to tropical savannah; sparse but ethnically varied p., concentrated mainly along N.W. Mediterranean cst., Nile valley, cst. of W. Africa and N.E. of L. Victoria; little urbanisation; economic development hindered by colonial legacy and neo-colonial international companies, poorly developed transport network, poor soils, inadequate rainfall and low economic value of natural vegetation; schemes like Volta R. multipurpose development designed to alleviate this natural poverty; continent contains 40 per cent of world hydroelectric potential and is storehouse of non-energy producing minerals, but many are exported in unprocessed form; agr. predominant economic activity, except in industl. enclaves of Egypt, Rhodesia and S. Africa; 60 per cent land devoted to subsistence crops; 41 ctys. had achieved independence by 1974 compared with 4 in 1945; a. c. 11,683,000 sq. m.; p. (est. 1969) 345,000,000.

Agadir, spt., S. cst. **Morocco**; wrecked by earthquake, 1960; new t. built S. of former c. in a. of greater geological stability; p. (est. 1965) 30,000.

Agana, cap. of **Guam**; reconstructed after second world war; p. (1970) 2,131 (exc. armed forces).

Agen t., cap. of Lot-et-Garonne, **France**; mkt. t.; aqueduct and bridge over Garonne R.; fruit tr. and processing; p. (1968) 37,470.

Agincourt, v., Pas-de-Calais, **France**; famed for battle in 1415 between English, led by Henry V and French under d'Albert; p. (1968) 220.

Agra, c., Uttar Pradesh, **India**; on Jumna R., 115 m. S.S.E. of Delhi; formerly cap. of Mogul Empire; famous Taj Mahal mausoleum; univ.; footwear; p. (est. 1970) 628,070 (c.), 676,748 (met. a.).

Agrigento, t., S. Sicily, **Italy**; spt., exp. sulphur, salt. Formerly Girgenti, founded Akragas, c. 580 B.C., famous for its temples; birthplace of Empedocles; p. (1969) 52,283.

Aguadilla, spt., **Puerto Rico**; exp. coffee and sugar; p. (1960) 15,943.

Aguascalientes, st., **Mexico**; on central plateau at 6,000 ft.; agr.; mineral springs; cap. A.; a. 2,499 sq. m.; p. (1969) 316,000.

Aguascalientes, t., cap. of A. st. **Mexico**; alt. over 6,000 ft.; 260 m. N.W. of Mexico City; wide range of local inds.; hot springs; p. (1969) 166,900.

Agulhas, C., rocky projection, 100 m. E. of C. of Good Hope, most southerly point of **Africa**.

Ahlen, t., N. Rhine–Westphalia, **W. Germany**; on R. Werse; coalmng., metal and engin. wks.; p. (1963) 42,200.

Ahmadnagar, c., Maharashtra, **India**; admin. ctr.; old Bahmani cap.; lge. tr. in cotton and silk gds.; p. (1970) 133,529.

Ahmedabad, temporary cap. of Gujarat, **India**; Jain temple, mosques; univ.; impt. textile ctr.; oilfield at Nawagam nearby; p. (est. 1970) 1,550,779 (c.), 1,627,619 (met. a.).

Ahvaz or Ahwaz, c., cap. of Khuzestan prov., **Iran**; airpt.; oil, aluminium, steel pipes; p. (1967) 322,068.

Aigues-Mortes, t., Gard dep., **France**; on Rhône delta; canal ctr., once spt., now 3 m. from Mediterranean; salt-works; much of mediaeval t. preserved; tourism; p. (1968) 4,197.

Aiguille d'Arves, mtn., Dauphiné Alps, S.E. **France**; 3 rock needles; hgst. alt. 11,513 ft.

Aiguille du Midi, mtn., Mt. Blanc massif S.E. **France**; rock needle, funicular rly.; alt. 12,608 ft.

Aiguille Verte, mtn., Mt. Blanc massif, S.E. **France**; rock needle overlooking Chamonix; alt. 13,540 ft.

Ailefroid, mtn., Dauphiné Alps, S.E. France; double summit; alt. 12,989 ft.

Ailsa Craig, rocky I., off Ayrshire cst., Scot.; alt. 1,114 ft.; gannetry.

Ain, dep., France; in Jura; mainly agr., famous for pigs and poultry; a. 2,248 sq. m.; p. (1968) 339,262.

Ain, R., France; trib. of R. Rhône, flows S.S.W. from Jura; hydroelectric power; 121 m. long.

Airdrie, burgh, N.E. Lanark, Scot.; 12 m. E. of Glasgow; iron inds., brick and concrete wks., steel tubes, pharmaceutics; p. (1971) 37,740.

Aire, R., West Yorks., Eng.; trib. of Ouse; length 70 m.

Aireborough, t., West Yorks., Eng.; woollens; p. (1971) 29,477.

Aisne, dep., France; borders Ardennes; forested; mainly agr., sugar beet; sm. textile ts.; cap. Laon; a. 2,866 sq. m.; p. (1968) 526,346.

Aisne, R., N.E. France; navigation improved by regularisation; 150 m. long.

Aitolia and Akarnania, Greece; mtnous. prov. on N. side G. of Patras; arable cultivation on cstl. plain; cap. Missolonghi; a. 2,081 sq. m.; p. (1961) 237,407.

Aix-en-Provence, t., Bouches-du-Rhône, France; 18 m. N. of Marseilles; old cap. of Provence; thermal springs; cultural and comm. ctr., agr., inds.; p. (1968) 93,671.

Aix-la-Chapelle. *See* Aachen.

Aix-les-Bains, health resort, Savoy, France; p. (1968) 20,718.

Aizuwakamatsu, t., N. Honshu, Japan; lacquer ware, candles; p. (1969) 106,000.

Ajaccio, spt., cap. of Corsica, France; timber, flour, olive oil, tobacco; tourism; birthplace of Napoleon; p. (1968) 42,300.

Ajman, emirate, one of United Arab Emirates; p. (est. 1968) 4,000.

Ajmer, t., Rajasthan, India; salt extraction, vegetable oils; p. (est. 1970) 269,233.

Akhaia, prov., Greece; impt. currant producing a., livestock; inc. pt. of Patras; a. 1,210 sq. m.; p. (1961) 236,770.

Akhisar, t., Turkey; anc. Thyatira; in fertile agr. basin; p. (1965) 47,422.

Akita, pref., Japan; a. 4,503 sq. m.; contains Japan's lgst oilfield and copper mine; mtns. and fertile lowlands; p. (1965) 1,279,835.

Akita, c., Japan; cap. Akita pref.; old cas. t., pt; oil refining ctr., fertilisers, wood pulp; p. (est. 1969) 237,000.

'Akko (Acre), c., spt., Israel; famous for sieges during Crusades; withstood Napoleon for 61 days in 1799; pt. functions now assumed by Haifa; p. (est. 1964) 31,700.

Akmolinsk. *See* Tselinograd.

Akola, t., Maharashtra, India; cotton; p. (1970) 147,293.

Akosombo, pt., Ghana; pt. and new t. S. of L. Volta; textile factory being built; planned p. 50,000.

Akranes, t., Iceland; N. of Reykjavik; lge. cement wks.

Akron, c., Ohio, USA; lge. rubber mftg. ctr.; maize mills, woollens, machin., chemicals; univ.; p. (1970) 273,266 (c.), 673,485 (met. a.).

Aktyubinsk, t., N.W. Kazakh SSR, USSR; at S. end of Ural mtns; ferro-alloys, engin., lignite, elec. power, chemicals, copper; p. (1970) 150,000.

Akureyri, t., N. Iceland; herring fishery, textiles, food processing; 2nd. t. of Iceland; p. (1962) 9,152.

Akyab, spt., Burma; at mouth of Kaladan R.; exp. rice; pt. suffered during war; p. (est. 1962) 86,451.

Alabama, st., USA; cap. Montgomery, ch. pt. Mobile; "cotton st.", cattle-rearing; fertilisers, chemicals, mng.; a. 51,609 sq. m.; p. (1970) 3,373,006.

Alagôas, st., N.E. Brazil; hot, dry cattle rearing a., poor st. with low literacy rate; cap. Maceió; a. 11,016 sq. m.; p. (1968) 1,400,258.

Alameda, spt. Cal., USA; on I. in San Francisco Bay; impt. naval and air base; pt. inds.; p. (1960) 61,316.

Aland Is. (Ahvenanmaa), group belonging to Finland at entrance of G. of Bothnia; a. 572 sq. m.; p. (1968) 21,500.

Alaska, Arctic st. USA; separated from other sts.; bought from Russia (1868); mtnous.; furs, timber, salmon; major oil discoveries on N. slope present difficult ecological problems for exploitation; route of pipeline from Prudhoe Bay to Valdez now approved; a. 586,400 sq. m.; p. (1970) 294,607.

Alaska G. of, S. cst. A., USA.; semi-circular G. with precipitous csts.; oil in Cook Inlet and Controller B.; a. 2,000 sq. m.

Alaska Highway, from Dawson Creek, B.C. Canada, to Fairbanks, Alaska, USA; 1,527 m. long; built for second world war programme; main supply base and H.Q., Edmonton, Alberta.

Alaska Range, mtn. massif, S.A., USA.; extends in arc of 400 m.; separates S. cst. and N. tundra; S.E. flowing glaciers; many peaks over 10,000 ft.; Mt. McKinley, 20,270 ft.

Alatau, mtns., bdy. of Kazakhstan, USSR; and Sinkiang, **China**; group of 5 ranges, outliers of Tien-Shan; alt. up to 15,000 ft.; highest peak Khan Tengri, 22,800 ft.

Alava, Basque prov., N. Spain; ch. t. Vitoria; viticulture; a. 1,175 sq. m.; p. (1961) 138,934.

Albacete, prov., S.E. Spain; stock-raising; a. 5,739 sq. m.; p. (1961) 370,976.

Albacete, t., cap. of A. prov., Spain; agr. mkt., fruit, saffron; p. (1967) 83,495.

Alba-Iulia, t., Romania; on R. Mures, formerly Carisburgh; union of Transylvania with Romania proclaimed here 1918; p. (1966) 22,225.

Albania, rep., S.E. Europe; lying along Adriatic, adjacent to Yugoslavia and Greece; politically aligned with China; recent industl. development with Russian and Chinese aid; food ch. ind.; petroleum reserves and refining, hydroelectric power, coal, chrome ore, copper, iron ore; fastest growing p. in Europe; cap. Tirana; a. 10,629 sq. m.; p. (est. 1969) 2,075,000.

Albano, crater L., Italy; tourist attraction 15 m. S.E. of Rome; steep sides; a. 3 sq. m.

Albany, mkt t., Ga., USA; on Flint R.; agr ctr.; cotton, food; p. (1960) 52,890.

Albany, c., cap. of N.Y. st., USA; R. pt. on Hudson R.; admin. and industl. ctr.; p. (1970) 113,857 (c.), 710,602 (met. a.).

Albany, t., W. Australia; pt. on King George Sound; fruit ch. exp.; founded (1826) as penal col.; p. (1972) 13,055.

Albert, L. *See* **Mobutu Sese, L.**

Alberta, prov., W. Canada; part of prairies; Rockies, in W.; wheat, livestock, feed crops; coal less impt. with development of rich oil and gas resources; chemicals, timber; cap. Edmonton; a. 255,285 sq. m.; p. (1971) 1,627,874.

Appleton, c., Wis., **USA**; industl. c. in rich dairy dist.; p. (1960) 48,411.

Apsheron, peninsula, E. Azerbaydzhan SSR, **USSR**; on W. side of the Caspian; petroleum wells (nr. Baku) and mud volcanoes.

Apulia, region, S.E. **Italy**; hilly, cstl., pastoral plain; grain, fruits, livestock; wine, olive oil; a. 7,470 sq. m.; p. (1969) 3,628,909.

Aqaba, t., **Jordan's** only spt. at head of G. of A., 55 m. from Israeli Elat; exp. phosphates, imports petroleum; p. (1961) 8,908.

Aqaba G., Red Sea, between Sinai Peninsula and Saudi Arabia; impt. Biblical waterway; few few natural harbours, Dahab, Elat, Aqaba main pts.; Elat ctr. of mng. a., and airpt.; length 100 m., width 15 m.

Aquila, t., cap. of Abruzzi prov., **Italy**; on R. terrace of R. Aterno; mkt. and sm. inds. ass. with local farming; holiday resort; cath.; p. (1969) 58,845.

Aquitaine, Basin of, geographical region, S.W. **France**; to W. and S.W. of Central Massif, to N. of Pyrenees, bordered on W. by Atl. Oc.; warm, wet, oceanic climate; rich agr. lowland; inc. Landes, reclaimed sandy area; ch. ts. Bordeaux, Toulouse.

Arabia, peninsula, **S.W. Asia**; mainly desert plateau, lying between Red Sea and Persian Gulf; inc. Saudi Arabia, Yemen, Yemen Arab Rep., Oman, United Arab Emirates, Kuwait, Bahrain, Qatar; coffee, dates, gums, horses, camels; E. Arabia rich in oil reserves; a. 1,000,000 sq. m.; p. 8,000,000.

Arabian Desert, E. **Egypt**; between R. Nile and Red Sea; alt. approx. 1,200–6,000 ft.; a. 80,000 sq. m.

Arabian Mtns., ridge along W. and S.W. csts. of Arabia; volcanic, hgst. peaks in Yemen Arab Rep.; average alt. 5,000 ft., rising to over 12,000 ft.

Arabian Sea, N.W. part of Indian Oc., tr. in Arab dhows; width 1,800 m.

Aracaju, spt., cap. of Sergipe st., **Brazil**; sugar, soap, textiles, tanneries; p. (est. 1968) 156,243.

Arad, new t. (1962) **Israel**; in Negev desert, nr. Beersheba; inds. to be based on gasfields at Zohar and Kanaim; chemicals.

Arad, t., **Romania**; industl., route ctr. on R. Mures; p. (est. 1969) 185,181.

Arafura Sea, N. of Australia, S.W. of Papua–New Guinea, and E. of Timor.

Aragua, sm. upland cstl. st., **Venezuela**; lies in densely populated industl., agr., urban and political region of cty.; tropical climate; good road network; cap. Maracay in fertile Aragua valley; a. 2,708 sq. m.; p. (1961) 313,274.

Araguaia R., **Brazil**; trib. of Tocatins R.; splits into 2 parts in middle course to form Banaral I.; rapids; length 1,000 m.

Arak, t., **Iran**; mkt. and agr. processing ctr. for surrounding region on Trans-Iranian rly.; carpets; p. (1966) 72,087.

Aral Sea (Aral'skoye More), inland sea with no outlet, **USSR**; fed by Amu-Dar'ya and Syr Dar'ya Rs.; sparse p. on shore but attempts to develop agr.; a. 24,635 sq. m.

Aran Is.; Galway, **R.o.I.**; inc. anc. religious ctr. and I. of Inishmore; fishing; agr.; a. 18 sq. m.; p. (1966) 1,612.

Arandelovac, t., **Yugoslavia**; industl. a. based on local sources of refractory clays.

Aranjuez, t., **Spain**; 18th cent. planned t. on R. Tagus; mkt. gardens; strawberries, asparagus; p. (1960) 27,251.

Ararat, volcanic mtn., **Turkey**; supposed resting-place of Noah's Ark.; 16,945ft.

Ararat, t., Victoria, **Australia**; on W. Highway; ctr. of fertile lava agr. a.; forestry; p. (1972) 8,317.

Aras (**Araxes**) **R.**, flows from Bingöl Dağlari mtns. (**Turkey**) to Caspian Sea forming long sections of **USSR**–Iran frontier; valley in rich fruit growing a.; home of anc. civilisation; length 550 m.

Araucania, terr., **Chile**; concentration of A. Indians, especially in Rio Tolten valley.

Arbroath, royal burgh, Angus cst., **Scot.**; engin., textiles, fishing; pt.; holiday resort; p. (1971) 22,586.

Arcachon, t., Gironde, S.W. **France**; on S. side of Bassin d'Arcachon, Bay of Biscay; fish. pt., oysters; resort; p. (1968) 15,755.

Arcadia, region of anc. **Greece** in Peloponnesus; tradition of pastoral agr. in dry a.; ch. c. was Megalopolis.

Arctic Ocean, almost landlocked sea extending from N. Pole to Atl. Oc.; flora and faura of scientific interest; a. 5,440,000 sq. m.

Ardabil, anc. c. in fertile agr. a., Azerbaijan, **Iran**; t. and route ctr.; carpets; p. (1966) 83,546.

Ardal, t., **Norway**; on Sogne fiord; site of aluminium wks.

Ardèche, dep. S. **France**; Cevennes Mtns.; olives, wine, silk, minerals; cap. Privas; a. 2,144 sq. m.; p. (1968) 256,927.

Ardennes, hilly wooded region, **Belgium**, N. **France**, **Luxembourg**, rising to over 2,000 ft.; infertile; heavy fighting in both world wars.

Ardennes, dep., N.E. **France**; farming, woollens, iron; cap. Mézières; a. 2,027 sq. m.; p. (1968) 309,380.

Ardglass, sm. t., Down, **N. Ireland**; one of N.I.'s impt. fishing pts.

Ardnacrusha, Clare, **R.o.I.**; power sta. on R. Shannon, 3 miles N. of Limerick.

Ardnamurchan, most westerly point of mainland of Scot., Argyll.

Ardrishaig, sm. spt., Argyll, **Scot.**; on Loch Gilp, at entrance to Crinan canal.

Ardrossan, burgh, Ayrshire, S.W. **Scot.**; resort and spt. on Firth of Clyde; oil storage, ship-bldg., road bitumen, engin.; p. (1971) 10,562.

Ards, l. gov. dist., **N. Ireland**; formerly part of Down; N. of Strangford L.; main t. Newtownards.

Arecibo, spt., N. cst. **Puerto Rico**; sited in rich agr. a.; local hydro-elec. power; p. (1960) 28,460.

Arendal, spt. **Norway**; on Skagerrak; wood pulp, aluminium, shipping; p. (1960) 11,395.

Arequipa, c., Peru; cap. of A. prov. and former Inca c.; impt. wool mkt.; alpaca wool inds.; growth point for prov. industl. development; copper mng. nearby; earthquakes frequent; p. (est. 1969) 187,400.

Arezzo, c., cap. of Arezzo prov., Tuscany, **Italy**; hill site in basin within Apennines at junc. of valley routes; in mediaeval times ctr. of learning and the arts; birthplace of Petrarch and Vasari; Gothic cath.; mkt. for silk, wine, olives; p. (est. 1969) 85,954.

Argenteuil, t., Val-d'Oise, **France**; N.W. sub. of Paris; industl., mkt. gardens; p. (1968) 90,929.

Argentina, fed. rep., **S. America**; 2nd. in a., 3rd. in p. of S. American sts.; p. predominantly of European origin and highly urbanised; varied relief and climate, inc. Andes, tropical N., Chaco, Pampas, Patagonia in S.; agr. less impt. internally than other S. American sts., yet provides most of exp., inc. meat, wool, wheat,

maize, cotton; petroleum, natural gas; cap. Buenos Aires; a. 1,079,965 sq. m.; p. (est. 1970) 23,360,000.

Argonne, hill ridge, S.E. Paris basin, **France**; composed of greensand; wooded; fighting in 2nd world war; alt. 1,000 ft.; a. approx. 250 sq. m.

Argos, c. of anc. **Greece**; N.E. Peloponnesus; leading c. in 7th cent. B.C. under King Pheidon.

Argostólion, cap. of Cephalonia I., **Greece**; shipbldg.; earthquake 1953; p. (1961) 8,205.

Argyll, co., **W. Scot.**; mtnous., sea-lochs; deer forests, pastoral agr., fishing, distilling; a. 3,165 sq. m.; p. (1971) 59,780.

Arhus, c., **Denmark**; prin. spt. on E. cst. Jutland; admin. ctr. of A. prov.; Gothic cath.; univ.; comm. and industl. ctr.; pt. processing inds., oil refining; p. (est. 1969) 111,266 (c.), 193,573 (met. a.).

Arica, spt., **N. Chile**, free zone; exp. tin, copper, sulphur mainly from Bolivia; rly. to La Paz and oil pipeline connects to Sica-Sica in Bolivia; p. (1960) 46,542.

Ariège, dep., S. **France**; Pyrenees in S., fertile lowland in N.; livestock, fruit, iron, copper; cap. Foix; a. 1,892 sq. m.; p. (1968) 138,478.

Arizona, st., **USA**; home of Apache Indians; much desert, rainfall increasing to E.; many lge. irrigation schemes for cotton, grain, fruit, vegetables; inc. Col. Plateau and Grand Canyon to N.; copper, lead mng. and refining; prin. ts. Phoenix (cap.), Tucson; a. 113,909 sq. m.; p. (1970) 1,752,122.

Arkansas, st., **USA**; highland in N.W., inc. Ozark, Ouachita mtns.; lowland in S.E. where Arkansas R. and Mississippi alluvium; humid climate; cotton cultivation; bauxite, coal, petroleum; cap. Little Rock; a. 53,102 sq. m.; p. (1970) 1,886,210.

Arkansas, R., **USA**; rises in Rockies, trib. of Mississippi; completion (1971) of 440 m. waterway (17 dams and locks), opening Okla. and Ark. to sea; flows through impt. agr. as.; several major cs. on banks; length 1,459 m.

Arkhangel'sk, c., major spt., **USSR**; on E. side Dvina estuary, White Sea; lge. harbour kept open in winter by ice breakers; fishery headquarters; exp. and inds. from local softwood resources; engin.; hydro-elec. power; p. (1970) 343,000.

Arklow, U.D. spt., Wicklow, **R.o.I.**; fisheries, pottery; fertiliser plant under construction; resort; p. (1966) 6,056.

Arlberg, Alpine pass, 5,912 ft.; main western entry to **Austria**; rly. tunnel 6·2 m. long.

Arles, t., Provence, S. **France**; on Rhône delta; anc. Roman t.; historic bldgs and monuments; Van Gogh and Gauguin painted here; p. (1968) 46,136.

Arlington, t., Mass., **USA**; residtl. sub. of Boston; agr. ctr.; p. (1960) 49,953.

Arlington, t., Texas, **USA**; aircraft, missiles; rapid expansion; p. (1960) 44,775.

Arlington, t., Va., **USA**; Arlington National Cemetery contains tombs of the Unknown Soldier and President Kennedy.

Arlon, t., cap. of Luxembourg prov. **Belgium**; p. (1962) 13,373.

Armadale, burgh, West Lothian, **Scot.**; 10 m. S.W. Linlithgow; extractive inds.; p. (1971) 7,152.

Armagh, former co.; l. gov. dist., **N. Ireland**; lowland in N. rising to over 1,500 ft. adjoins **R. o. I.** border; mainly rural; p. of former co. (est. 1971) 133,196.

Armagh, t., A., **N. Ireland**; caths.; linen, whiskey; p. (est. 1971) 12,297.

Armavir, c., Krasnodar Terr., **RSFSR**, on Kuban R.; rly. junc.; engin.; food processing; p. (1970) 146,000.

Armenia, constitutent rep., **USSR**; former a. divided between Turkey, Russia, Iran; rich mineral deposits, mineral inds.; sub-tropical agr.; hydro-elec. stas. under constr.; cap. Yerevan; a. 11,900 sq. m.; p. (1970) 2,493,000.

Armenia, t., **Colombia**; coffee; p. (1969) 162,837.

Armentières, mftg. t., Nord, **France**; base of British operations against Lille in first world war; textiles; p. (1968) 28,469.

Armidale, t., N.S.W., **Australia**; univ.; caths.; ctr. of wool industry; p. (1966) 14,990.

Arnhem, c., cap. of Gelderland prov., **Neth.**; on R. Neder-Rhine; lge. tin smelter; lt inds. using rubber and rayon; p. (est. 1969) 133,391 (c.), 268,987 (met. a.).

Arnhem Land, N. part of **N.T., Australia**; an aboriginal reserve.

Arno, R., central **Italy**; flows past Florence and Pisa into Mediterranean; Val d'Arno is the fruitful valley of the R.; length 75 m.

Arnold, t., Notts., **Eng.**; almost continuous with Nottingham; hosiery, brick mkg.; p. (1971) 33,254.

Arnstadt, t., Erfurt, **E. Germany**; on R. Gera, 10 m. S. of Erfurt; artificial silk, leather gds., engin.; p. (1965) 27,368.

Aroostook, dist., New England, **USA**; produces 12 per cent of USA potatoes.

Arran, I., Bute, **Scot.**; in Firth of Clyde; contains many summer resorts; a. 165 sq. m.; p. (1971) 3,576.

Arras, t., cap. of Pas-de-Calais dep., **France**; historic cap. of Artois; renowned for tapestry; agr. mkt.; brewing, textiles, metal inds.; almost destroyed in first world war; p. (1968) 53,573.

Boreham Wood, t., Herts., **Eng.**; lt. engin., computers, film studios.

Borinage, dist. around Mons, **Belgium**; impt. but declining coalfield.

Borislav, t., Ukrainian SSR, **USSR**; formerly Polish (1919–39); oilfield, natural gas; richest ozocerite deposits in Europe; oil pipeline links to Drogobych and Dashava; p. 32,000.

Borisoglebsk, t., **RSFSR**; food processing; p. 54,000.

Borisov, t., Belorussiyan SSR, **USSR**; defeat of Napoleon, 1812; chemicals, sawmills, hardware; p. (est. 1967) 74,000.

Borkum, I., **W. Germany**; off Ems R. estuary; a. 14 sq. m.; p. 6,000.

Borlänge, t., **Sweden**; iron, paper, engin. and chemical wks.; p. (1968) 29,060.

Borneo, lgst. I. in Malay archipelago and 3rd lgst. in world; high mtn. range extends from ctr. to N. rising to 13,700 ft.; low-lying swamp in S.; politically divided into Kalimantan (Indonesian B.), Sabah and Sarawak (E. Malaysia) and Brunei; jungle-covered and

underdeveloped; scattered tribes inc. Dyaks; few nodes of development around oilfields (Sarawak and Brunei), as, of forest exploitation (Sabah); new settlement in Barito valley (Kalimantan); a. 285,000 sq. m.; p. c. 6,000,000.

Bornholm, I. in Baltic Sea, **Denmark**; mostly granite with poor soils; cattle rearing; kaolin; tourism and fishing impt.; cap. Rønne; a. 210 sq. m.; p. (1965) 48,620.

Bornu, region, Nigeria; S.W. of L. Chad; former Moslem st.; a. 51,000 sq. m.; p. (est.) 5,000,000.

Borobudur, Java, Indonesia; gr. Buddhist temple, once ruined, now restored under government care.

Borrowdale, valley, Cumbria, **Eng.**; tourist resort; former graphite mines.

Boscastle, spt., Cornwall, **Eng.**; resort; pilchard fishing; sm. harbour built for slate exp.

Boskoop, v., S. Holland, **Neth.**; flowering-shrub nurseries; p. (1967) 10,641.

Bosnia and Hercegovina, rep., **Yugoslavia**; mtnous., forested, watered by R. Sava and tribs.; one-fourth cultivated; tobacco, cereals, fruit; cattle, sheep, pigs; mineral deposits in Bosnia; cap. Sarajevo; a. 19,768 sq. m.; p. (1961) 3,277,948.

Bosporus or Strait of Constantinople (Karadeniz Boğazi), between Black Sea and Sea of Marmara; suspension bridge, first to link Europe and S.W. Asia, opened 1973.

Bossier City, t., La., **USA**; oil refineries, rly. wks., chemical and processing plants; p. (1960) 32,776.

Boston, t., Lincs., **Eng.**; sm. pt. on Witham R., 4 m. from Wash; agr. mkt., fruit and vegetable canning; p. (1971) 25,995.

Boston, c., st. cap. Mass., **USA**; fine harbour and leading pt. at head of Boston Bay; cultural, comm. and financial ctr., impt. mkt. for fish and wool; 3 univs.; leading c. in 19th cent.; varied inds. inc. leather, rubber, textiles, shoes and elec. gds.; p. (1970) 628,215 (c.), 2,730,228 (met. a.).

Bosworth or Market Bosworth, t., Leics., **Eng.**; battle between Richard III and Henry VII, 1485; p. (1971) 32,219 (dist.).

Botany Bay, N.S.W., **Australia**; inlet of Tasman Sea on E. cst., 10 m. S. of Sydney; resort; first settled by Brit. in 1787; old penal colony; deep-water pt. planned.

Botaşani, t., N. Moldavia, **Romania**; in rich pastoral a.; flour milling, tanning; p. (1968) 35,707.

Bothnia, G. of, N. of Baltic; between Finland and Sweden, breadth about 100 m.; shallow sea, many Is.

Botswana, Rep. of, indep. sov. st. within Brit. Commonwealth (1966) S.W. **Africa**; stretches from Orange R. to Zambesi R., and merges W. into Kalahari desert; Bamangwato ch. tribe; cap. Gaborone; cattle-rearing; lge. potential copper and nickel ores; a. 222,000 sq. m.; p. (est. 1969) 629,000.

Bottrop, t., N. Rhine–Westphalia, W. **Germany**; once a sm. t., now ctr. of Ruhr coal basin; p. (est. 1969) 108,200.

Bouches-du-Rhône, dep., S. **France**; covers Rhône delta and inc. the Camargue and Crau; lagoon cst.; mainly agr. but inc. industl. complex ass. with cap. of Marseilles; a. 2,035 sq. m.; p. (1968) 1,470,271.

Bougainville, I. of Solomon Is., terr. of **New Guinea**; major reserve of copper in Panguna valley; new mng. ts. of Anewa Bay and Panguna; forested; a. 4,100 sq. m.; p. (1966) 72,490.

Bougie. *See* Bejaia.

Boulder, t., W. **Australia**; included in Kalgoorlie mun.; p. (1966) 19,892 (joint p.).

Boulder, t., Col. **USA**; gold- and silver-mng. dist.; univ.; resort; p. (1960) 37,718.

Boulder City, t., Nevada, **USA**; nr. Gr. Boulder Dam, gr. engin. project; p. (1960) 4,059.

Boulogne-Billancourt, S.W. sub. of Paris, **France**; motor car, aircraft inds.; p. (1968) 109,008.

Boulogne-sur-Mer, t., Pas-de-Calais dep., **France**; on English Channel; comm. and fish. pt.; Channel ferry; pt. inds.; p. (1968) 50,138.

Bounty I., N.Z., S. Pac. Oc.; uninhabited.

Bourg-en-Bresse, t., cap. of Ain dep., **France**; route ctr., varied inds.; p. (1968) 40,407.

Bourges, t., cap. of Cher dep., **France**; cath.; brewing, cutlery, machin., aircraft; p. (1968) 73,998.

Bourget, L., Savoie, **France**; tourist a.

Bourne, t., Lincs., **Eng.**; agr. machin.; p. (1971) 6,461.

Bournemouth, t., Dorset, **Eng.**; on S. cst., E. of Poole Harbour; seaside resort; conference ctr.; p. (1971) 153,425.

Bournville, garden sub. founded by George Cadbury (1897), 4 m. S.W. of Birmingham, **Eng.**; chocolate and cocoa wks.

Bourton-on-the-Water, v., Gloucs., **Eng.**; tourist ctr.

Bouvet I., uninhabited island in S. Atlantic belonging to **Norway**; a. about 22 sq. m.

Bovey Tracey, v., Devon, **Eng.**; ball clay excavating.

Bow or Stratford-le-Bow, Tower Hamlets, E. London, **Eng.**; 3 m. from St. Paul's.

Bow, R., Alberta, N.W. **Canada**; head of Saskatchewan R., flows through Banff Nat. Park; irrigation; 315 m. long.

Bowden, t., Gtr. Manchester, **Eng.**; p. (1971) 4,825.

Bowen, spt. N. Queensland, **Australia**; meat wks.; coke plant; p. (1966) 5,134.

Bow Fell, mtn., Cumbria, **Eng.**; at head of Borrowdale, 4 m. N.W. of Wast Water, alt., 2,960 ft.

Bowland, Forest of, W. offshoot of Pennines, Lancs., **Eng.**; between Rs. Lune and Ribble; designated a. of outstanding natural beauty; reservoirs.

Bowling, v., Dunbarton, **Scot.**; on N. bank of R. Clyde, 10 m. N.W. of Glasgow; lge. oil refinery.

Bowling Green, t., Ky., **USA**; tr. ctr. for agr. a. producing tobacco, livestock, limestone and dairy prods.; p. (1960) 28,338.

Bowness, v., Cumbria, **Eng.**; W. end of Hadrian's Wall.

Bowness, t., Cumbria, **Eng.**; on L. Windermere; tourist ctr.

Box Hill, nr. Dorking, Surrey, **Eng.**; E. of R. Mole gap through N. Downs; chalk; wooded, fine views; alt. 763 ft.

Boyle, mkt. t., Roscommon, **R.o.I.**; on R. Boyle; dairying; p. (1966) 1,789.

Boyne, R., R.o.I.; flows to Irish Sea; Battle of the Boyne (1690) fought at Oldbridge, 3 m. W. of Drogheda; salmon fishing; 80 m. long.

Cambodia. *See* **Khmer Republic**.

Camborne, t., Cornwall, **Eng.**; 11 m. S.W. Truro; old tin- and copper-mines; engin., radio-television assembly; textiles, chemicals; p. (1971) 42,029 (inc. Redruth).

Cambrai, t., Nord dep., **France**; on R. Scheldt; textiles (gave its name to cambric), agr. processing; suffered in both world wars; p. (1968) 39,922.

Cambrian Mtns., Wales; collective name for mtns. of N. and Central Wales inc. Snowdonia and Cader Idris.

Cambridge, univ. c., co. t., Cambridgeshire, **Eng.**; on Cam R.; famous univ. with residtl. colleges; leading ctr. of research-based inds.; p. (1971) 98,519.

Cambridgeshire, non-met. co., **Eng.**; low-lying, sloping from E. Anglian **Heights** in S.E. to Fens in N.; crossed by Rs. flowing to Wash; rich soils aid intensive agr. and mkt. gardening; inc. former cos. of Huntingdon, Peterborough and Isle of Ely; cb. t. Cambridge; a. 1,316 sq. m.; p. (1971) 505,000.

Cambridge, c., Mass., **USA**; 3 m. from Boston; seat of Harvard Univ. and MIT; mftg.; impt. research ctr.; now inc. in Boston met. a.

Cambuslang, par., Lanark, **Scot.**; dyeworks, hosiery, engin., plate mill; on Clyde R.

Camden, inner bor., N. London, **Eng.**; inc. Hampstead, Holborn, and St. Pancras; p. (1971) 200,784.

Camden, c., N.J., **USA**; pt. of entry on Delaware R., opposite Philadelphia; comm., mftg. and residtl.; iron foundries, chemicals, shipbldg.; p. (est. 1969) 109,000; now inc. in Philadelphia met. a.

Camden Town, industl. and residtl. dist., London, **Eng.**; N.E. of Regent's Park.

Camembert, v., **France**; 32 m. S.E. of Caen; C. cheese.

Camerino, t., central Italy; in Appennines; univ., cath.; the anc. Camerium.

Cameroon, United Rep. of, unitary st. (1972) W. **Africa**; on G. of Guinea; comprises Eastern Cameroun (former UN trust terr. under Fr. admin.) and Western Cameroun (former UN trust terr. under Brit. admin.); fed. cap. Yaoundé; timber, cocoa, palm kernels, palm oil, groundnuts, bananas, coffee; a. 183,591 sq. m.; p. (est. 1969) 5,680,000.

Cameroon Mtn., volcano, massif, Cameroon; cstl.

mtn., hgst. in W. Africa; last eruption 1922; alt. 13,350 ft.

Campagna di Roma, Latium, **Italy;** malarial coastal plain around Rome; now reclaimed and used for pasture.

Campania, region, S. **Italy;** comprising provs. Avellino, Benevento, Caserta, Naples, Salerno; admin. and comm. ctr. Naples; high p. density; fertile; intensive agr.; p. (1969) 5,159,038.

Campbelltown, t., N.S.W., **Australia;** dairy and poultry ctr.; proposed as satellite t. for Sydney; p. (1966) 22,812.

Campbeltown, royal burgh, spt., Kintyre, Argyll, Scot.; distilling, fishing; p. (1971) 5,960.

Campeche, spt., S.E. **Mexico;** on G. of Campeche; gives its name to prov. (a. 21,660 sq. m.; p. (1969) 239,000); clothing; exp. timber, sisal, hemp; p. (est. 1969) 44,000.

Campina Grande, t., Paraiba, **Brazil;** agr.; textiles, veg. oils; p. (est. 1968) 157,149.

Campinas, t., **Brazil;** 55 m. N. of São Paulo; coffee; machin.; rubber gds.; p. (est. 1968) 252,145.

Campine or **Kempenland,** region in Limburg and Antwerp provs., **Belgium;** concealed coalfield in heathland a.

Campobasso, t., cap. of C. prov., S. **Italy;** agr. ctr.; famed for cutlery; 15th cent. cas.; p. (est. 1967) 33,800.

Campo Belo, t., Minas Gerais st., **Brazil;** impt. cattle ctr. nr. L. formed by Furnas Dam on Rio Grande; p. (est. 1968) 30,810.

Campo Duran, terr., **Argentina;** oil-field and refining.

Campos, c., Rio de Janeiro st., **Brazil;** ctr. for rich agr. region; sugar-refining; p. (est. 1968) 389,045.

Campos do Jordão, t., **Brazil;** alt. 5,570 ft.; health resort, known as the Switzerland of Brazil; p. (est. 1968) 19,676.

Campsie Fells, range of hills, Stirling, **Scot.;** highest point, 1,894 ft.

Campulung, t., **Romania,** in Walachia, at foot of Transylvanian Alps; summer resort; p. (1963) 22,696.

Canada, indep. st., within Commonwealth; occupies N. part of **N. America;** enclave of Alaska (USA) in N.W.; second lgst cty. in world, consisting of 10 provs., 2 terrs.; coastal mtns. and Rockies in W., interior plains in ctr., Hudson Bay lowlands in N., plateau a. of Quebec and Newfoundland in E.; many Is. off Arctic cst.; continental climate, severe in interior but moderated on csts.; less than 8 per cent of total land a. classified as cultivated land but agr. prods. (especially wheat) very valuable exp.; enormous forest resources but many economically inaccessible; fur trapping in N., impt. fishing inds. in both Pac. and Atl. csts.; considerable mineral resources; lgst. world producer of asbestos, silver, nickel, zinc.; major oil and gas resources in Alberta; one of most urbanised cts. in world; p. concentrated along E.–W. axis in S. parts of W. provs. and along Gr. Ls. and St. Lawrence lowland; economy highly integrated with USA; 80 per cent of mftg. inds. based on US investment and 70 per cent of external tr. with USA; major cultural differences between English and French communities; both nat. languages official (30 per cent p. speak French); cap. Ottawa; a. 3,851,809 sq. m.; p. (est. 1972) 21,815,978.

Canada Dam, Bihar, **India;** on R. Mayurakshi, 160 m. from Calcutta.

Canadian Coast Range, mtns., B.C., W. **Canada;** penetrated by deep inlets (fjords) with very little cst. plain; crossed only by R. Skeena in N., R. Fraser in S.

Canadian R., S.W. **USA;** trib. of Arkansas R., not navigable but impt. for irrigation; 900 m. long.

Canadian Shield (Laurentian Shield), **Canada;** vast region of hard anc. rock surrounding Hudson Bay, deeply eroded by ice, and lake covered; mng. and forestry.

Canal du Centre, canal, **France;** links Rhône–Saône valley at Chalon-sur-Saône with R. Loire at Digoin; serves Le Creusot coalfield; l. 60 m.

Canal Zone, Panama; strip of land leased to USA since 1903 for Panama Canal; a. 648 sq. m. (276 sq. m. water); p. (1960) 42,122.

Canaries Current, ocean current; flows S. along N.W. cst. of **Africa** from Casablanca to C. Verde; relatively cold and has very marked cooling effect on Saharan coastlands.

Canary Is., or Canaries, N. Atl. Oc.; gr. of 7 volcanic Is. belonging to Spain, 60 m. off cst. Africa; inc. Tenerife (the lgst. I.), Gran Canaria, La Palma, Gomera, Hierro, Fuerteventura, Lanzarote; dry sunny climate and impressive volcanic landscape encourage tourism; intensive, irrigated agr. for bananas, tomatoes, oranges and vegetables; cap. Las Palmas; a. 2,808 sq. m.; p. (1962) 967,177.

Canberra, Australian Capital Territory, **Australia;** in Gr. Dividing Range (highest point Mt. Bimberi, 6,268 ft.) 198 m. S.W. of Sydney; planned (1911) as seat of govt. of Commonwealth; univ.; 910 sq. m.; p. (1972) 158,594 (met. a.).

Candia. *See* Iráklion.

Cher, dep., France; cap. Bourges; crossed by Cher R.; chiefly pastoral agr.; a. 2,819 sq. m.; p. (1968) 304,601.

Cher, R., central France; rises in Central Massif, joins Loire below Tours; length 200 m.

Cherbourg, spt., Manche, France; N. cst of Contentin peninsula; opposite to and 80 m. dist. from Portsmouth; naval arsenal, shipbldg.; metals, ropes, fishing; p. (1968) 40,333.

Cheremkhovo, t., RSFSR; N.W. of Irkutsk; coal, engin., chemicals; on Trans-Siberian rly.; p. (est. 1969) 104,000.

Cherepovets, c., RSFSR; on Rybinskoye reservoir of R. Volga; steel, engin., sawmills, shipbldg.; p. (1970) 189,000.

Cheribon. *See* Tjirebon.

Cherkassy, t., Ukrainian SSR, USSR; nr. Kiev, on reservoir formed by Dnieper R.; sugar, engin., sawmilling; p. (1970) 159,000.

Cherkessk, t., RSFSR; rly. terminus, industl. ctr.; p. (1970) 76,000.

Chernigov, t., Ukrainian SSR, USSR; on Desna R.; caths.; univ.; flour, textiles, chemicals; p. (1970) 159,000.

Chernogorsk, t., RSFSR; 10 m. N.W. of Abakan; ctr. of Minusinsk coal-mng. basin; p. 51,000.

Chernovtsy, t., Ukrainian SSR, USSR; univ.; Greek cath.; wheat, dairy produce, textiles, engin., chemicals; p. (1970) 187,000.

Chernyakhovsk, (Insterberg), t., Lithuanian SSR, USSR; chemicals, textiles; p. (1963) 29,000.

Cherrapunji, t., Assam, India; in Khasi Hills; reputed wettest place in world, average annual rainfall 500 in.

Chertsey, t., Surrey, Eng.; on S. bank of R. Thames, 4 m. below Staines; residtl.; aircraft components, cement; p. (1971) 44,886.

Cherwell, R., trib. of Thames, nr. Oxford, Eng.; length 30 m.

Chesapeake Bay, inlet on Atl. cst., USA; extending 200 m. from mouth of Susquehanna R. to C. Charles; shellfish ind.; bridge-tunnel (opened 1964) spans entrance to Bay.

Chesham, t., Bucks., Eng.; in heart of Chiltern Hills; printing, textiles, lt. engin.; residtl.; p. (1971) 20,416.

Cheshire, non-met. co., N.W. Eng.; lowland a. drained by Rs. Dee and Mersey, bounded by Pennines in E.; dairying and mkt. gardening; chemical ind. based on salt deposits around Northwich; heavy inds. in and around Warrington; much of co. residtl. for Liverpool and Manchester; cap. Chester; a. 897 sq. m.; p. (1971) 865,000.

Cheshire, t., Conn., USA; agr.; formerly copper, and barytes mined; p. (est. 1967) 42,900.

Cheshunt, t., Herts., Eng.; in Lea valley, 7 m. S. of Hertford; bricks, mkt. gardening, horticulture; p. (1971) 44,947.

Chesil Bank, Dorset, Eng.; shingle ridge enclosing the Fleet lagoon running from I. of Portland to Bridport.

Chester, c., Cheshire, Eng.; at head of estuary of R. Dee; cath., anc. walls and old timbered houses; engin., metal gds.; old pt.; p. (1971) 62,696.

Chester, t., Penns., USA; on Delaware R., S.W. Philadelphia; called Uppland by Swedish settlers 1643, renamed by William Penn; pt. of entry; shipbldg.; p. (est. 1969) 61,000.

Chesterfield, mkt. t., colly. dist., Derbys., Eng.; on Rother R.; 8 m. S. of Sheffield; variety of heavy inds.; 14th-cent. church with crooked spire; p. (1971) 70,153.

Chesterfield Inlet, arm of Hudson Bay, Canada; 250 m. by 25 m.

Chester-le-Street, t., Durham, Eng.; clothing, confectionery, sand wkg.; p. (1971) 20,531.

Cheviot Hills, range between Scot. and Eng.; hgst. summit, the Cheviot, 2,676 ft.

Cheyenne, t., cap. of Wyo., USA; cattle-ranching dist.; rly. ctr.; p. (1960) 43,505.

Cheyenne, R., S.D., USA; trib. of Missouri; irrigation; length 500 m.

Chiana, Val di, valley, central Italy; separates Tuscan hills from central Apennines; occupied by upper course of R. Arno, middle course of R. Tiber; followed by main route from Florence to Rome.

Chiang Mai, c., cap of C. prov., and 3rd c. of Thailand; rly. terminus on Ping R.; tr. ctr.; teak; p. (1964) 65,736.

Chiapa, R., flows N. from Guatemala through Mexico to G. of Campeche; impt. routeway in lower course; length 200 m.

Chiapas, Pac. st., Mexico; mtnous., forested; bananas, tobacco, sugar and cocoa; cattle; close associations with Guatemala; cap. Tuxtla-Gutierrez; a. 28,729 sq. m.; p. (1960) 1,210,870.

Chiatura, t., Georgian SSR, USSR; impt. manganese deposits; p. (1963) 25,000.

Chiasso, frontier t.; S. Switzerland; rly. sta. on Italian border.

Chiba c., cap. of C. pref. Japan; part of Keihin conurb. on Tokyo B.; tr. ctr., giant shipyard, oil refining, aluminium, chemicals, iron and steel; airpt.; p. (est. 1969) 456,000.

Chicago, c., Ill., USA; on S. shore of L. Michigan; second lgst. US c.; economic heart of Mid-West; comm. ctr. called "The Loop"; immense tr. by rail and Gr. Ls.; univs.; grain mills, meat packing plants, iron and steel wks., major iron-ore mkt., electronic equipment, furniture; lgst. airpt. in world; p. (1970) 3,322,855 (c.), 6,892,509 (met. a.).

Chichester, t., West Sussex, Eng.; on S. cst. plain, 11 m. W. of Arundel; cath.; yachting basin; p. (1971) 20,547.

Chikamauga Creek, USA; branch of Tennessee R. above Chattanooga, forming part of Tenn. Valley Authority scheme; Civil War battles; site of Nat. Park.

Chickerell, E. Dorset, Eng.; 3 m. N.W. of Weymouth; site of nuclear power sta. on shores of East Fleet R.

Chiclayo, c., Lambayeque dep., Peru; mkt. ctr. for irrigated desert a. between Andes and Pac. Oc. producing mainly rice and sugar; p. (est. 1969) 134,100.

Chicopee, t., Mass., USA; on Connecticut R. nr.

Springfield; hardware, carpets, cars; p. (1960) 61,553.

Chicoutimi, t., Quebec, **Canada**; pt. on Chicoutimi R.; lumber, pulp, paper; hydroelectric power; p. (1971) 32,890.

Chiemsee, L., lge. lake nr. Munich, **W. Germany**; 1,500 ft. a.s.l.

Chieti, t., cap. of C. prov., S. **Italy**; cath.; anc. Teate Marrucinorum; Europe's lgst. glass plant, using methane from Abruzzi field; p. (1969) 53,324.

Chignecto Bay, inlet of Bay of Fundy, **Canada**; bordered by C. isthmus.

Chigrik, t., Uzbek SSR, **USSR**; new t. (1963) 21 m. S. of Tashkent.

Chigwell, t., Essex, **Eng.**; on borders of Epping Forest; Hainault Estate now incorporated in Redbridge, Greater London; residtl.; p. (1971) 53,620.

Chihli, Gulf of. *See* Pohai.

Chihauhua, lgst. st. in **Mexico**; dry climate impedes agr.; mng., cotton, cattle, Chihuahua dogs; a. 95,376 sq. m.; p. (1969) 1,826,000.

Chihuahua, c., cap. Chihuahua st., **Mexico**; univ., cath.; ctr. of silver-mng. ind.; p. (1970) 363,850.

Chikchi, peninsula, **RSFSR**; world's first Arctic nuclear power sta. being built.

Chikugo, t., N. Kyushu, **Japan**; lgst. coalmines in country.

Chilaw, t., **Sri Lanka**; ctr. of coconut plantations.

Chile, rep., **S. America**; extends between Andes and Pac. for 2,600 m. to C. Horn, E. to W. 250 m.; Atacama desert; Spanish language; Roman Catholic; similar climate to that of Argentina but lacks space for extensive agr., current programme of land reform; dairying, sheep, wool; ch. exp. nitrates, copper, iron ore, coal, iodine, petroleum, paper; cap. Santiago; ch. pt. Valparaíso; a. 285,133 sq. m.; p. (est. 1969) 9,566,000.

Chillán, t., cap. of Nuble prov., **Chile**; destroyed 1939 by one of world's worst recorded earthquakes; since rebuilt; agr. and comm. ctr.; p. (1961) 82,947.

Chiloé, I. and S. prov., Chile; cap, San Carlos, earthquakes 1939 and 1960; ch. pt. Ancud destroyed 1960; heavy rainfall, tropical forest; a. 9,058 sq. m.; p. (1960) 98,662.

Chilpancingo de los Bravos, t., cap. of Guerrero st., **Mexico**; ctr. of pre-Aztec culture; p. (1960) 12,673.

Chiltern Hills, chalk escarpment, Oxon., Bucks., Beds., and Herts., **Eng.**; cut by no. of impt. gaps used by main communications; sheep and barley; hgst. point 904 ft. nr. Wendover.

Chimborazo, mtn., **Ecuador**, Andes; extinct volcano, 20,610 ft.

Chimbote, spt., **Peru**; steel, iron-ore, coal; tinned fish, fish-meal; p. (1961) 59,990.

Chimkent, t., Kazakh SSR, **USSR**; in W. foothills of Tien Shan; nearby oasis fed by Arys R.; major industl. ctr.; lead smelting; p. (1970) 247,000.

China, People's Republic of, Asia; second lgst. cty. of world; anc. conservative civilisation overthrown by long civil war and establishment of communist régime (1949); lge. p. crowded on cultivable valleys of Hwang-Ho (Yellow R.), Yangtze and Si-kiang in E.; rest of cty, either mtnous. (plateau of Tibet) or desert (Sinkiang); rapid economic growth following onset of communist régime; agr. organised on commune basis, becomes increasingly intensive in S. where climate is less extreme; vast mineral resources, many undeveloped; recent industl. growth; heavy inds. at Wuhan, Paotow and in N.E. (Manchuria); poor communications except in E.; cap. Peking; a. 4,300,000 sq. m.; p. (1970) 685,220,000.

China Sea, part of W. Pacific between Korea and Philippines; divided by the narrow Formosa Strait into two areas; E. China Sea, inc. Yellow Sea, and S. China Sea.

Chinandega, mkt. t., cap. of C. dep., **Nicaragua**; cotton, sugar, bananas; iron wks.; p. (1967) 36,885.

Chinchow (Jinzhou), c., Liaoning prov., **China**; cement, glass, bricks, tiles, paper and wood pulp, oil; p. (1953) 352,000.

Chindwin, R., Burma; ch. trib. of Irrawaddy; rises in Patkai Hills, navigable in rainy season; densp . in lower reaches; 500 m. long.

Chinghai (Tsinghai), prov., W. **China**; between Sinkiang and Tibet, inc. C. plateau; local coal and iron-ore but exploitation hindered by isolation; two new iron and steel plants; a. 278,380 sq. m.; p. (est. 1957) 2,050,000.

Chingola, t., **Zambia**; copper mng.; metal prod. printing; p. (1963) 52,350.

Chinkiang (Zhenjiang), c., Kiangsu, **China**; former treaty pt., Yangtse R., 48 m. below Nanking; tr. ctr.; p. (1953) 201,400.

Chinon, t. Indre-et-Loire, central **France**; on R. Vienne, industl.; ruined cas., once a royal residency; nuclear power sta.; p. (1968) 8,035.

Chinqui, volcano, **Panama**; 11,410 ft.

Chinwangtao (Qinhuangdao), c., spt., former treaty pt., Hopeh, N. **China**; on Yellow Sea cst. 150 m. N.E. of Tientsin; only gd. natural harbour on N. China cst.; exp. coal from Kailan mines; p. (1953) 186,800.

Chioggia, spt., cath. t., N. **Italy**; on I. in G. of Venice; fishing; p. (1961) 47,151.

Chios (Khios) I., in Aegean Sea, **Greece**; mainly agr.; wines, fruits and figs; supposed birthplace of Homer; p. (1961) 62,090.

Chippenham, Wilts., **Eng.**; mkt. t. on R. Avon; rly. signal and brake equipment, bacon curing, tanning; p. (1971) 18,662.

Chipping Campden, v. Gloucs., **Eng.**; in Cotswold Hills; formerly impt. for woollens; tourism.

Chipping Norton, mkt. t., Oxford, **Eng.**; nr. Banbury; formerly impt. for woollens; p. (1971) 4,763.

Chipping Sodbury, mkt. t., Avon, **Eng.**; 8 m. N.E. of Bristol; p. (1971) 67,040 (dist.).

Chirchik, c., Uzbek SSR, **USSR**; 20 m. N.E. Tashkent; engin., chemicals; hydroelec. power stas.; p. (1970) 108,000.

Chiricahua Mtns., Arizona, **USA**; form part of Coronado Nat. Forest; long inhabited by Apache Indians; spectacular volcanic scenery; alt. 9,795 ft.

Chirk, t., Clwyd, **Wales**; on R. Cleriog, S. of Wrexham; slate, former coal-mng. a.; cas.

Chislehurst. *See* Bromley.

Chistyakovo. *See* Torez.

Chita, c., rly. ctr., Siberia, **RSFSR**; on upper R. Ingoda. 400 m. E. of L. Baykal; coal, engin., chemicals, sawmilling; p. (1970) 242,000.

Chittagong, c., **Bangladesh**; main pt. on Karnafuli R., nr. Bay of Bengal; exp. jute, tea; oil refining; steel mill; hydroelec. power; p. (1969) 437,000.

Chittaranjan, t., Bihar, **India**; new t. on Barakhar R., in steel ctr. of Damodar valley; rly. locomotive wks.; p. (1961) 28,957.

Chkalov. *See* Orenburg.

Choisy-le-Roi, t., Val-de-Marne dep., **France**; industl. sub. of Paris on R. Seine; p. (1968) 41,711.

Cholet, t., Maine-et-Loire, **France**; textile ctr. on R. Seine; p. (1968) 41,711.

Cholon (Cho Lon), t., **S. Vietnam**; 10 m. S.W. of Saigon; ctr. of rice tr.; soap, cigarettes, brewing; p. inc. Saigon (1968) 1,682,000.

Cholula, anc. c. of Puebla prov., **Mexico**; Aztec temple, pyramid of Cholula, and other remains.

Chomo Lhari, mtn., Tibet, **China** and **Bhutan**; sacred to Buddhists; part of Himalayas; alt. 23,997 ft.

Chomutov, t., N. **ČSSR**; industl. ctr. of lignite mng. a.; coal, steel, glass; p. (1967) 38,000.

Chooz, t., Ardennes, **France**; pressurised water reactor; nuclear power sta. linked with Belgian grid.

Cho Oyu, mtn., between **Nepal** and Tibet, **China**; sixth hgst. in world; alt. 26,967 ft.

Chorley, t., N. Lancs., **Eng.**; on W. flank of Rossendale Fells, 7 m. S.E. of Preston; cotton, engin.; expansion as new t. with Leyland (50,000 acres); p. (1971) 31,609.

Chorleywood, t., Herts., **Eng.**; nr. Watford; p. (1971) 8,427.

Chorrilos Pass, Argentina; in E. cordillera of Andes at alt. 14,655 ft.; used by rly. from San Miguel de Tucumán to Antofagasta.

Chorzów (Królewska Huta), t. Upper Silesia, **Poland**; coal, iron and steel, chemicals, engin.; p. (est. 1969) 151,300.

Chota Nagpur, plateau, Madhya Pradesh, **India**; produces lac; impt. mng. ctr.; bauxite, mica.

Chou Kou Tien, site nr. Peking, **China**; discovery of fossil bones of Peking man (*Sinanthropus pekinensis*).

Christchurch, t., Dorset, **Eng.**; on S. cst. 5 m. E. of Bournemouth; holiday resort, aircraft, lt. inds.; p. (1971) 31,373.

Christchurch, c., Canterbury dist., S.I., **N.Z.**; comm. ctr. for lamb, wool, and grain; cath., univ.; airpt; p. (1971) 165,198 (c.); (est. 1970) 260,200 (met. a.).

Christianshåb, Danish settlement on Disko Bay, W. **Greenland**; meteorological sta.

Christmas I., in Indian Oc., Australian terr. since 1958; a. 62 sq. m., healthy climate, phosphate deposits; p. (1966) 3,381.

Christmas I., Ige coral atoll in Pac. Oc., one of Line Is.; discovered by Cook 1777; a. 52 sq. m; nuclear test site, 1957–64.

Chu, R. Kazakh SSR, **USSR**; rises in Tien Shan, flows N.W. for 500 m. into inland drainage basin; Chumysh Dam provides hydroelectricity and water for intensive cultivation under irrigation of cotton, sugarbeet, citrus fruits.

Chuanchow (Quanzhou), c., Fukien prov.; **China**; former pt. now silted up; p. (1953) 107,700.

Chubut, R., **Argentina**; drains from Andes into Atl. Oc.; continual irrigation reducing soil fertility of valley; 400 m. long.

Chuchow (Zhuzhou), c., Hunan prov., **China**; on Siang R.; rly. p. (1953) 127,000.

Chudleigh, mkt. t., Devon, **Eng.**; on R. Teign; stone quarrying.

Chu-kiang (Canton R. or Pearl R.), Kwangtung, S. **China**; one of most impt. waterways of China; 110 m. long, from Kuangchow to Hong Kong; fertile delta known as "land of fish, rice, and fruit"; around Kuangchow network of elec. drainage and irrigation stas., built since 1959; R. estuary now silting.

Chukotskiy, peninsula, **USSR**; extreme N.E.; rich gold deposit; hunting.

Chukyo, industl. area, Honshu, **Japan**; centred on Nagoya; textiles, ceramics, chemicals.

Chula Vista, t., Cal., **USA**; agr., aircraft; p. (1960) 42,034.

Chungking (Zhongqing), c., S.E. Szechwan prov., **China**; on Yangtze R.; comm. ctr. W. China; ctr. of rich agr. dist. of Red Basin of Szechwan; coal, iron and steel, heavy machin., lorries, vans, chemical fertilisers; former treaty pt.; p. (1957) 2,121,000.

Chuquibamba Mtns., (alt. 21,000ft.), **Peru.**

Chuquicamata, t., N. **Chile**; 10,000 ft. in Andes; lgst copper mine in world; p. (1960) 30,476.

Chur (Coire), t., cap. Graubünden, **Switzerland**; in valley of upper Rhine; historic bldgs.; fruit, wine, tourist ctr.; p. (1969) 30,900.

Church, sub. of Accrington, Lancs., **Eng.**; engin.; p. (1971) 5,310.

Churchill, R., formerly Hamilton R., flows into Hamilton inlet, cst. of Labrador, **Canada**; magnificent waterfall, Churchill Falls with lge. hydroelec. scheme.

Church Stretton, mkt. t., Shrops., **Eng.**; tourism.

Chusan, I., and archipelago off E. cst. **China**; ch. ctr. Tinghai on Chusan I.; rich off-shore fishing grounds.

Chusovoy, t., **RSFSR**; in Urals; iron and steel; p. 60,000.

Chuvash ASSR, aut. rep., **RSFSR**; in middle Volga valley; arable agr., lumbering, food processing; a. 7,107 sq. m.; p. (1970) 1,224,000.

Chysauster, Cornwall, **Eng.**; prehistoric v.

Cibao, lowland a., **Dominican Rep.**, Central America; extends along N. side of Cordillera de Cibao for 100 m.; 10–35 m. wide; early a. of Spanish settlement; E. part called Vega Real; richest agr. a. of Hispaniola; cacao, tobacco, maize; dense p.; ch. t. Santiago.

Cicero, t., Ill., **USA**; adjoins Chicago; electrical appliances, hardware; p. (1960) 69,130.

Ciechanów, t., **Poland**; 49 m. N.W. of Warsaw; agr. inds.; p. (1965) 21,000.

Cienaga, spt., N. **Colombia**; exp. cotton, bananas, cacao; p. (1969) 142,893.

Cienfuegos, t., **Cuba**; sugar, tobacco; picturesque; p. (1960) 99,530.

Cieszyn, t., Katowice prov., **Poland**; part of former Teschen on Polish side of frontier with **CSSR**; p. (1965) 24,000.

Cimpina, t., **Romania**, in Walachia; petroleum ctr.; oil pipeline links to Ploiesti and Constanta on Black Sea.

Cincinnati, c., Ohio, **USA**; route and comm. ctr. on terraces of Ohio R.; food processing and many varied inds.; univs.; p. (1970) 448,492 (c.), 1,373,225, (met. a.).

Cinderford, t., Gloucs., **Eng.**; former ctr. of coal-mng. a. of Forest of Dean; new lt. industl. estate.

Cinque Ports, confederation of anc. Eng. pts. on cst. of Kent and Sussex; original 5: Sandwich, Dover, Hythe, Romney, Hastings; Winchelsea, and Rye added later. *See* **L23.**

Cirencester, t., Gloucs., **Eng.**; the Roman Corinеum; former woollen t.; p. (1971) 13,022.

Ciskei, Bantu Terr. Authority, **S. Africa**; established 1961 between Fish and Kei Rs. on S.E. cst.; self-gov. (1972); cap. Zwelitsha; p. (1970) 527,159.

Citta di Castello, walled t., **Italy**; in upper Tiber valley; impt. in Roman times; Renaissance cath., palaces; p. (1961) 37,413.

Citta Vecchia (Mdina), c., central **Malta**; former cap.; Roman remains; cath.

Ciudad Bolivar, c., Bolivar st., **Venezuela**; pt. on Orinoco R.; formerly called Angostura; coffee, cattle; ctr. of new industl. development on lower Orinoco; p. (1969) 103,663.

Ciudad Juarez, c., **Mexico**; comm. ctr. on USA border; agr. processing; tourism; p. (1970) 436,054.

Ciudad Madero, t., **Mexico**; styrene and detergent plants, oil refining.

Ciudad Obregón, t., Sonora, **Mexico**; on Yaqui R.; ctr. of irrigated agr. a.; p. (1970) 466,531 (met. a.).

Ciudad Real, c., cap. of Ciudad Real prov., **Spain**; mkt. t. founded 1255; textiles; p. (1961) 36,000.

Ciudad Real, prov., central **Spain**; mostly at 2,000 ft.; covering la Mancha dist.; agr.; cap. C.R.; a. 7,622 sq. m.; p. (1961) 583,948.

Ciudad Rodrigo, old fortress t., Salamanca prov., **Spain**; strategic position nr. Portuguese bdy.; in Peninsular War fell to Fr. (1810) and captured by Wellington (1812); p. (1960) 12,981.

Civitavecchia, t., Latium, **Italy**; pt. for Rome on Tyrrhenian cst., 30 m. N. of mouth of R. Tiber; p. (1961) 38,138.

Clackmannan, smallest co., **Scot.**; flat in Carse, hilly elsewhere; co. t. Alloa; coal, textiles (esp. woollens), metal work, brewing, distilling, agr.; a. 54·5 sq. m.; p. (1971) 45,546.

Clacton-on-Sea, t., Essex, **Eng.**; on E. cst. 12 m. S.E. of Colchester; seaside resort; lt. inds.; residtl.; p. (1971) 37,942.

Clairvaux, v., Aube, **France**; famous Cistercian abbey.

Clamart, t., Hauts-de-Seine, **France**; sub. of S.W. Paris; p. (1968) 55,299.

Clare, co., Munster, **R.o.I.**; cstl. co. bounded in S. and E. by R. Shannon; mainly agr. and tourism; inc. cliffs of Moher; Shannon airpt. and tax-free industl. development scheme; co. t. Ennis; a. 1,294 sq. m.; p. (1966) 73,539.

Clare I., Clew Bay, Mayo, **R.o.I.**

Clarence, R., N.S.W., **Australia**; length 240 m.

Clarence Strait, between Melville I. and Darwin, N.T., **Australia.**

Clarksburg, t., W. Va., **USA**; industl. ctr. for coal-mng. a., oil and natural gas fields; machin., glass, pottery; p. (1960) 28,112.

Clarksdale, t., Miss., **USA**; processing ctr. for rich farming a.; p. (1970) 21,105.

Clarksville, t., Tenn., **USA**; on Cumberland R.; tobacco mkt.; p. (1960) 22,021.

Clausthal-Zellerfeld, t., Lower Saxony, W. **Germany** in Harz mtns.; tourism.

Clay Cross, t., Derbyshire, **Eng.**; former ctr. coal-mng. (first developed by George Stephenson 1838) iron, engin.; p. (1971) 10,153.

Clayton-le-Moors, t., Lancs., **Eng.**; nr. Blackburn; textile machin., cotton and blanket weaving, bristles, soap; p. (1971) 6,760.

Clear C., southernmost point of Ireland, Clear I., **R.o.I.**; off S.W. cst. of Cork.

Cleare, c., Alaska, **USA**; site of ballistic missile early warning sta.

Clearwater, t., Fla., **USA**; citrus fruit, flowers, fish; resort; p. (1960) 34,653.

Cleator Moor, t., Cumbria, **Eng.**; former colly. t.

Cleckheaton, t., West Yorks., **Eng.**; nr. Bradford; woollens, blankets, asbestos.

Clee Hills, Shrops., **Eng.**; between Rs. Severn and Teme; alt. 1,800 ft.

Cleethorpes, t., Humberside, **Eng.**; 3 m. S. of Grimsby; resort; p. (1971) 35,785.

Clent Hills, Hereford and Worcs., **Eng.**; about

10 m. S.W. of Birmingham, overlooking valley of R. Stour; recreation; maximum alt. 1,036 ft.

Clerkenwell, industl. dist., London, **Eng.**; immediately N. of the City; noted for watchmkg.

Clermont-Ferrand, c., cap. Puy-de-Dôme dep. central **France**; in Auvergne; rubber tyres, chemicals, food inds.; Gothic cath., Romanesque church; p. (1968) 148,896 (c.), 204,699 (met. a.).

Clevedon, t., Avon **Eng.**; at mouth of R. Severn; seaside resort; quarrying, bricks, footwear; p. (1971) 14,285.

Cleveland, c., Ohio, **USA**; impt. Gr. Ls. pt. handling iron ore and coal which support a major iron and steel ind.; oil refining, food processing, many varied inds.; univ.; p. (1971) 738,956 (c.), 2,064,194 (met. a.).

Cleveland, non-met. co., N.E. **Eng.**; heavy industl. region centred around ts. of Tees estuary; chems., iron and steel mftg.; inc. part of N. York Moors to S.; a. 225 sq. m.; p. (1971) 567,000.

Cleveland Hills, North Yorks./Cleveland, **Eng.**; part of N. York Moors; once mined for iron ore, impt. potash deposit.

Clichy, t., Hauts-de-Seine, **France**; N.W. sub. of Paris; oil refining, aircraft, automobile components; p. (1968) 52,704.

Clifton, sub., Bristol, Avon, **Eng.**; on R. Avon; mineral springs; famous suspension bridge.

Clifton, t., N.J., **USA**; industl. t., nr. Passaic; p. (1960) 82,084.

Clinton, t., Iowa, **USA**; on Mississippi R.; iron and steel, machin.; p. (1960) 33,589.

Clitheroe, t., Lancs., **Eng.**; in Ribble valley; mkt. t. for rural a.; limestone quarrying nearby; p. (1971) 13,191.

Clonakilty, t., Cork, **R.o.I.**; nr. Bandon; sm. harbour; agr. prods.; p. (1966) 2,341.

Cloncurry, t., Queensland, **Australia**; in pastoral and copper-producing dist.; p. (1966) 2,174.

Clones, mkt. t. on Ulster border, Monaghan, **R.o.I.**; rly. ctr.; p. (1961) 2,107.

Clonmacnoise, v., Offaly, **R.o.I.**; ecclesiastical ruins.

Clonmel, t., Tipperary, **R.o.I.**; on R. Suir; agr. ctr.; fairs; cider, footwear; p. (1966) 11,026.

Clovelly, v., Devon, **Eng.**; seaside resort.

Clowne, t., Derbys., **Eng.**; coal mng.; p. (1971) 18,869 (dist.).

Cluj, c., Romania; in Transylvania on Somesul R.; univs., historic bldgs.; industl. ctr.; p. (est. 1969) 197,902 (c.), (1966) 222,491 (met. a.).

Clutha R., longest R. of S.I., **N.Z.**, hydroelec. power; 200 m. long.

Clwyd, co., N. **Wales**; inc. most of Denbigh and Flintshire; mtnous. to S.; N. cstal. resorts inc. Colwyn Bay, Prestatyn and Rhyl; sm. coalfield; lgst t. Wrexham; a. 2,226 sq. m.; p. (1971) 358,159.

Clwyd, R., Clwyd, N. Wales; flows into Irish Sea at Rhyl; length 30 m.

Clydach, t., West Glamorgan, **Wales**; on R. Tawe, 5 m. N.E. Swansea; steel wks., nickel refineries.

Clyde, R., Lanark, S.W. Scot.; flows through industl. belt into Firth of C.; Glasgow, Greenock, Clydebank main pts.; hydroelec. stas.; twin-road tunnel under R. in Glasgow (Whiteinch–Linthouse) completed 1963; 106 m. long.

Clydebank, burgh, Dunbartonshire, **Scot.**; on Clyde adjoining Glasgow; shipbldg., sewing machin., tyres, biscuits; p. (1971) 48,300.

Clyde, Firth of, stretches from Dumbarton to Ailsa Craig, **Scot.**; Bute, Arran, Gr. and Little Cumbrae ch. Is.; 64 m. long.

Coachella Valley, arid region, S.E. Cal., **USA**; part of G. of Cal.; dates and citrus fruits under irrigation from Imperial Valley irrigation system.

Coahuila, st., **Mexico**; 3rd st. of Mexico; lies S. of Texas, bordering Rio Grande valley; main coal deposits; mnfs. impt.; irrigated agr.; cap. Saltillo; a. 55,062 sq. m.; p. (1969) 1,225,000.

Coalbrookdale, v., Shrops., **Eng.**; old coal- and iron-mines; home of iron master Abraham Darby.

Coalville, t., Leics., **Eng.**; nr. Ashby-de-la-Zouch; coal mng., engin., elastic webbing; p. (1971) 28,334.

Coast Range, mtns., **USA**; along Pac. cst.; wooded ranges causing rain shadow to E. valleys; alt. up to 2,000 ft.

Coatbridge, burgh, Lanark, **Scot.**; 10 m. E. of Glasgow; coal, iron and steel, prefabricated houses, tubes, engin.; p. (1971) 52,344.

Coats I., S. of Southampton I., Hudson Bay, Canada.

Coatzacoalcos (Puerto Mexico), spt., **Mexico**; on G. of Campeche; oil refinery; chemicals, fertilisers; p. (est. 1970) 108,818 (met. a.).

Cobalt, t., Ont., **Canada**; silver, cobalt, arsenic, nickel; p. (1961) 2,209.

Cobán, t., **Guatemala**, mkt. t.; coffee and Peruvian bark tr.; p. (1964) 38,426.

Cóbh (Queenstown), U.D., Cork, **R.o.I.**; spt. on Great I. in Cork Harbour; lge docks; H.Q. of Royal Cork Yacht Club; seaside resort; p. (1966) 5,608.

Coburg, t., Bavaria, **W. Germany**; old cas.; wickerwork, furniture, metal, machines, toy inds.; p. (1963) 43,100.

Cochabamba, dep., **Bolivia**; E. of Andes; lgst. p. concentration of Bolivia in C. basin; a. 25,288 sq. m.; p. (1962) 550,300.

Cochabamba, c., cap. of C. dep., **Bolivia**; second lgst. c. in rep.; alt. 8,389 ft.; univ., cath.; oil refining, shoes, rubber tyres, fruit-canning, modern milk plant; hydroelectric power; p. (1969) 157,000.

Cochin, spt., Kerala, **India**; on Malabar cst.; exp. coconut oil, tea; oil refining; silting pt.; p. (1961) 35,076.

Cochin China, region, formerly part of Indo-China; now roughly coincides with S. Vietnam; comprises the Mekong delta. *See* **S. Vietnam.**

Cockenzie and Port Seaton, small burgh, E. Lothian, **Scot.**; two fishing pts. on F. of Forth; p. (1971) 3,580.

Cockermouth, t., Cumbria, **Eng.**; slate, shoe mftg., plywood, concrete prods.; birthplace of Wordsworth; p. (1971) 6,356.

Cockpit Country, upland a., W. **Jamaica**; classic karst landscape forming rugged upland; some cultivation in hollows; a. 200 sq. m.; alt. 1,000–2,700 ft.

Coco, R., Honduras and Nicaragua; flows to Caribbean Sea through economically impt. valley; agr., forestry, mng.; potential as routeway; 300 m. long.

Cocos or Keeling Is., 27 coral atolls, **Indian Oc.**; since 1955 terr. of Australia; ch. prod. coconuts; strategic position S.E. of Sri Lanka, 530 m. W. of Christmas I., N.E. of Mauritius; radio and cable sta.; civil aviation marine base; German cruiser *Emden* destroyed by Australian cruiser *Sydney* on N. Keeling I. in 1914; a. 5 sq. m.; p. (1965) 675.

Coesfeld, t., N. Rhine–Westphalia, **W. Germany**; textiles, machin.; p. (1963) 20,700.

Cognac, t., Charente, **France**; cognac, bottles; p. (1968) 22,515.

Coiba I., off S. cst. of **Panama.**

Coimbatore, t., Tamil Nadu, **India**; commands Palghat Gap; varied inds. benefit from local hydroelec. power; p. (est. 1970) 405,952.

Coimbra, t., **Portugal**; cath., oldest univ. in Portugal; wine-growing; earthenware mnfs.; p. (1960) 46,313.

Colac, t., Victoria, **Australia**; nr. Melbourne; farming and dairying dist.; engin., brick-mkg.; p. (1972) 10,418.

Colchester, t., Essex, **Eng.**; pre-Roman t. of Camulodunum on R. Colne; univ.; lt. inds., engin., oyster fisheries; pt.; p. (1971) 76,145.

Cold Fell, mtn., Northumberland, **Eng**; 2,039 ft.

Cold Harbour, v., Va., **USA**; battles between Grant and Lee 1864.

Coleshill, t., West Midlands, **Eng.**; lurgi gasification plant; new colly. 1965.

Colima, mkt. t., **Mexico**; on Colima R. in fertile valley; univ.; agr. processing; p. (est. 1969) 44,000.

Colima, st., **Mexico**; on Pac. cst.; cap. Colima; pt. Manzanillo; cotton, sugar, rice, coffee; a. 2,009 sq. m.; p. (1969) 238,000.

Colima, volcano (30 m. N.E. of c.), **Mexico**, alt. 12,685 ft.

Coll, I. off cst. of Mull, Argyll, **Scot.**; agr., lobster fishing.

Collie, t., W. Australia; sub-bituminous coal; p. (1972) 5,832.

Collingwood, t., Ont., Canada; on Georgian Bay, L. Huron; shipbldg., steel; p. (1961) 8,385.

Colmar, t., cap. Haut-Rhin dep., France; ctr. of Alsace textile ind.; attractive mediaeval t.; mkt. for vineyards of dist.; p. (1968) 62,341.

Colne, t., E. Lancs., Eng.; cotton mnfs., felts; p. (1971) 18,873.

Colne, R., Essex, Eng.; oysters.

Colne, R., Eng.; trib. of R. Thames rising in Chilterns.

Colne Valley, t., West Yorks., Eng.; woollens; p. (1971) 21,188.

Cologne (Köln), c., N. Rhine–Westphalia, W. Germany; on Rhine at N. end of Rhine gorge; cath., univ.; impt. R. pt., route and comm. ctr.; eau-de-Cologne, electro-technical ind., machin., metallurgy, paper, chemicals, cars, oil refining, textiles; p. (est. 1969) 860,800.

Colombes, t., Hauts-de-Seine dep., France; mftg. sub. of Paris on R. Seine; p. (1968) 80,616.

Colombia, rep., N.W. S. America; cap. Bogotá; Andes contain most of p.; the savannahs (llanos) to S.E. are almost uninhabited; industl. employment growing; birth and death rates high in mainly tropical climate and many diseases endemic; agr. impt.; coffee, petroleum, bananas; a. 439,997 sq. m.; p. (est. 1969) 20,463,000.

Colombo, c., cap. of Sri Lanka; on W. cst.; univ.; impt. pt. (artificial) built by British; exp. tea, rubber, coconuts; p. (est. 1968) 558,500.

Colón, t., Panama; at Atl. end of Panama Canal; free tr. zone; comm. and industl. ctr.; oil refining nearby; p. (1960) 59,598.

Colonsay, I., Inner Hebrides, Argyll, Scot.; 8 m. long; ecclesiastical antiquities; p. (inc. Jura 1971) 349.

Colorado, st., USA; hgst. st. in USA; in the Rockies extending up to 14,431 ft. (Mt. Elbert), no land below 3,000 ft.; drained by headwaters of Rs. Arkansas and Colorado; major stock-rearing a.; many valuable minerals esp. uranium, radium and molybdenum; cap. Denver; a. 104,247 sq. m.; p. (1970) 2,195,887.

Colorado, plateau, Arizona, Utah, Col., N.M., USA; arid upland with spectacular scenery, inc. Grand Canyon; alt. 5,000–11,000 ft.

Colorado, R., Argentina; flows from Andes to Atl. Oc.; limited irrigation in pastoral valley; length 530 m.

Colorado, major R. of W. USA; drains 8% of USA; formed by confluence of Green and Grand Rs.; spectacular canyons inc. Grand Canyon; hydroelec. power from many dams inc. Hoover Dam; irrigation supplies intensive horticultural a. in S. section; length 1,450 m.

Colorado, R., rises N.W. Texas, USA; and flows to G. of Mexico; irrigation and power; length 970 m.

Colorado Desert, Cal., USA; inc. Imperial Valley, a fertile irrigated a.

Colorado Springs, t., Col., USA; 64 m. S. Denver; smelting; resort; p. (1970) 124,856 (c.), 228,572 (met. a.).

Colton, t. S.E. Cal., USA; fruit- and vegetable-canning; mkt. gardening; p. (1960) 18,666.

Columbia, t., Mo., USA; W. of St. Louis; st. univ.; flour, lumber; p. (1960) 36,650.

Columbia, t., st. cap. S.C., USA; in ctr. of rich farming a.; textiles, clothing; burned down in Civil War 1865; p. (1970) 111,706 (c.), 315,716 (met. a.).

Columbia, District of (D.C.); area on east bank of Potomac R., coterminus with c. of Washington, cap. of USA; a. 69 sq. m.; p. (1970) 764,000 (c.); (1968) 2,750,700 (met. a.).

Columbia, R., major R. of western N. America; rises in Rocky Mtns., B.C., flows through Washington, USA; power sources, inc. Grand Coulee Dam, Bonneville Dam; deepwater harbour at mouth; length 1,400 m.

Columbus, c., Ga., USA; at head of navigation on Chattahoochee R.; industl. and shipping ctr.; textile mills, food-processing; cotton-ginning machin.; p. (1970) 152,123 (c.), 234,288 (met. a.).

Columbus, t., Ind., USA; engin.; leather gds.; p. (1960) 20,778.

Columbus, t., Miss., USA; agr. prods.; p. (1960) 24,771.

Columbus, c., st. cap. Ohio, USA; rly. ctr.; st. univ.; machin., paper, aircraft machin., chemicals; p. (1970) 533,418 (c.), 904,725 (met. a.)

Colwyn Bay, t., Clwyd, N. Wales; on cst. 6 m. E. of Llandudno; furniture; seaside resort; p. (1971) 25,535.

Comayagüela, c., former cap. of Honduras; twin c. of Tegucigalpa from which it is separated by Choluteca R.; both cs. administered together as Central Dist.; p. (1961) 65,352.

Combe Martin, v., Devon, Eng.; 5 m. E. of Ilfracombe; seaside resort.

Comber, t., Ards, N. Ireland; linen; p. (1966) 3,925.

Como, c., N. Italy; at foot of Alps, on L. Como; oranges, olives; textiles; cath.; tourism; p. (1969) 94,379.

Como, L., N. Italy; beautiful mtn. scenery, tourism, villas; a. 56 sq. m.

Comodoro Rivadavia, spt., Chubut prov., Argentina; on San Jorge G., 550 m. S.W. of Bahia Blanca; military zone; ch. source of oil in Argentine; oil refining; p. (1960) 40,000.

Comorin, C., most S. point of India.

Comoro Is., terr. of Fr. Community, Moçambique channel, midway between Africa and Malagasy Rep.; cap. Moroni; total a. 838 sq. m.; turtle fishing; vanilla, copra, sisal, timber, perfume plants; proposed indep. 1978; p. (est. 1970) 280,000.

Compiègne, t., Oise, France; sugar mills, rope; Armistice signed between Allies and Germany 1918; Fr. surrendered to Hitler 1940; resort; p. (1968) 32,653.

Compton, t., Cal., USA; residtl. for Los Angeles; heavy engin., glass, oil refining; p. (1960) 71,812.

Conakry, c., cap. of Rep. of Guinea; impt. pt. on offshore islet; exp. iron ore and alumina; experimental fruit gardens; p. (1967) 197,267 (met. a.).

Concarneau, pt., Finistère, France; 12 m. S.E. Quimper; fisheries; p. (1968) 18,150.

Concepción, c., prov. cap., Chile; shipping ctr. through its pt. Talcahuano; univ.; comm. and cultural t.; severe earthquakes 1939 and 1960; nr. to coalfield; p. (est. 1969) 191,746.

Concepción, prov., Chile; cap. C.; Lota-Coronel coalfield, lgst. in Chile; a. 2,201 sq. m.; p. (1961) 535,633.

Concepción, t., cap. of C. prov., Paraguay; main comm. ctr. for Chaco, pt. on R. Paraguay; p. (1962) 33,886.

Conchos, R., Chihuahua prov., Mexico; flows N.E. from Madre Occidental to Rio Grande; cotton under irrigation in upper valley; hydro-elec. power; length 350 m.

Concord, t., Cal., USA; residtl. and comm. ctr. in San Francisco met. a.; rapid p. growth; p. (1960) 36,208.

Concord, t., Mass., USA; literary ctr.; textiles; p. (1960) 12,275.

Concord, t., st. cap., N.H., USA; on Merrimack R.; granite, machin., textiles; p. (1960) 28,991.

Concordia, t., Argentina; pt. on Uruguay R.; exp. agr. prod.; p. (1960) 56,000.

Condamine, R., Queensland, Australia; trib. of R. Darling; used for irrigation.

Coney I., t., N.Y., USA; on Long I., 5 m. long, comprises Manhattan Beach, Brighton Beach, W. Brighton, and W. End; seaside resort.

Congleton, t., E. Cheshire, Eng.; on S.W. margin of Pennines; clothing, textiles; once impt. for silk; p. (1971) 20,324.

Congo, People's Rep. of the, indep. st. within Fr. Community, Equatorial Africa; cap. Brazzaville; agr. and forestry; hardwoods; a. 132,000 sq. m.; p. (est. 1969) 880,000.

Congolese Republic, *See* Zaïre.

Congo R. *See* Zaïre R.

Conisborough, t., South Yorks., Eng.; limestone, bricks, tiles; p. (1971) 16,800.

Coniston, t., Ont., Canada; on rly. 8 m. E. of Sudbury; nickel smelting; t. built by and for nickel-mng. company.

Coniston Water, L., Cumbria, Eng.; focus of tourism in L. Dist.; 5·5 m. long.

Conjeeveram. *See* Kanchipuram.

Connacht, prov., R.o.I.; inc. Galway, Mayo, Sligo, Leitrim, Roscommon; mtnous. in W.; farming, fishing; a. 6,863 sq. m.; p. (1966) 401,518.

Connah's Quay, t., Clwyd, Wales; p. (1971) 12,296.

Connaught Tunnel (Can. Pac. Rly.), B.C., **Canada;** longest in N. America (5 m.) 5,000 ft. under Mt. Sir Donald (Selkirk Mtns.).

Connecticut, R., New Eng.; USA; middle course forms fine agr. land; investment in navigation, irrigation and flood control; 354 m. long.

Connecticut, st., New England, USA; one of original 13 sts.; humid climate; arable agr.; diversified inds.; many natural harbours on cst.; cap. Hartford; lgst. c. New Haven; a. 5,009 sq. m.; p. (1970) 2,987,950.

Connemara, mtns., dist., R.o.I.; Co. Galway; many lakes and bogs; tourist resort.

Conowingo Dam, Md., USA; on lower Susquehanna R.; hydroelec. power sta. supplies power to inds. in Philadelphia.

Consett, t., Durham, Eng.; on edge of Pennines, 10 m. S.W. Newcastle; iron, steel, coal mng.; p. (1971) 35,391.

Constance (Konstanz), c., Baden—Württemberg, W. Germany; on Bodensee; cath.; textiles, machin., chemicals, elec. inds.; route ctr.; tourism; p. (1963) 55,100.

Constance L. *See* Bodensee.

Constanța, ch. spt. S.E. Romania; on Black Sea; oil pipeline to Ploiesti and Cimpina; exp. petroleum, wheat; cement, chemicals, machin.; p. (est. 1969) 170,026 (c.); (1966) 202,024 (met. a.).

Constantine, c., N.E. Algeria; stands 2,130 ft. high on gorge of Rhumel R.; planned textile and engin. wks.; p. (1966) 243,558.

Constantinople. *See* Istanbul.

Conwy (Conway), Gwynedd, spt. N. Wales; mediaeval walled t.; at mouth of R. Conway; sm. seaside resort; cas.; quarrying, lt. engin.; p. (1971) 12,158.

Cook, mtn., alt. 12,349 ft.; highest point in S. Alps, **N.Z.;** 3 peaks.

Cookham, t., Berks., Eng.; on R. Thames nr. Maidenhead; tourism; p. (1971) 19,372 (dist.).

Cook Inlet, S. cst. Alaska, USA; oil pipeline connects oilfields of Granite Point with marine terminal at Drift R.

Cook Is., Brit. gr. (Rarotonga, lgst.) in S. Pac., annexed to N.Z., 1901; internal self-govt. 1965; bananas, oranges, copra; a. 93 sq. m.; p. (1966) 19,247.

Cookstown, mkt. t., l. gov. dist., N. Ireland; cement wks.; p. (1966) 5,542.

Cook Strait, channel between N. and S. Is. of N.Z.; 15–18 m. wide; undersea cable completed 1965.

Cooma, t., N.S.W., Australia; mkt. t. and pastoral ctr.; tourism; H.Q. of Snowy Mts. Authority; p. (1966) 9,101.

Coonoor, t., Tamil Nadu, India; in Nilgiri Hills; sanatorium 6,000 ft. a.s.l.; p. (1961) 30,690.

Coopers Creek (Barcoo), intermittent R., central Australia; rises in Warrego Range, Gr. Dividing Range, flows S.W. into marshes of L. Eyre; provides water for livestock in semi-arid region; 880 m. long.

Coorong, The, S. Australia; lagoon and long tongue of land on cst.

Copenhagen (København), ch. spt., cap. of Denmark; on E. cst. of Sjaelland I.; royal palace, univ., library; naval sta.; steel, metal, textiles, clothing, breweries; airpt.; p. (est. 1969) 643,262 (c.), 1,381,312 (met. a.).

Copiapó, t., cap. of Atacama prov., Chile; copper and iron-mng. ctr.; p. (1960) 37,224.

Coquet, R., Northumberland, Eng.; rises in the Cheviots and flows into North Sea.

Coquimbo, spt., Chile; exp. iron, copper, and manganese ores; p. (1962) 52,250.

Coral Sea, Pac. Oc., extends from the New Hebrides to Australia.

Coral Sea Islands Territory, Fed. terr., Australia; scattered Is., E. of Gr. Barrier Reef, off Queensland cst.; possibility of oil exploration.

Corbeil-Essonnes, t., Essonne, France; on R. Seine, 12 m. S.E. of Paris; flour mills, printing, paper; p. (1962) 27,038.

Corbridge, t., Northumberland, Eng.; on R. Tyne, nr. Hexham; 17th cent. bridge; Roman t. nearby.

Corby, t., Northants., Eng.; 7 m. N. of Kettering; new t.; steel wks., shoes, clothing, lamps; p. (1971) 47,716.

Córdoba, c., central Argentina; univ.; cultural and comm. ctr.; exp. wheat, cattle, lumber; health resort; local hydroelec. power from La Vina; p. (1960) 586,015.

Córdoba, t., Veracruz, Mexico; mkt. t. in coffee-growing a.; p. (1960) 32,883.

Córdova, prov., Andalusia, Spain; cap. Córdova; olives, vines, livestock; a. 5,299 sq. m.; p. (1961) 798,437.

Córdova, c., Andalusia, Spain; cap. of C. prov., on Guadalquivir R.; cath. originally built as a mosque in 8th cent.; tourist ctr.; p. (est. 1969) 229,407.

Corfu (Kérkira), most N. of Ionian Is., Greece; traversed by mtns. but largely lowland producing olive-oil, figs, wine, oranges; a. 246 sq. m.; p. (1961) 26,991.

Corinth (Kórinthos), t., cap. Corinthia prov., Greece; at end of Isthmus of C.; occupies site 3 m. from anc. classic c. destroyed by earthquake 1858; raisins, wine; p. (1961) 15,892.

Corinth Canal, ship canal, S. Greece; traverses Isthmus of Corinth, links G. of Corinth and Ionian Sea with Saronic G. and Ægean Sea; opened 1893; length 3·5 m., depth 26 ft.

Corinth, Isthmus of, connects the Peloponnesus with the mainland of Greece; cut across by canal.

Corinto, ch. spt., N.W. Nicaragua; handles 50 per cent of cty's tr.; exp. hides, sugar, coffee; p. (1963) 9,177.

Cork, co., R.o.I.; lgst. and most S.; mtns.; dairying, brewing, agr., fisheries; cap. Cork; a. 2,890 sq. m.; p. (1966) 339,525.

Cork, spt., C.B., Cork, R.o.I.; at mouth of R. Lee; cath., univ.; woollens, butter, cattle, brewing, cars, rubber; p. (1966) 122,146 (c.), 125,283 (met. a.).

Corner Brook, c., W. Newfoundland, Canada; gd. harbour; iron foundries, cement, gypsum; one of world's lgst. newsprint mills; p. (1971) 25,929.

Cornwall, t., Ont., Canada; on St. Lawrence R.; H.Q. of Seaway Authority; textiles, pulp, paper, flour; p. (1971) 46,429.

Cornwall, non-met. co., S.W. Eng.; penin. bordering Atl. Oc. and Eng. Channel; granite moorlands supply kaolin and tin; mild maritime climate encourages tourism, dairying, and mkt. gardening; many small fishing vs.; co. t. Bodmin; a. 1,357 sq. m.; p. inc. Isles of Scilly (1971) 379,892.

Coro, c., Falcón, Venezuela; on Paraguaná penin.; agr. processing; nearby oil refineries; p. (1961) 45,506.

Corocoro, t., La Paz dep., Bolivia; at alt. 13,000 ft. in central Andes, 50 m. S. of La Paz; impt. copper-mng. ctr.

Coromandel Coast (Carnatic region), cst. of Tamil Nadu, India; where earliest European settlements established; extensive a. of flat land built up by R. Cauvery.

Coronation Gulf, arm of Beaufort Sea; extreme point N. Canadian mainland; discovered by Franklin.

Coronel, spt., Chile; coal mng., pt. inds.; p. (1960) 60,234.

Da Lat (Dalat), t., S. Vietnam; 140 m. N.E. Saigon; in Annamite hills; nuclear reactor (1963); airport.

Dalbeattie, burgh, Kircudbright, Scot.; granite, dairy prod., gloves; p. (1971) 3,412.

Dalby, t., Queensland, Australia; p. likely to increase with development of Moonie oilfield; dairying, timber; p. (1972) 8,890.

Dalgety, t., on Fife cst., Scot.; new t. proposed p. 10,000.

Dalkeith, burgh, Midlothian, Scot.; 6 m. S.E. of Edinburgh; route ctr.; mkt. t.; p. (1971) 9,532.

Dalkey, t., Dublin, R.o.I.; on E. cst.; 4 m. N. of Wicklow border; seaside resort; residtl.; p. 5,526.

Dallas, c., Texas, USA; in cotton- and grain-growing a.; machin., aircraft, petroleum prod.; univ.; scene of assassination of President Kennedy (1963); p.) (1970) 836,121 (c.), 1,539,472 (met a.).

Dalmatia, region of Yugoslavia and prov. of Croatia, N.E. Adriatic cst.; high Karst plateaux; olive oil, wine; tourism; contains many resorts; a. 4,916 sq. m.; p. 622,000.

Daltonganj, t., Bihar, India; on R. Koël; coal, cement; p. (1961) 25,270.

Dalton-in-Furness, t., Cumbria, Eng.; limestone quarrying, textiles; abbey ruins; p. (1971) 11,217.

Daman (Damão), spt., India; 100 m. N. Bombay; fishing, ship-bldg., cotton; former Portuguese settlement; p. (1960) 22,388.

Damanhûr, t., Egypt; on W. margin of Nile delta, 25 m. S.E. of Alexandria; mkt. for local agr. produce; p. (est. 1970) 161,400.

Damaraland, region, South-West Africa; high plateau; admin. by Rep. of S. Africa; pt., Walvis Bay; cattle rearing.

Damascus (Arabic Esh-Sham), cap. c., Syria; 57 m. S.E. of its pt. Beirut; claims to be oldest continuously inhabited c. in world; metal-wk., glass, cement; univ.; p. (1970) 835,000.

Dambovitta (Dîmbovița), R., Romania; rises in Mt. Omul (Transylvanian Alps), flows S. through Bucharest to R. Danube, via impt. oilfields; 150 m. long.

Damietta (Dumyât), t., Lower Egypt; on main distributary of R. Nile delta; cotton; p. (1960) 72,000.

Dammam, spt. on Persian G., Saudi Arabia; oil pt.; planned industl. growth; p. 30,000.

Damodar R., Bihar, India; flows through India's major coalfields; valley forms ch. industl. a. of India; multipurpose scheme for hydro-electric power, irrigation and flood control.

Dampier, spt., W. Australia; on Indian Oc.; new pt. (1965) for shipping iron ore from Mt. Tom Price and Mt. Wittenoom; pelletising plant.

Dampier Archipelago, gr. of sm. Is., off N.W. Australia, in Indian Oc.

Dampier Strait, Bismarck Archipelago, channel between W. New Britain and Umboi I.

Dampier Strait, channel between West Irian and Waigeo I.

Danakil Land (Dankalia) coastal desert a., mainly in Ethiopia, but partly in Afars and Issas; includes D. depression; potash; sm. pt. and road projected.

Da-nang (Tourane), c., S. Vietnam; ch. pt. of Annam on S. China Sea; exp. agr. prod.; p. (1968) 334,229.

Danapur, t., Bihar, India; on Ganges R., nr. Patna; p. (1961) 70,766.

Danao, t., Cebu, Philippines; rice and sugar dist.; p. (1960) 32,826.

Dandenong, t., Victoria, Australia; 19 m. E. of Melbourne; growing industl. ctr.; p. (est. 1968) 28,700.

Dannemora, t., Sweden; 25 m. N.E. of Uppsala; iron ore worked since 1579; p. 1,062.

Dansalan, t., cap. of Lanao prov., Philippines; resort; p. 19,657.

Danube (Donau), R., second longest R. in Europe; rises in Black Forest, Germany, and flows E. into Black Sea; forms comm. highway; linked by canals with Main, Rhine and Oder; Vienna, Budapest, Belgrade, and other lge. cs. on its banks; 1,725 m. long.

Danube-Tisa Canal, N. Yugoslavia; irrigation, flood control, navigable; 163 m. long.

Danville, t., Ill., USA; coal; mftg tr.; p. (1960) 41,856.

Danville t., Va., USA; cotton, tobacco; p. (1960) 46,577.

Danzig. *See* Gdańsk.

Dap Cau, t., N. Vietnam; bamboo pulp and paper factories.

Darbhanga, t., Bihar, India; rice, oil-seeds, grain, sugar tr.; univ.; p. (est. 1970) 123,650.

Dardanelles, strait between European and Asian Turkey, connecting Ægean Sea with Sea of Marmara; (the anc. Hellespont), 40 m. long.

Daresbury, v., Cheshire, Eng.; birthplace of C. L. Dodgson (Lewis Carroll).

Dar-es-Salaam, spt., cap. of Tanzania; univ. college; textile mill projected; oil refining; pipeline to Ndola, Zambia; naval base and Tan-zam rly. being built with Chinese aid; p. (1970) 343,911.

Darfield, t., South Yorks., Eng.; p. (1971) 7,739.

Darien, region, Panama; tortoiseshell, pearls, gold, but agr. is basis of economy; cap. La Palma; a. 6,000 sq. m.; p. (1968) 24,100.

Darien, Gulf of, inlet of Caribbean Sea; separates Colombia and Panama.

Darjeeling, hill t., W. Bengal, India; tea, quinine; Himalayan resort; p. (1961) 40,651.

Darkhan, new t., Mongolia, on R. Hara; industl.

Darlaston, t., West Midlands, Eng.; nuts, bolts, fabricated steel mnfs., drop forgings, car components; p. (1961) 21,732.

Darling Downs, plateau, S.E. Queensland, Australia; grazing region; ch. t. Toowoomba.

Darling R., N.S.W., Australia; longest trib. of the Murray, forming part of the Murray–Darling Rs. scheme for irrigation and flood control; 1,702 m. long.

Darlington, t., Durham, Eng.; bridge bldg., woollen yarn mnf., engin., rly. wagons, steel wks.; p. (1971) 85,889.

Darmstadt, c., Hesse, W. Germany; cas.; comm. ctr.; metallurgical prods., paper, machin., radio, chemicals, plastics; technical univ.; p. (est. 1969) 140,200.

Dart, R., Devon, Eng.; rises in Dartmoor, flows S. into English Channel at Dartmouth; picturesque estuary; 46 m. long.

Dartford, t., Kent, Eng.; nr. S. cst. of Thames estuary; Dartford–Purfleet road tunnel (1963); engin., chemicals, quarrying, paper; mkt.; p. (1971) 45,670.

Dartmoor, high granite plateau, S.W. Devon, Eng.; rough moorland; sheep, cattle, and wild ponies; granite tors; Nat. Park; tourism; granite quarries, reservoirs; prison at Princetown; a. 225 sq. m.; highest point High Willays, 2,039 ft.

Dartmouth, spt., S. Devon, Eng.; on W. of estuary of R. Dart; Royal Naval College; pottery; yachting, holiday resort; p. (1971) 5,696.

Dartmouth, industl. spt., sub. of Halifax, Nova Scotia, Canada; oil refining, shipbldg.; p. (1971) 64,002.

Darton, t., South Yorks., Eng.; nr. Barnsley; coal mng.; p. (1971) 15,145.

Darvel, burgh, Ayr, Scot.; on R. Irvine, 8 m. E. Kilmarnock; p. (1971) 3,209.

Darwen, t., N.E. Lancs., Eng.; on flank of Rossendale Fells, 3 m. S. of Blackburn; tile and glaze bricks, paint, wallpaper, plastics; p. (1971) 28,880.

Darwin, c., spt., N.T., Australia; international airpt. serves Frances Creek iron ore mines; brewing, ice-cream, meat wks.; p. (1972) 35,281.

Daryal Gorge, Caucasus, Georgian SSR, USSR; deep gorge (5,900 ft.) cut by Terek R.; identified as the classical Caspian or Iberian Gates from which distances were reckoned; forms part of Georgian military road.

Dashava, settlement on Lvov oblast, W. Ukraine, USSR; ctr. of rich natural gas field and starting point of gas pipeline to Kiev and Moscow, built after second world war.

Datia, t., Madhya-Pradesh, India; stone-walled, palaces; p. (1961) 29,430.

Datteln, t., N. Rhine–Westphalia, W. Germany; coal, leather, iron; p. (1963) 31,200.

Daugavpils, t., Latvian SSR, USSR; on Dvina R.; textiles, engin., rly. repair wks., food prods.; p. (1970) 101,000.

Dauphiné Alps, mtn. range, S.E. France; 24 peaks over 10,000 ft.

Daura, t., nr. Baghdad, Iraq; oil refining.

Davao, t., Mindanao, Philippines; pt. for sugar; p. (est. 1968) 337,000 (met. a.).

Davenport, t., Iowa, USA; on Mississippi R. where it is spanned by bridges to Rock Island, Molise and East Molise; rly., comm. and industl. ctr.; p. (1970) 97,614 (c.), 358,917 (met. a.).

Daventry, t., Northampton, Eng.; 9 m. S.E. of Rugby; boot-mkg., lt. engin.; wireless-transmission sta.; expanded t.; p. (1971) 11,813.

David, t., cap. of Chiriqui prov., Panama; timber, coffee, cacao, sugar; p. (1960) 22,924.

Davis Strait, channel between Greenland and Baffin I., N.W. Terr., Canada; connects Atl. Oc. with Baffin Bay; navigable.

Davos-Platz and **Dörfli**, ts., Grisons, Switzerland; Alpine winter resorts; alt. 4,845 ft.; p. (1960) 9,259.

Dawley, t., Shropshire, Eng.; on S.E. flank of the Wrekin; ironwks., pipe, cement, roadstone, asphalt and brick wks., engin.; new t. (1963); p. (1971) 25,935.

Dawlish, t., S. Devon, Eng.; on S. cst. between estuaries of Rs. Exe and Teign; seaside resort; flower tr.; p. (1971) 9,505.

Dawson, t., Yukon Terr., Canada; on Yukon R., nr. Klondike goldfields; asbestos mng. projected 1968; p. (1966) 881.

Dax, t., Landes, S.W. France; on Adour R.; hot sulphur spring; horse mart; p. (1962) 18,422.

Dayton, c., Ohio, USA; on Great Miami R.; univ.; aircraft, elec. machin., rubber gds.; p. (1970) 239,591 (c.), 842,157 (met. a.).

Daytona Beach, t., Fla., USA; resort; shipping, ctr.; motor speed trials; p. (1960) 37,395.

De Aar, t., rly. junc., Cape Prov., S. Africa; 500 m. from Cape Town; rlys. from N.W. (Luderitz, Walvis Bay) and S.E. (Pt. Elizabeth, E. London) join Cape Town to Johannesburg trunk rly.; p. (1961) 14,357.

Dead Sea, salt-water L. between Israel and Jordan; surface 1,286 ft. below level of Mediterranean; a. 340 sq. m., l. 47·5 m., greatest width 9·5 m., greatest depth 1,309 ft.; receives waters of Jordan; high mineral content, very saline.

Deal, anc. pt., E. Kent, Eng.; on S.E. cst., 7 m. N.E. Dover; opposite Goodwin Sands; seaside resort; famous lifeboat service; p. (1971) 25,415.

Dean, Forest of, Gloucs., Eng.; between Wye and Severn Rs.; former Royal Forest; Forestry Commission plantations; former coal-mng. a.; tourism; new lt. industl. estates.

Dearborn, t., Mich., USA; birthplace of Henry Ford; p. (1960) 112,007.

Dearne, t., South Yorks., Eng.; p. (1971) 25,029.

Death Valley, depression, Cal., USA; N. of Mojave Desert, 150 m. N.E. of Los Angeles; completely arid; floor covered with saline deposits; tourist attraction; depth of valley floor 276 ft. below sea-level.

Deauville, seaside resort, Calvados dep., N. France; on Eng. Channel; racecourse, casino; p. (1968) 5,370.

Debra Markos, t., cap. of Gojam prov., Ethiopia; vegetable oil extraction; p. circa 5,000.

Debrecen, t., Hungary; 114 m. E. of Budapest; univ.; ctr. of pastoral dist.; fairs; pharmaceutics, medical instruments, furniture; ctr. of Calvinism; p. (est. 1969) 154,000.

Decatur, t. Ala., USA; steel, textiles; industl. development after establishment of Tenn. Valley Authority; p. (1960) 29,217.

Decatur, t., Ill., USA; on Sangamon R.; industl.; rly. engin., food processing; univ.; p. (1970) 89,468 (c.), 123,926 (met. a.).

Decazeville, t., Aveyron, S. France; ctr. of sm. coalfield (no longer worked), metallurgy; p. (1962) 12,032.

Deccan, The, upland of S. India, bounded by the Narbada and Kistna Rs.; coincides with Maharashtra st.; area of very fertile lava soils; impt. cotton-growing region.

Děčin, R. pt., CSSR; industl. ctr.; cas.; p. (1967) 42,000.

Dedza, t., Malawi, new t.; p. (1966) 2,261.

Dee, R., N. Wales and Cheshire, Eng.; 90 m. long; lge. silted estuary.

Dee, R., Louth, R.o.I.; flows to Dundalk Bay; 20 m. long.

Dee, R., Aberdeen and Kincardine, Scot.; picturesque, tourism; 87 m. long.

Dehiwala-Mt. Lavina, t., Sri Lanka; on cst. S. of Colombo; p. (est. 1968) 122,500.

Dehra Dun, t., Uttar Pradesh, India; scientific research ctr.; sawmills; p. (est. 1970) 137,604 (c.), 168,614 (met. a.).

Deir-ez-Zor, t., Syria; on Euphrates R.; on motor route between Damascus and Baghdad; p. (1962) 59,757.

Dej, t., Romania; on Somesul R., distillery; p. (1963) 22,827.

Delabole, v., Cornwall, Eng.; on N.W. flank of Bodmin Moor; slate quarries.

Delagoa Bay, natural harbour, **Moçambique;** ch. pt. Lourenço Marques.

Delaware, st., USA; low-lying a. of Atl. cst. plain; agr., lumber; fertilisers, minerals, leather, chemicals, machin.; cap. Dover; ch. pt. Wilmington; a. 2,370 sq. m.; p. (1970) 542,979.

Delaware Bay, inlet, Atl. cst., **USA;** drowned estuary of R. Delaware, extends 80 m. inland from C. May into heart of highly industl. a. of Philadelphia.

Delaware R., flows between N.Y. st., **USA** along the Penns. border, through N.J. to Delaware Bay; 315 m. long.

Delft, c., pt., S. Holland, Neth.; on Schie R. (canalised), nr. Rotterdam; technical univ.; ceramics (delft-ware), tool mftg., precision instruments; 13th cent. Old church and 15th cent. New church; p. (1968) 80,545.

Delhi, c., cap. of India; on watershed between Rs. Indus and Ganges; made up of Old Delhi with walls, palace, and fort, and New Delhi with admin. ctr.; univ.; p. (1971) 3,600,000.

Delhi, union terr., India; hot and arid region between Indus valley and alluvial plain of Ganges; irrigation to support agr.; New Delhi and Old Delhi ch. ctrs.; a. 578 sq. m.; p. (1971) 4,044,338.

Dieppe, pt., Seine-Maritime, **France**; 35 m. N. of Rouen; fisheries, shipbldg., machin.; cross-Channel ferry; p. (1968) 30,404.

Differdange, t., S.W. **Luxembourg**; iron ore; cattle; p. (1960) 17,637.

Digboi, N.E. Assam, **India**; oil fields and refinery; p. (1961) 35,028.

Digne, t., cap. of Alpes-de-Haute-Provence, **France**; nr. Aix; cath.; p. (1962) 13,660.

Dijon, c., cap. Cote-d'Or, E. **France**; the Roman Divonense castrum; route ctr.; Seine-Saône watershed; wine tr.; industl. ctr.; univ., cath.; casino; p. (1968) 145,357 (c.), 183,989 (met. a.).

Dili, t., cap. of Portuguese **Timor**; major spt.; exp. cotton, copra, coffee, p. (1960) 52,158.

Dillingen, t., Bavaria, **W. Germany**; on R. Danube, heavy inds.; p. 6,500.

Dimitrovgrad, t., **Bulgaria**; founded 1947; fertilisers, chemicals, superphosphate plant, iron, thermo-electric sta.; p. (1965) 41,787.

Dimitrovo. *See* **Pernik**.

Dinajpur, t., **Bangladesh**; comm. ctr.; univ.; p. (1961) 37,711.

Dinan, t., Brittany, **France**; mediaeval t. above Rance R.; hosiery, brewing; holiday resort; p. (1968) 9,901.

Dinant, t., Namur, **Belgium**; on R. Meuse; mkt. t., tourist resort; exported copperware (*dinanderie*) in Middle Ages; cath., citadel (1040); p. (1968) 9,901.

Dinard, t., Brittany, **France**; resort, especially for English; p. (1968) 9,162.

Dinaric Alps, mtn. range, **Yugoslavia, Albania** and Italy (Trieste); extend 400 m. along Adriatic; hgst. peak Durmitor, 8,245 ft.

Dindigul, t., Tamil Nadu, **India**; 25 m. S. of Tiruchirapalli; cigars, tobacco; p. (1961) 92,947.

Dingle B., Kerry, R.o.I.; long inlet of sea on Atl. cst.

Dingle, t., D. peninsula, Kerry, **R.o.I.**; agr. mkt.; creamery, fishing.

Dingwall, royal burgh, Ross and Cromarty, **Scot.**; at head of Cromarty F.; rly. junc.; cattle mkt., admin. ctr.; distilling, handloom weaving; p. (1971) 4,232.

Dinslaken, t., N. Rhine–Westphalia, **W. Germany**, N. of Duisburg; coal, steel, iron, footwear, timber; oil pipeline from Wesseling under construction; p. (1963) 46,400.

Diomede Is., two barren granitic islets in Bering Strait between Alaska and Siberia; accepted bdy. between Soviet and US terr.

Diredawa, t., **Ethiopia**; 25 m. N. of Harar; rly. wks.; mkt. and comm. ctr.; p. 48,800.

Dirk Hartog I., off Shark Bay, W. **Australia**.

Disko I., off W. cst. of **Greenland** in Baffin Bay; contains harbour of Godhavn, cap. N. Greenland; rendezvous for whalers; shrimp beds; a. 3,200 sq. m.

Dismal Swamp, morass, S. Va. and N.C., **USA**; contains L. Drummond and extends 30–40 m. S. from nr. Norfolk.

Diss, Norfolk, Eng.; mkt. t. on R. Waveney, 28 m. S.W. of Norwich; agr. implements; p. (1971) 4,477.

Distaghil, major peak, Gr. Karakoram, N. Kashmir, **Pakistan**; two summits connected by a ridge, max. alt. 25,868 ft.

Distrito Federal, federal dist., **Brazil**; inc. cap. c. of Brasilia; a. 2,245 sq. m.; p. (1967) 142,000.

Ditchling Beacon, 6 m. N. of Brighton, East Sussex, **Eng.**; highest point of South Downs, 813 ft.

Diu, spt., I., off S. cst. of Bombay, **India**; oil nearby at Kayakov; a. 20 sq. m.; p. (1960) 14,271.

Diwāniyah, Ad, t., **Iraq**; cap. D. prov.; on Baghdad–Basra rly.; p. (1965) 181,000 (met. a.).

Diyarbakir, c., cap. of D. prov., central **Turkey**; on Tigris R.; comm. and mnf. ctr.; flour and rice mills; the anc. Amida, old walls, gates, citadel; p. (1965) 102,653 (c.), 163,691 (met. a.).

Djajapura (Sukarnapura), t., cap. of West Irian, **Indonesia**; on Humboldt B., an inlet of Pac. Oc.

Djakarta (Batavia), c., cap. of **Indonesia**, N.W. Java; comm. ctr.; textiles; exps. rubber, tea; printing; airport; p. (est. 1969) 2,978,052 (c.), 4,750,000 (met. a.).

Djambi, dist., and t., Sumatra, **Indonesia**; on E.

cst. plain 100 m. N.W. of Palembang; oil-field; a. (dist.) 17,345 sq. m.; p. (1961) 744,381 (dist.), 113,080 (t.).

Djerba, t. and I., **Tunisia**, at S. entrance to G. of Gabès, joined to mainland by causeway; olives, dates, textiles, pottery; a. 197 sq. m.; p. 62,000.

Djibouti, c., cap. of **Afars and Issas**; rly. terminus; main pt.; p. (1969) 61,500 (met. a.).

Dneprodzerzhinsk, t., Ukrainian SSR, **USSR**; W. of Dnepropetrovsk on Dnieper R.; iron and steel, engin., chemicals; hydroelec. sta. nearby; p. (1970) 227,000 (c.), 239,000 (met. a.).

Dnepropetrovsk (abbrev. Dnieper hydroelectric sta.), Ukrainian SSR, **USSR**; nr. Zaporoz'ye, on Dnieper; lgst dam and power sta. in Europe; destroyed by Germans, rebuilt 1944–9.

Dnepropetrovsk, c., Ukrainian SSR, **USSR**; on R. Dnieper; univ.; impt. rly. and industl. ctr., using iron ore (from Krivoy Rog), coal (Donbas), manganese (Nikopol) and electric power from Dnieper dam; heavy machin., chemicals; p. (1970) 863,000 (c.), 918,000 (met. a.).

Dneprorudnyy, t., Ukrainian SSR, **USSR**; new t. on S. shore of Kakhvota reservoir; p. (1964) 6,000.

Dneprostroy. *See* Zaporoz'ye.

Dnieper (Dnepr), gr. R. of Ukrainian SSR, **USSR**; 3rd longest R. of Europe; rises in Valdai hills, flows into Black Sea, 1,400 m. long; connected by canals to Baltic; tribs. inc. Berezina, Pripet, Desna, Orel, Samara; since erection of Dneproges dam navigable for almost entire length.

Dniester (Dnestr), R., Ukraine SSR, **USSR**; rises in Carpathians and flows into the Black Sea; 877 m. long.

Döbeln, t., Leipzig, **E. Germany**; machin., metallurgy, wood, cigar and sugar inds.; p. (1965) 28,639.

Dobrich. *See* Tolbukhin.

Dobruja, historic region, S.E. **Europe**; along Black Sea cst., S.E. Romania, and N.E. Bulgaria; mainly agr.; ch. pt. Constanta; p. (1963) 517,016.

Dobšiná, t., **ČSSR**; cave containing ice-field of 2 acres; asbestos, iron ore; p. 5,300.

Doce, R., **Brazil**; flows to Atl. Oc.; 400 m. long.

Dodecanese (S. Sporades), gr. of some 20 Greek Is. (originally 12) in S. Ægean Sea; most impt. are Rhodes, Cos, and Leros; Italian 1912–46; p. (1961) 122,346.

Dodoma, mkt. t., **Tanzania**; 250 m. W. of Dar-es-Salaam on central Tanganyika rly. to Kigoma; also on main N. to S. motor road.

Dodworth, t., South Yorks., **Eng.**; nr. Barnsley; coal; p. (1971) 4,551.

Dogger Bank, sandbank in N. Sea, between England and Denmark; depth varies from 6 to 20 fathoms; valuable fishing ground; action between British fleet under Beatty and German fleet under Hipper; *Blücher* sunk Jan. 1915.

Dogs, I. of, riverside dist., formed by bend in the R. Thames off Greenwich, London, **Eng.**; Millwall and India docks, shipbldg. yards.

Doha, t., cap. of **Qatar**; spt. on E. of Qatar peninsula, Persian Gulf; p. (est. 1970) 80,000.

Dokai Bay, inlet, N. Kyushu, **Japan**; landlocked bay on S. side of Shimonoseki straits; flanked by highly industl. zone inc. Yawata, Wakamatsu, Tobata cs.; requires constant dredging; l. 4 m., width 0·5–1·5 m.

Dôle, t., Jura, E. **France**; on R. Doubs, nr. Dijon; industl. ctr.; anc. cap. of Franche-Comté, ceded to France in 1678; birthplace of Pasteur; p. (1968) 28,774.

Dolgarrog, sm. t., Gwynedd, **Wales**; site of hydroelectric sta.

Dolgellau, t., Gwynedd, N. Wales; agr., quarrying, timber; p. (1971) 2,564.

Dollar, burgh, Clackmannan, **Scot.**; at foot of Ochil hills; p. (1971) 2,280.

Dollar Law, mtn., nr. Peebles, **Scot.**; alt. 2,680 ft.

Dolomites, gr. of limestone mtns., S. Tyrolese Alps, N.E. **Italy**; tourist dist.; peaks assume fantastic forms; principal peak Marmolada 11,000 ft.

Dominica, W.I., most N. of Windward Is.; 25 per cent under cultivation; volcanic soils highly suitable for bananas; N.–S. mtn. range has spectacular volcanic scenery; cap. Roseau; Ass. St. within Brit. Commonwealth (1967); a. 290 sq. m.; p. (1968) 70,177.

Dominican Rep., rep., **W.I.**, shares I. of Hispaniola with Haiti; comprises Nat. Dist. (inc. cap. Santo Domingo) and 25 admin. provs.; mtnous. with sub-tropical climate; in path of tropical cyclones; comm. economy mainly agr.; transport system geared to exp. of sugar; govt. investment in agr. and mng.; oil refining at Nigua; tourism growing; official language Spanish; a. 18,699 sq. m.; p. (1970) 4,324,760.

Domodossola, frontier t., Piedmont, N. **Italy**; nr. Alpine tourist resort in Toce valley, nr. Simplon.

Don, R., South Yorks., **Eng.**; trib. of R. Ouse, 70 m. long.

Don, R., Aberdeen, **Scot.**; flows into N. Sea; salmon; 82 m. long.

Don, major R. of southern **RSFSR**; falls into Sea of Azov below Rostov, its ch. pt.; navigable to Voronezh; ch. trib., Donets; access to Volga by Don-Volga canal; fisheries; 1,222 m. long.

Donaghadee, t., Ards, **N. Ireland**; nearest point to Scot.; spt. and seaside resort; p. (1966) 3,649.

Donauwörth, t., W. Bavaria, **W. Germany**; bridge t. on N. bank of Danube at Wörnitz confluence; p. circa 9,500.

Donawitz, t., Styria prov., **Austria**; lignite, iron and steel; p. circa 18,000.

Donbas, industl. region, Ukrainian SSR, **USSR**; in valleys of Rs. Donets and lower Dnieper; about 9,000 sq. m.; produces 60 per cent of Russia's coal; adjoins Krivoy Rog ironfields; many lge. industl. ts.

Doncaster, t., South Yorks., **Eng.**; on Don R. 17 m. N.E. of Sheffield; coal mines, tractors, nylon mftg.; racecourse; p. (1971) 82,505.

Donegal, spt., Co. Donegal, **R.o.I.**; on W. cst., on Donegal Bay; homespun tweeds, carpets; p. (1966) 1,507.

Donegal, (Tirconnail), co., N.W. **R.o.I.**; fishing, poor agr.; cloth, hydroelectric power; co. t. Lifford; a. 1,865 sq. m.; p. (1966) 108,486.

Donets, R., rises in uplands of central **RSFSR**, N.E. of Belgorod, flows S.E. to join R. Don; crosses Donets coalfield; length 650 m. *See* Donbas.

Donetsk (Stalino), t., Ukrainian SSR, **USSR**; industl. ctr. of Donets coal basin; iron, steel, engin., chemicals; p. (1970) 879,000 (c.), 890,000 (met. a.).

Donges, t., Loire Atlantique, **France**; nr. St. Nazaire; oil refinery; synthetic textiles, plastics.

Dongola, t., **Sudan**; on left bank of Nile above Third Cataract; Old D. was 75 m. to S.; p. 15,000.

Donner Pass, E. Cal., **USA**; highway pass through Sierra Nevada at 7,135 ft.

Donzère-Mondragon, Vaucluse, **France**; site of Rhône barrage supplying hydroelectric power.

Doon, R., Ayr, **Scot.**; flows from Loch Doon to F. of Clyde; 26 m. long.

Dora Baltea, R., N. **Italy**; rises in Mt. Blanc, flows E. and S. through Val d'Aosta to R. Po at Chivasso; impt. routeway from N. Italy to Switzerland (through Gr. St. Bernard Pass) and France (through Little St. Bernard Pass); 95 m. long.

Dora Riparia, R., **Italy**; trib. of R. Po, flowing from Cottian Alps past Turin; 60 m. long.

Dorchester, co. t., Dorset, **Eng.**; mkt. t. on R. Frome; lime, agr., engin.; Roman remains; nearby prehistoric Maiden Castle; linked with the name of Thomas Hardy; p. (1971) 13,737.

Dordogne, dep., S.W. France; cap. Périgueux; crossed by Dordogne R.; fertile valleys; p. (1968) 374,073.

Dordogne, R., S.W. **France**; rises in Central Massif, joins Garonne to form Gironde; vineyards; upper reaches used for hydroelectric power.

Dordrecht, c., nr. Rotterdam, **Neth.**, on R. Merwede; timber, shipbldg., seaplanes; p. (1968) 88,461.

Dorking, t., Surrey, **Eng.**; on R. Mole to S. of gap through N. Downs; mkt., residtl; lt. inds.; p. (1971) 22,354.

Dormagen, t., N. Rhine–Westphalia, **W. Germany**; petrochemicals, artificial fibres.

Dornbirn, t., Vorarlberg, **Austria**; textiles; p. (1961) 28,075.

Dornoch, burgh, Sutherland, **Scot.**; N. of Dornoch F.; resort; p (1971) 838.

Dorset, non-met. co., S. **Eng.**; borders Eng. Channel along attractive cliffed cst. formed by E.–W. limestone ridges; Portland stone quarried; many tourist resorts inc. Bournemouth; mkt. ts. serve agr. interior; a. 1,025 sq. m.; p. (1971) 553,000.

Dorset Heights, hills, extend E. to W. across central Dorset, **Eng.**; chalk; pastoral farming, sheep; some cultivation where soil is deep enough; rise to 800–900 ft.

Dorsten, t., N. Rhine–Westphalia, **W. Germany**; on R. Lippe; coal, iron, elec., chemical inds.; p. (1963) 37,600.

Dortmund, c., N. Rhine–Westphalia, **W. Germany**; on Dortmund–Ems Canal; industl. ctr. and pt. of Ruhr; coal, iron, steel, machin.; p. (est. 1969) 647,000.

Dortmund–Ems Canal, N. Rhine–Westphalia, **W. Germany**; links Dortmund on Ruhr coalfield with R. Ems 5 m. above Lingen; coal, iron-ore traffic; 90 m. long.

Douai, t., Nord, **France**; nr. Lille on Scarpe R.; coal, iron and engin. wks.; bell founding, arsenal; p. (1968) 49,187 (t.), 205,432 (met. a.).

Douala, spt., **Cameroon**; rly. to Yaoundé; exp. hardwoods; p. (1970) 250,00 (met. a.).

Douarnenez, spt., Finistère, N.W. **France**; on D. Bay; sardine fisheries; p. (1968) 20,184.

Doubs, dep., E. **France**; traversed by Jura range and R. Doubs; mainly agr.; watchmkg., motor vehicles; cap. Besançon; a. 2,052 sq. m.; p. (1968) 426,363.

Douglas, t., cap. of I. of Man; 75 m. W. of Liverpool, **Eng.**; spt.; seaside resort; p. (1966) 19,517.

Douglas Point, on shore of L. Huron, Ont., **Canada**; nuclear power sta.

Dounreay, Caithness, **Scot.**; fast-breeder nuclear reactors.

Douro, R., **Portugal** and **Spain**; enters Atl. Oc. below Oporto; known as Duero R. in Spain; length 485 m.; famous port wine a.

Dove, R., Derbys. and Staffs., **Eng.**; trib. of Trent; flows through beautiful dales; 48 m. long.

Dovedale, valley, Derbys., **Eng.**; steeply sloping limestone ravine of R. Dove; tourism.

Dover, packet pt., Kent, **Eng.**; one of old Cinque pts.; nearest spt. to France, the Strait of D. being only 21 m. wide; ch. pt. for passenger and mail traffic with Continent; cas.; p. (1971) 34,322.

Dovey, R., **Wales**; flows from Cambrian Mtns. and enters Cardigan Bay by a wide estuary.

Dowlais, dist., Merthyr Tydfil, Mid Glamorgan, S. Wales; coal mng., iron founding, engin.

Down, former co.; l. gov. dist., **N. Ireland**; borders Strangford Lough and Dundrum Bay; agr. and fisheries; p. of former co. (est. 1971) 310,617.

Downham Market, t., Norfolk, **Eng.**; on R. Ouse; flour-milling malting, sheet-metal wks.; p. (1971) 3,608.

Downpatrick, t., Down, **N. Ireland**; on R. Quoile; linen; p. (1966) 4,291.

Downs, natural harbour of refuge for shipping between Kent cst. and Goodwin Sands in the English Channel.

Downs. *See* **North Downs, South Downs.**

Drachenfels, mtn. peak on the Rhine, **W. Germany**; the steepest of the Siebengebirge range, nr. Königswinter; alt. 1,065 ft.; ascended by lt. rly.; famous cave of legendary dragon.

Draguignan, t., cap. of Var. dep., S.E. **France**; mkt. t., service ctr.; p. (1962) 16,085.

Drakensberg, mtn. chain between Natal and Orange Free State, **S. Africa**, and Lesotho; extending 500 m. from Gt. Fish R. to Olifants R.; hgst. peak Mont-aux-Sources 10,763 ft.; rly crosses range by Van Reenen Pass.

Drama, pref., Macedonia, **Greece**; cap. Drama; a. 1,353 sq. m.; p. (1961) 120,936.

Drammen, spt., **Norway**; nr. Oslo, on the Drammen R.; shipyard; exp. timber, wood-pulp, paper; p. (1968) 47,827.

Drancy, t., Seine-St. Denis, **France**; N.E. sub. of Paris; p. (1968) 69,528.

Drava (Drau), R., trib. of Danube, Austria and Yugoslavia; flows from the Tyrol across Carinthia and Styria, joining Danube nr. Osijek; length 450 m.; used for hydroelectric power.

Drenthe, prov., **Neth.**; on German frontier; cap. Assen; a. 1,028 sq. m.; p. (1968) 354,124.

Dresden, c., **E. Germany**; R. pt. on Elbe, 50 m. E. of Leipzig; impt. route ctr.; engin., chemicals, optical and photographic apparatus, porcelain, glass, brewing; fine art collections; scientific research; oil pipeline from Schwedt under construction; p. (est. 1969) 500.726 (c.). 635,000 (met. a.).

Driffield, t., Humberside, **Eng.**; on Yorks. Wolds 13 m. N. of Beverley; oil-cake wks.; p. (1971) 7,899.

Drin, R., N. **Albania**; rises in Yugoslavia and flows through deep gorges into Adriatic; hydroelec. power; 180 m. long.

Drina, R., trib. of Sava R., **Yugoslavia**; ch. source of hydroelec. power in rep.; 300 m. long.

Drøbak, spt., S.E. **Norway**; winter pt. for Oslo; summer resort; p. (1961) 2,735.

Drogheda, spt., Louth, **R.o.I.**; considerable tr. in agr. produce, salmon, etc.; stormed by Cromwell in 1649; p. (1966) 17,823.

Drogobych, t., Ukrainian SSR, **USSR**; 40 m. S.W. of Lvov; ctr. of lge. oilfields, refineries; mftg.; p. (est. 1968) 56,000.

Droitwich, t., Hereford and Worcs., **Eng.**; brine baths, salt wks., wireless-transmission sta.; lt. inds.; expanded t.; p. (1971) 12,766.

Drôme, dep., S.E. **France**; traversed by Alps and watered by Rs. Rhône, Drôme, and Isère; cap. Valence; agr., forestry, sericulture, textile ind.; a. 2,533 sq. m.; p. (1968) 342,891.

Dromore, mkt. t., Banbridge, **N. Ireland**; on Lagan R.; linen; p. (1966) 2,081.

Dronfield, t., Derbys, **Eng.**; between Chesterfield and Sheffield; edged tools, engin. and agr. implements; p. (1971) 17,826.

Droylsden, t., Gtr. Manchester, **Eng.**; sub. of Manchester; chemicals; textiles; p. (1971) 24,134.

Drumochter Pass, Grampian Mtns., Scot.; carries main Perth to Inverness rly. from Glen Garry into valley of R. Spey; highest alt. reached by any main rly. in Gt. Britain, 1,484 ft.

Dschang, t., **Cameroon**; quinine processing; bauxite mng.

Dubai (Dubayy), emirate, one of **United Arab Emirates**, Arabian Gulf; recently developed as free pt. (modelled on Singapore), major comm. ctr. of a.; offshore oil with vast underwater storage tanks; international airpt.; deepwater pt. (Port Rashid) under construction; p. (est. 1970) 70,000.

Dubbo, t., N.S.W., **Australia**; on Macquarie R., timber, wool, flour, meat wks.; p. (1966) 15,568.

Dublin, co., **R.o.I.**; co. t. Dublin; a. (inc. c. of Dublin) 356 sq. m.; p. (1966) 795,047.

Dublin (Irish *Baile Atha Cliath*), C.B., cap. of **R.o.I.**; co. t. Co. Dublin; at mouth of R. Liffey; ctr. of govt., commerce, ind., and culture; cath., univ., Abbey Theatre; brewing, distilling, food processing; Swift was buried here; p. (1966) 568,271 (c.), 650,153 (met. a.).

Dutch Harbour, t., Unalaska I., Aleutian gr., N. Pac. Oc.; strategic American naval base.

Dvina or Northern Dvina, R., RSFSR; flows to White Sea at Arkhangelsk, formed by the junction of Rs. Sukhona and Vychegda at Kotlas; connected by canal with Neva and Volga; used for timber transport; 465 m. long.

Dvina or Western Dvina, R., Latvian SSR, RSFSR, USSR; rises in Valdai Hills nr. sources of Volga and Dnieper, flows through Latvia to G. of Riga; connected by canal to Berezina and Dnieper; c. 635 m. long.

Dyfed, co., S.W. Wales; inc. former cos. of Cardiganshire, Carmarthenshire and Pembroke; upland a. crossed by valleys of Teifi and Towy Rs.; stock rearing and fattening; tourism impt. around cst.; industl. in S.E.; a. 2,226 sq. m.; p. (1971) 314,452.

Dzaudzhikau. *See* Ordzhonikidze.

Dzerzhinsk, c., RSFSR; R. pt. on Oka; chemicals (fertilisers, explosives); p. (1970) 221,000 (c.), 273,000 (met. a.).

Dzhalil, t., RSFSR; new t. 30 m. N.E. of Almetyevsk to serve new oilfield there.

Dzhambul, c., Kazakh SSR, USSR; on Talas R. and on Turk–Sib rly.; chemicals, food-processing; p. (1970) 188,000.

Dzhezkazgan, t., Kazakh SSR, USSR; 350 m. W. of L. Balkhash; copper-mines; manganese ore nearby; p. (est. 1967) 58,000.

Dzierzoniow (Reichenbach), t., Wroclaw, S.W. Poland; mnf. ctr.; textiles, machin., elec. equipment; formerly in Germany; p. (1970) 32,900.

Dzungaria, inland basin, Sinkiang prov., N.W. China; lies between Tien-Shan highlands of Soviet–Chinese frontier and Altai mtns.; former historic kingdom of Zungaria.

E

Ealing, outer bor., Greater London, Eng.; comprising former bors. of Acton, Ealing, and Southall; p. (1971) 299,450.

Earby, t., Lancs., Eng.; cotton, plastics, cloths, agr. machin.; p. (1971) 4,816.

Earl's Court, residtl. a., London, **Eng.**; Bor. of Kensington and Chelsea, contains E.C. exhibition hall.

Earn, R., Perth, **Scot.**; issues from Loch Earn (6·5 m. long) and flows into Tay R.; 46 m. long.

Easington, Durham, **Eng.**; colly. v.; now part of Peterlee new t.; p. (1971) 85,410 (dist.).

Easington, v., Humberside, **Eng.**; nr. Hull; natural gas terminal.

East Anglia, comprises Norfolk and Suffolk, **Eng.**; former Anglo-Saxon kingdom; one of Britain's most productive agr. regions.

East Anglian Heights, hills, extend S.W. to N.E. across N.E. Hertfordshire, N. Essex, and S.W. Suffolk, **Eng.**; chalk overlain by glacial clays and sands; smooth, rolling surface; region of lge farms and lge fields, mixed farms mainly grain; rarely exceed 600 ft.

East Barnet. *See* Barnet.

East Berghołt, v., Suffolk, **Eng.**; birthplace of Constable.

Eastbourne, t., East Sussex, **Eng.**; on S. cst. to E. of Beachy Head; seaside resort; p. (1971) 70,495.

East Cape, extreme N.E. point of Asia; on Chukchi peninsula, **RSFSR**; Russian name Cape Dezhnova.

East Cape, extreme E. point of **N.Z.**, named by Cook on his first voyage in 1769.

East Chicago, t., Ind., **USA**; L. Michigan; iron and steel wks., oil refining; p. (1960) 57,669.

East Cleveland, t., Ohio, **USA**; residtl.; p. (1960) 37,991.

East Dereham, t., Norfolk, **Eng.**; 14 m. W. of Norwich; agr. implements; p. (1971) 9,391.

Easter Island, S. Pac. Oc., 2,350 m. W. of Chile; various theories to explain origin of gigantic statues; p. circa 850.

Eastern Province, Zambia; groundnuts, maize, tobacco; prov. ctr. Fort Jameson; a. 22,350 sq. m.; p. (1964) 507,000.

East Grinstead, t., West Sussex, **Eng.**; in ctr. of Weald, 9 m. W. of Tunbridge Wells; agr. mkt.; famous hospital for plastic surgery; p. (1971) 18,569.

East Ham. *See* Newham.

East Hartford, t., Conn., **USA**; industl.; p. (1960) 43,977.

East Indies, name commonly applied to Is. between S.E. Asia and N. Australia, variously known as Malay archipelago, Malaysia, Indonesia.

East Kilbride, t., N. Lanark, **Scot.**; 7 m. S.S.E. of Glasgow; new t. 1947; lge agr. machin., aero engines, engin., elec. gds.; seawater distillation plant; knitwear, clothing; p. (1971) 63,502.

East Lansing, t., Mich., **USA**; residtl.; univ.; p. (1960) 30,198.

Eastleigh, t., Hants., **Eng.**; rly. engin., many new inds.; p. (1971) 45,320

East London, spt., C. Prov., **S. Africa**; at mouth of Buffalo R.; holiday resort; trading ctr.; inds. inc. car assembly, textiles, engin.; titanium deposits nearby; p. (1970) 123,294 (met. a.).

East Lothian (Haddington), co., S.E. **Scot.**; cereals, potatoes, sheep, coal; co. t., Haddington, a. 267 sq. m.; p. (1971) 55,906.

East Main R., Quebec, Canada; flows into James Bay; 270 m. long.

Easton, t., Penns., **USA**; on Delaware R.; rly. ctr. coal, steel, machin., furniture; p. (1960) 31,955.

East Orange, t., N.J., **USA**; residtl. sub. of New York; p. (1960) 77,259.

East Pakistan. *See* Bangladesh.

East Point, t., Ga., **USA**; textiles, fertilisers; p. (1960) 35,633.

East Providence, t., Rhode I., **USA**; textiles, machin.; p. (1960) 41,955.

East Retford, t., Notts., **Eng.**; on R. Idle, 6 m. E. of Worksop; rubber, wire ropes, engin.; p. (1971) 18,402.

East Riding, Yorkshire. *See* Yorkshire, East Riding.

East River, tidal strait about 16 m. long and from 600 to 4,000 ft. wide; separates the bors. of Manhattan and Bronx from the bors. of Queens and Brooklyn, N.Y., **USA**.

East St. Louis, t., R. pt., Ill., **USA**; on Mississippi R.; lge stockyards, meat-packing, aluminium, chemicals; p. (1960) 81,718.

East Sussex, non-met. co., S.E. **Eng.**; mainly rural, urban growth on cst. where resorts, retirement and dormitory ts. for London, inc. Brighton, Hastings and Eastbourne; crossed by S. Downs in S. terminating at Beachy Head, Ashdown Forest in N.; a. 693 sq. m.; p. (1971) 650,000.

Eastwood, t., Notts., **Eng.**; birthplace of D. H. Lawrence; coal; p. (1971) 10,864.

Eau Claire, t., Wis., **USA**; on Chippewa R.; agr. mkt.; food processing, varied mnfs.; p. (1960) 37,987.

Ebal, Mt., Israel; opposite Gerizim; alt. 2,986 ft.

Ebbw Vale, t., Gwent, **Wales**; 17 m. N.W. of Newport; coal, iron, tinplate, bricks, pipes, precast concrete; steel wks. to close; p. (1971) 26,049.

Eberswalde, t., Frankfurt, **E. Germany**; N.E. of Berlin; iron, wood, and cardboard wks., chemicals; p. (1965) 33,092.

Ebro, ch. R. of N.E. Spain; flows to Mediterranean from Cantabrian Mtns.; feeds hydro-electric plants, irrigation, esp. around Zaragoza; 580 m. long.

Eccles, Gtr. Manchester, **Eng.**; 4 m. W. of Manchester; chemicals, oil refining, engin.; p. (1971) 38,413.

Echo L., Tasmania, Australia; used to store water for hydroelectric power.

Echuca, t., Victoria, **Australia**; on R. Murray; rly. ctr.; irrigation wks.; dairy prods., timber; p. (1972) 7,510.

Écija, t., Seville, **Spain**; olive oil, wine, pottery; the Roman Astigi; p. (1961) 49,762.

Eckernförde, spt., Schleswig-Holstein, **W. Germany**; on Baltic, N.W. of Kiel; p. (1963) 20,400.

Ecrins, mtn. peak, S.E. **France**; hgst. point of massif du Pelvoux and Dauphiné Alps; alt. 13,461 ft.

Ecuador, rep., **S. America**; on equatorial Pac. cst., bounded by Colombia to N. and Peru to W. and S.; inc. Galapagos Is. in Pac. Oc.; lowland to E. and W. of central Andes; climate temperate in Andes and hot and humid in lowlands; comm. economy mainly agr. with impt. exp. of bananas; petroleum increasingly impt.; pipeline across Andes to pt. of Esmeraldas; communications difficult but vital for economic development; major pts. Guayaquil and Manta; official language Spanish; cap. Quito; a. inc. Galápagos Is. 175,580 sq. m.; p. (est. 1969) 5,973,300.

Edam, t., N. Holland, **Neth.**; on cst. IJsselmeer; cheese, tool mftg.; p. (1967) 16,558.

Eday, I., Orkney Is., **Scot.**; the Ocelli of Ptolemy. p. (1971) 179.

Eddystone, rock with lighthouse, Eng. Channel; 15 m. S.W. of Plymouth.

Ede, t., Gelderland, **Neth.**; livestock; pianos; p. (1968) 68,772.

Edea, t., pt., **Cameroon**; aluminium smelting based on nearby hydroelectric power plant.

Eden, Vale of, fertile belt in Cumbria, **Eng.**; between barren hills of Pennines and L. Dist.; occupied by R. Eden; mkt. ts. Appleby and Penrith.

Eder R., **W. Germany**; joins Fulda R. S. of Kassel; Eder dam lgst. in Germany.

Edessa (Edhessa), t., N.E. **Greece**; agr. tr. ctr.; the anc. Ægae, burial place of Macedonian kings; p. (1961) 15,534.

Edgehill, ridge, 15 m. S. of Warwick, **Eng.**; scene of first battle of civil war, 1642.

Edgewater, t., N.J., **USA**; sub., connected by ferry with New York; sugar refining; p. (1960) 4,113.

Edgware, N. sub. of London, **Eng.**; inc. in outer London bor. of Barnet.

Edinburgh, c., cap. of **Scot.**, co. t. of Midlothian; royal burgh on F. of Forth; univ., cas.; palace (Holyrood); printing, publishing, brewing, electronics equipment, rubber gds; Edinburgh Festival in August; Leith, with docks is joined to E.; p. (1971) 453,584.

Edirne, t., **Turkey**; in Thrace, on R. Maritsa; comm. ctr. with tr. in wine, tobacco, silk, perfume; the anc. Adrianople, named after the emperor Hadrian, later cap. of Ottoman sultans 1366–1453; p. (1965) 46,264.

Edmonton, c., cap. of Alberta, **Canada**; fast-growing c. (46 sq. m.) on both sides of N. Saskatchewan R.; high-level bridge links Strathcona; major military ctr.; univ.; international air ctr.; oilfields and farming; oil and

chemical inds.; p. (1971) 490,811 (met. a.).
Edmonton. *See* **Enfield.**
Edremit, t., Balikesir, N.W. **Turkey;** cereals, opium; silverwk.; p. (1960) 22,246.
Edward, L. *See* **Idi Amin Dada.**
Eger, t., N.E. **Hungary;** mkt. t. in wine producing region; mediaeval fortress t.; p. (1968) 44,000.
Egersund, pt., S. cst. **Norway;** fishing; mentioned in Norwegian sagas; p. (1960) 3,868.
Egham, t., Surrey, **Eng.;** on R. Thames, nr. Staines; contains field of Runnymede; residtl.; p. (1971) 30,510.
Egmont, mtn., **N.I., N.Z.;** extinct volcano; alt. 8,200 ft.
Egremont, mkt. t., Cumbria, **Eng.;** 10 m. S. of Whitehaven; limestone; former iron ore mng.
Egypt, Arab Republic of, indep. st., N.E. corner **Africa;** member of Federation of Arab Reps.; 96 per cent a. is desert except Nile valley and delta where 95 per cent of p. live; agr. depends on annual rise of Nile waters and irrigation; cereals, sugar-cane, vegetables, fruit; cotton main cash crop; phosphates; oilfield in Israeli-occupied Sinai and recent finds offshore in G. of Suez and in Western Desert; cap. Cairo; ch. spts. Alexandria, Port Said, Suez; Aswan High Dam has produced problems: (1) silting up of reservoir (L. Nasser) behind dam; (2) reduction in fertilising silt deposits in lower Nile valley; (3) erosion of Nile delta itself; (4) reduction of fish p. in E. Med.; union of Egypt with Libya proposed 1973; a. 386,000 sq. m.; p. (1971) 34,000,000.
Eider, R., W. Germany; separates Holstein from Schleswig; flows into N. Sea; 125 m. long.
Eifel, plateau of volcanic rocks, **W. Germany;** lels N. of R. Moselle, forming W. edge of Rhine gorge between Koblenz and Bonn; formerly cultivated, now largely woodland and moorland: farming in valleys; rises to just over 2,000 ft.
Eiger, mtn., one of the highest peaks of the Bernese Oberland, **Switzerland;** famous for steep N. wall; alt. 13,042 ft.
Eigg, I., Inner Hebrides, **Scot.;** 15 m. S.W. of Mallaig; basaltic rocks on cst.; rises to 1,289 ft.
Eilat, new spt., Negev, **Israel;** on G. of Aqaba; copper at Timna; oil pipeline from Ashdod (1970).
Eildon Hills, Roxburgh, **Scot.;** S. of Melrose; highest point 1,385 ft.
Eindhoven, c., N. Brabant, **Neth.;** electronic equipment, motor vehicles, tobacco and textile inds.; technical univ.; p. (est. 1969) 187,930, 331,397 (met. a.).
Eire. *See* **Ireland, Republic of.**
Eisenach, t., Erfurt, **E. Germany;** on R. Hörsel, at foot of Thuringian forest; ctr. of Werra potash field; cars, machin., textiles; birthplace of J. S. Bach; p. (1965) 50,059.
Eisenerz Alps, mtn. range, **Austria;** most N. range of Alps, overlooking Danube valley between Linz and Vienna; impt. iron-ore deposits; alt. from 6,000 to 9,000 ft.
Eisenhüttenstadt, t., Frankfurt, **E. Germany;** iron smelting; terminus of Oder–Spree canal; p. (1965) 36,619.
Eisleben, t., Halle, **E. Germany;** machin., copper- and silver-mng. ctr.; birthplace of Luther; p. (1965) 33,589.
Ekibastuz, t., Kazakh SSR, **USSR;** 75 m. S.W. of Pavlodar; ctr. of rapidly developing mng. a. coal, gold, metals; coal-fed generating plant projected to supply power to European Russia; p. 15,000.
El Alamein, v., **Egypt;** in Libyan Desert 60 m. S.W. of Alexandria, scene of Allied victory, second world war; oilfield nearby; terminal nr. Sidi Abd el-Rahman.
Elan, R., Powys, Wales; rises on S.E. sides of Plynlimon, flows into R. Wye; lower valley contains series of 4 lge reservoirs, capacity 10,000 million gallons; ch. source of water for Birmingham.
Elâzig, t., E. **Turkey;** dam and hydroelec. project at Keban, 30 m. to N.W. at confluence of E. and W. branches of Euphrates; p. (1965) 78,899.
Elba, I., off Tuscan cst., **Italy;** iron ore, wine, marble, salt; ch. t. Porto Ferrajo; Napoleon's first exile here; a. 140 sq. m.; p. (1960) 26,000.
Elbe, R., in **ČSSR** and **Germany;** rises in Riesengebirge and flows into N. Sea at Cuxhaven; navigable for 525 m. of total l. of 725 m.; connected with Rhine and Weser Rs. by Mittelland canal; forms part of border between E. and W. Germany.
Elbert, mtn., Col., **USA;** hgst. peak of Rocky Mtns. in USA, 14,431 ft.
Elbląg or **Elbing,** spt., Gdansk, **N. Poland;** shipbldg., machin., vehicles; p. (1970) 89,800.
Elbruz Mt., Caucasus, Georgian SSR, **USSR;** hgst. in Europe (18,480 ft.), over-topping Mont Blanc by 2,698 ft.; twin volcanic peaks.
Elburz, mtn. range, **N. Iran;** bordering on Caspian Sea; hgst. peak, Demavend, 18,500 ft.
El Callao, t., Bolivar st., **Venezuela;** ctr. of impt. gold-mng. region.
Elche, t., Alicante, **Spain;** palm groves; oil, soap, footwear; p. (est. 1967) 101,028.
El Dar-el-Beida (Casablanca), c., **Morocco;** pt. on Atl. Oc.; artificial harbour; fish canning, textiles; exp. phosphate; p. (1969) 1,320,000.
Eldorado, radium mine, N.W. Terr., **Canada;** on E. shore of Gr. Bear Lake nr. Arctic Circle; produces 40 per cent of world's radium, sent to Pt. Hope, Ontario, for refining.
El Dzejair. *See* **Algiers.**
Electrona, Tasmania, Australia; carbide wks. based on local limestone and hydroelec. power.
Elektrenai, t., Lithuanian SSR, **USSR;** new township nr. Vievis, at site of thermal power sta.
Elektrostal, t., **RSFSR;** 35 m. E. of Moscow; steel. engin.; p. (1970) 123,000.
Elephanta I., Bombay Harbour, **India;** Brahmanic caves with monolithic carvings.
Elephant Butte Dam, N.M., USA; on Rio Grande; built to control flood water; lake, a. 60 sq. m., supplies irrigation water to 780 sq. m. in N.M. and Texas, water also supplied to Mexico.
El Ferrol del Caudillo, spt., **Spain;** on N.W. cst.; fortfd., fishing; p. (1967) 84,866.
Elgin, royal burgh, co. t., Moray, **Scot.;** pt. Lossiemouth; woollens, whisky; ruins anc. cath.; p. (1971) 16,407.
Elgin, t., Ill., **USA;** watches, electrical equipment; p. (1960) 49,447.
Elgon Mt., extinct volcano, bdy. of **Kenya** and **Uganda;** 14,100 ft.; cave dwellings on slopes.
El Hasa, dist., **Saudi Arabia;** on Persian Gulf, ch. t. Hofuf.
Elie and Earlsferry, burgh, Fife, **Scot.;** summer resort; p. (1971) 895.
Elisabethville. *See* **Lubumbashi.**
Elizabeth, t., **S. Australia;** planned t. built in 1954; residtl.; chemical wks.; p. (1966) 32,948.
Elizabeth, c., N.J., **USA;** univ.; sewing machines, iron, oil refining, automobiles, aircraft components; now inc. in Newark; p. (1960) 107,698.
Elk I., Nat. Park, **Canada;** animal reserve, tourism.
El Khârga, oasis, Libyan desert, **Egypt,** 85 m. S.W. of Asyût; site of New Valley Project for irrigation.
Elkhart, t., Ind., **USA;** E. of Chicago; paper, machin.; elec. equipment, musical instruments; p. (1960) 40,274.
Elk Mtns., W. Col., **USA;** highest point Castle Peak, 14,115 ft.
Elland, t., West Yorks., **Eng.;** on R. Calder, 3 m. S.E. of Halifax; textiles; p. (1971) 17,817.
Ellesmere, agr. dist., S.I., **N.Z.;** on Canterbury Plain nr. Christchurch.
Ellesmere, mkt. t., N. Shropshire, **Eng.;** nearby lake; tourism; p. (1961) 2,254.
Ellesmere I., extreme N. of Arctic **Canada;** barren, uninhabited; a. 41,000 sq. m.
Ellesmere Port, t., N.W. Cheshire, **Eng.;** on Manchester Ship Canal and 9 m. S.S.E. of Liverpool; metal mftg., paper, engin., oil refineries; cars; expanded t.; p. (1971) 61,556.
Elliot Lake, t., N. Ont., **Canada;** ctr. of uranium mines.
Ellice Is. *See* **Gilbert and Ellice Is.**
Ellis I., N.Y. harbour, **USA;** served as ch. immigration ctr., 1892–1943.
Ellon, burgh, Aberdeen, **Scot.;** on R. Ythan; p. (1971) 3,505.
Elmira, t., N.Y., **USA;** rly. gds., farm implements; burial place of Mark Twain; p. (1960) 46,517.
El Misti, mtn., S. **Peru;** dormant volcano with snow cap; alt. 19,166 ft.
Elmshorn, t., **W. Germany;** N.W. of Hamburg; shipbldg.; p. (1963) 35,400.

El Paso, c., Texas, **USA**; on E. bank Rio Grande opposite Ciudad Juárez (Mexico); natural gas distribution, oil refining, metallurgy; tourism; p. (1968) 276,687 (c.), 351,400 (met. a.).

El Salvador. *See* Salvador.

El Segundo, t., Cal., **USA**; lge oil refinery; assembly of aircraft components.

El Sharana, t., N.T., Australia; mng. base for uranium; uranium processing.

Elsinore (Helsingör), t., spt., **Denmark**; shipbldg.; setting of Shakespeare's *Hamlet*; p. (1965) 29,327.

Elstow, v., Beds., **Eng.**; birthplace of Bunyan.

Elstree, t., Herts., **Eng.**; 4 m. W. of Barnet; residtl.; films, lt. engin., silk hosiery; p. (1971) 33,516 (dist.).

El Teniente, Andean t., central Chile; copper mng. and smelting; p. 11,761.

Eltham, residtl. sub. in London Bor. of Greenwich, **Eng.**

Eluru, t., Andra Pradesh, **India**; cotton, carpets, hosiery, oil; p. (est. 1970) 132,791.

Elvas, mkt. t., **Portugal**; on Guadiana R.; plums, olives, jams; cath.; once strongly fortfd.; p. (1960) 11,742.

Ely, t., Cambridge, **Eng.**; on S. fringe of Fens; mkt., cath.; agr. ctr.; p. (1971) 9,969.

Ely, I. of. *See* Cambridgeshire.

Elyria, t., Ohio, **USA**; mftg.; p. (1960) 43,782.

Emba, R., Kazakh SSR, **USSR**; rises in Urals, flows S.W. to Caspian Sea; crosses productive Ural–Emba oilfield; 380 m. long.

Emden, t., Lower Saxony, **W. Germany**; impt. N. Sea pt. nr. mouth of R. Ems and on Dortmund–Ems and Ems–Jade canals; exp. coal and iron from Ruhr; shipyards, fisheries; p. (est. 1967) 47,300.

Emene, t., **Nigeria**; nr. Enugu; steel plant; cement.

Emilia-Romagna, region, **N. Italy**; S. of Po R.; divided into 8 provs.; fertile agr. a.; a. 8,542 sq. m.; p. (1969) 3,834,468.

Emmen, t., Drenthe, **Neth.**; 30 m. S.E. of Groningen; elec. machin., ball bearings, tinplate, iron wks.; p. (1968) 76,599.

Emmental, dist., **Switzerland**; dairy produce, especially cheese.

Empoli, t., Tuscany, **Italy**; on R. Arno; textile mnfs., glass; p. (1961) 34,989.

Emscher, R., **W. Germany**; rises in Sauerland, flows W. through heart of Ruhr coalfield to enter R. Rhine at Hamborn; canalised for most of its course; highly polluted; 55 m. long.

Encarnación, pt., cap. of Ipatua dep., S.E. Paraguay; on Paraná R.; exp. timber, maté, tobacco, cotton, hides; p. (1962) 35,186.

Enderby Land, Australian terr., S. of C. of Good Hope, Antarctica.

Enfield, former M.B., Middlesex, **Eng.**; now outer bor. Greater London; comprising Edmonton, Enfield, and Southgate; p. (1971) 266,788.

Enfield, t., Conn., **USA**; mftg.; p. (1960) 31,464.

Engadine, Switzerland; upper valley of Inn R.; health resort; ch. t. St. Moritz; Swiss Nat. Park.

Enggano, I., Sumatra, **Indonesia**; sparse primitive p.; hunting, fishing, shifting cultivation.

Engelberg, t., Unterwalden, **Switzerland**; tourism.

Engels, c., **RSFSR**; on Volga; R. pt., mftg. and food-processing ctr.; engin., petroleum refining, textiles; p. (1970) 130,000 (c.), 151,000 (met. a.).

England, southern and lgst political div. of U.K.; bounded by Wales on W., by Scot. on N. and separated from continent of Europe by English Channel and North Sea; highly industl., circa 80 per cent of p. live in urban areas; major trading nation through main pts. London, Liverpool, Southampton; increasing contrast between prosperous S. and depressed N. and W.; very varied geology and topography produce contrasts in landscape, matched by climatic variability; increasingly attractive as tourist area although urban and agr. pressures on rural countryside cause concern in such a densely populated cty.; excellent road and rail network improved by construction of motorways and rly. electrification between London and Glasgow (Scot.); rich and varied cultural heritage and historic bldgs.; developing welfare st.; cap. London; a. 50,331 sq. m.; p. (1971) 45,870,062.

Englewood, t., Col., **USA**; sub. of Denver; glasshouses; p. (1960) 33,398.

Englewood, t., N.J., **USA**; elevators, leather gds.; p. (1960) 26,057.

English Channel (La Manche), narrow sea separating England from France; extends from Strait of Dover to Land's End in Cornwall; length 300 m., greatest width 155 m.

Enham-Alamein, Hants., **Eng.**; rehabilitation ctr. for disabled ex-service men; 2·5 m. N. of Andover; lt. inds.

Enid, t., Okla., **USA**; univ.; ironwks., farm implements; wheat mkt.; p. (1960) 38,859.

Enkhuizen, t., R. pt., **Neth.**; on IJsselmeer; p. (1967) 11,231.

Enna (Castrogiovanni), t., Sicily, **Italy**; sulphur-mines; famous for its connection with the Proserpine legend; p. (1969) 28,767.

Ennepetal, t., N. Rhine–Westphalia, **W. Germany**; t. created 1949 with merging of Milspe and Voerde; iron, machin.; p. (1963) 32,000.

Ennerdale Water, L., Cumbria, **Eng.**

Ennis, mkt. t., **U.D.**, Clare, **R.o.I.**; p. (1966) 5,831.

Enniscorthy, mkt. t., U.D., Wexford, **R.o.I.**; cath.; p. (1966) 5,762.

Enniskillen, co. t., Fermanagh, **N. Ireland**; brewing, nylon mftg., meat processing; p. (1966) 7,154.

Enns, R., Austria; S. trib. of Danube; 112 m.

Enschede, c., Overijssel, **Neth.**; textile ctr.; technical univ.; p. (est. 1969) 138,064 (c.), 228,228 (met. a.).

Ensenada, t., **Mexico**; spt., exp. cotton; fishing and fish processing; p. (1970) 113,320.

Entebbe, t., **Uganda**; on L. Victoria; univ.; cotton ginning; airport; p. (est.) 11,000.

Entre Rios, prov., **Argentina**; between Paraná and Uruguay Rs.; wheat, linseed, livestock; cap. Paraná; a. 29,427 sq. m.; p. (1960) 804,000.

Enugu, cap. of E. prov., **Nigeria**; coal; cloth mill; p. (est. 1970) 164,582.

Epernay, t., on S. bank of Marne, **France**; champagne ctr.; p. (1968) 27,767.

Ephesus, anc. Ionian c., in what is now **Turkey**, S. of Izmir; sacked by Goths A.D. 262; excavations.

Epinal, t., cap. of Vosges dep., **France**; on Moselle R.; textiles, printing, liqueur; p. (1968) 39,991.

Epirus, dist., N.W. **Greece**; a. 3,688 sq. m.; p. (1961) 352,604.

Epping Forest, Essex, **Eng.**; forest a. N.E. of London free to public (opened by Queen Victoria 1882); formerly part of royal hunting forest.

Epsom and Ewell, ts., former M.B., Surrey, **Eng.**; 18 m. S.W. of London; residtl., racecourse; p. (1971) 72,054.

Epworth, v., Humberside, **Eng.**; birthplace of John Wesley.

Equatorial Guinea, rep., W. **Africa**; former Spanish col.; comprises 2 provs.: Río Muni (mainland and Is. of Corisco, Elobey Grande, Elobey Chico) and Fernando Po (Is. of Fernando Po and Annobon); narrow coastal plain and dissected upland plateau (2,000 ft.); economy almost entirely based on agr. and timber; exploration for oil; cap. Santa Isobel on Fernando Po I.; a. 17,526 sq. m.; p. (est. 1968) 250,000.

Erbil, t., **Iraq**; comm. ctr.; rly. terminus; p. (1965) 134,000 (met. a.).

Erebus, mtn., active volcano, Victoria Land, Antarctica; alt. 13,202 ft.

Erfurt, admin. dist., **E. Germany**; a. 2,827 sq. m.; p. (1968) 1,256,034.

Erfurt, c., **E. Germany**; on Gera R.; cath., ctr. of mkt. gardening and seed-growing dist., textiles, machin., foodstuffs, footwear, radios, heavy engin.; p. (est. 1969) 193,997.

Ericht, loch, Perth, Inverness, **Scot.**; in central Grampians; 15·5 m. long; hydroelec. scheme.

Erie, c., N.W. Penns., **USA**; pt. on L. Erie; coal, iron, grain, petroleum; machin., domestic appliances; p. (1970) 125,941 (c.), 257,860 (met. a.).

Erie Canal. *See* New York State Barge Canal.

Erie, one of Great Lakes (the shallowest), N. America, separating Canada from USA; 241 m. long, 30–57 m. wide; polluted waters; petroleum resources.

Erith, former M.B., Kent, **Eng.**; on Thames estuary; plastics, paints, varnishes, timber, concrete; now inc. in London bor. of Bexley.

Eritrea, prov., Ethiopia; tobacco, cereals, pearl fishing; cap. Asmara, a. 45,754 sq. m.; p. (1961) 1,100,000.

Erivan. *See* Yerevan.

Erlangen, t., Bavaria, **W. Germany**; univ.; textiles, elec. and precision engin., gloves; p. (1963) 73,200.

Ermelo, t., **Neth.**; ctr. of agr. dist.; p. (1968) 35,434.

Ernakulam, t., Kerala, **India**; cotton, coffee, hides; p. (est. 1970) 213,811 (c.), 493,460 (met. a.).

Erne R., N. Ireland/ R.o.I.; links Ls. in Cavan and Fermanagh; 72 m. long.

Erode, t., S. Tamil Nadu, **India**; on R. Cauvery; p. (1961) 73,762.

Erzgebirge (Ore Mtns.), mtn. range along border of **ČSSR** and **Germany**, reaching highest peak in Mt. Klinovec (4,064 ft.) in ČSSR; uranium; tourism.

Erzurum, t., **Turkey**; agr. ctr. on fertile plateau 6,200 ft. a.s.l.; formerly of gr. strategic importance; univ.; p. (1965) 105,317 (t.), 174,155 (met. a.).

Esbjerg, spt., **Denmark**; W. cst. of Jutland; export harbour on N. Sea cst.; exp. agr. prod.; fishing; airport; p. (1965) 55,882.

Esch-sur-Alzette, t., **Luxembourg**; mng. ctr.; steel; p. (1968) 27,466.

Eschwege, t., Hesse, **W. Germany**; cas.; machin., textiles, leather, cigars, chemicals; p. (1963) 24,000.

Eschweiler, t., N. Rhine–Westphalia, **W. Germany**; N.W. of Aachen; lignite mng., steel, iron, metallurgy, leather, textiles; p. (1963) 40,000.

Esdraelon, plain, **Israel**; between Carmel and Gilboa Mtns.

Eṣfahān (Isfahan, anc. Aspadana), c., central **Iran**; prov. cap.; historic, picturesque c. noted for carpets and metal ware; tourism, airpt.; new steel mill; p. (1966) 424,043.

Esher, t., Surrey, **Eng.**; on R. Mole, residtl.; Sandown Park racecourse; p. (1971) 64,186.

Eshowe, health resort, Natal, **S. Africa**; 40 m. from Tugela R.; p. (1960) 4,919.

Esk R., Dumfries, **Scot.**, Cumberland, **Eng.**; attractive agr. valley; flows into Solway F. from confluence of Black and White Esk Rs.; 23 m. long.

Eskilstuna, t., **Sweden**; on R. of same name; iron, steel, machin., machin. tools; p. (1968) 173,900.

Eskisehir, t., **Turkey**; W. of Ankara, anc. Dorylaeum; rly. ctr.; meerschaum; p. (1965) 173,882 (t.), 243,033 (met. a.).

Esmeraldas, prov., **Ecuador**; cap. E. on R. of same name; cacao, tobacco; a. 5,464 sq. m.; p. (est. 1962) 124,742.

Esmeraldas, pt., **Ecuador**; bananas, timber, tobacco, cacao, rubber; gold mines nearby; p. (1962) 13,169.

Esneh. *See* Isna.

Espirito Santo, st. **Brazil**; sugar, cotton, coffee, fruits, lumber, thorium; cap. Vitória; a. 15,785 sq. m.; p. (est. 1968) 1,921,353.

Espiritu Santo, I., New Hebrides; volcanic I., lgst. of gr.; depopulation.

Essaouira (Mogador), spt., **Morocco**; cereals, almonds, gum-arabic, crude oil; p. (1960) 26,392.

Essen, c., N. Rhine–Westphalia, **W. Germany**; gr. industl. c., ctr. of Ruhr conurbation; coal, steel (Krupp), electric power, engin.; canal links with Dortmund–Ems and Mittelland canals and with Rhine; minster severely damaged in second world war; p. (est. 1969) 705,700 (c.); (est. 1967) 5,150,000 (met. a.).

Essequibo R.; flows N. from Brazilian border draining half **Guyana**; lower course navigable, rapids; timber in upper valley; 600 m. long.

Essex, non-met. co., **Eng.**; bounded on S. by Thames, on E. by N. Sea; co. t. Chelmsford; on London clay and chalk; agr.; wheat, barley, sugar-beet; mkt. gardens; S.W. of co. forms part of Greater London with mftg. subs.; oil refineries at Shell Haven; civil nuclear power sta. at Bradwell; univ. at Colchester; a. 1,018 sq. m.; p. (1971) 1,354,000.

Esslingen, t., Baden–Württemberg, **W. Germany**; on R. Neckar; mach. and rly. shops; textiles, chemicals, leather gds.; Liebfrauen church (1440); p. (1963) 83,900.

Essonne, dep., **France**; S. of Paris; cap. Ivry; a. 699 sq. m.; p. (1968) 674,157.

Esteli, cap. Esteli, **Nicaragua**; on Inter-American Highway; p. (1963) 26,764.

Eston, t., Cleveland, **Eng.**; 3 m. E. of Middlesbrough; shipbldg. and repairing; p. (1961) 37,160.

Estonia, constituent rep., **USSR**; borders on Baltic, G. of Finland, G. of Riga; lowland with many Ls.; farming and dairying, fishing; oil deposits; hydroelec. power; mainly Lutheran; univ.; cap. Tallin; a. 17,610 sq. m.; p. (1970) 1,357,000.

Estoril, wat. pl. and thermal spa, **Portugal**; N. side of Tagus estuary; holiday resort.

Estremadura, maritime prov., **Portugal**; agr., tourism; cap. Lisbon; a. 2,065 sq. m.; p. 1,600,000.

Estremadura, region, S.W. **Spain**; on the border of Portugal; largely plateau, alt. 1,500–3,000 ft.; heathy moorland; sheep; less arid conditions than in remainder of central Spain allow olives, vines, cereals; irrigation in valleys of Tagus, Guadiana; govt. project to develop a. in progress.

Esztergom, t., **Hungary**; R. pt. on Danube; iron foundries, machine tools; mineral springs; cath.; p. (est. 1966) 26,000.

Etang de Berre, lagoon, Bouches-du-Rhône, S.E. **France**; E. of Rhône delta; traversed by Rhône–Marseille canal; salt pans; oil refineries in a.; approx. a. 100 sq. m.

Etaples, t., Pas-de-Calais, **France**; seaside resort; p. (1962) 8,647.

Etawah, t., Uttar Pradesh, **India**; textiles; p. (1961) 69,681.

Ethiopia (Abyssinia), indep. Empire, N.E. **Africa**; temperate climate as a result of high plateau terrain; coffee most impt. comm. crop, but poor communications inhibit economic development; low per capita income and rapid growth of p.; ch. pt. Assab; English widely spoken; univs. at Addis Ababa and Asmara; cap. Addis Ababa; a. 471,776 sq. m.; p. (est. 1967) 23,667,400.

Ethiopian Highlands, mtns., **Ethiopia**; rise over 15,000 ft.; source of headwaters of tribs. of R. Nile.

Etna, volcano, N.E. Sicily, **Italy**; most recent eruption 1971; alt. 10,741 ft.

Eton, t., Berks., **Eng.**; on N. bank of R. Thames opposite Windsor; public school, founded by Henry VI; p. (1971) 3,954.

Etruria, anc. dist., **Italy**; now forms Tuscany; home of the Etruscans and part of the Roman empire by 400 B.C.

Etruria, t., Staffs., **Eng.**; part of Stoke-on-Trent; seat of Josiah Wedgwood's potteries (1769).

Euboea, lgst of Greek Is., Ægean Sea; mtnous. (Mt. Delphi 5,725 ft.); vines and olives in lowlands, sheep and goats in highlands; a. 1,492 sq. m.; p. (1961) 165,758.

Euclid, t., Ohio, **USA**; electrical and agr. machin.; p. (1960) 62,998.

Eucumbene Dam and **L.**, N.S.W., **Australia**; major storage of Snowy Mtns. hydroelectric scheme; holds eight times as much water as Sydney harbour.

Eugene, c., Ore., **USA**; univ.; mkt. ctr. for rich agr. and lumbering region; fruit-canning, sawmilling; headquarters of Williamette National Forest; p. (1970) 77,284 (c.), 212,644 (met. a.).

Euphrates, lgst. R. in S.W. Asia; rises in Armenian uplands and joined by the Tigris enters Persian G. as the Shatt-al Arab; anc. ctr. of civilisation; modern irrigation, navigation; 1,780 m. long.

Eure, dep., Normandy, **France**; agr., fruit, livestock, textiles; cap. Evreux; a. 2,331 sq. m.; p. (1968) 383,385.

Eure-et-Loir, dep., N. **France**; mainly agr.; cap. Chartres; a. 2,291 sq. m.; p. (1968) 302,207.

Europe, continent; W. peninsula of Eurasian land mass; no well-defined bdy. with Asia but line normally accepted runs along Ural Mtns. to Caspian Sea and Caucasus to Black Sea, Sea of Marmara and Dardanelles; after Australia, Europe is smallest continent in a.,

but contains 20 per cent of world's p. and even more of world's economic activity; climate varies from Arctic to Mediterranean and from temperate maritime to severe continental; major physical features inc. Alps, Pyrenees in S., Baltic Shield in N.; major political div. between E. and W. Europe along Iron Curtain; W. Europe also divided into economic grs. EEC and EFTA; major concentration of p. and economic activity within Golden Triangle (q.v.); total a. circa 4,000,000 sq. m.; p. (est. 1969) 642,500,000.

Europort, name of the latest expansion of the Rotterdam docks, Neth.; capable of handling 100,000-ton oil-tankers; oil refining; European oil supply etc.; joined to Rotterdam by the New Waterway.

Evanston, t., **USA**; on L. Michigan; sub. of Chicago; univ.; p. (1960) 79,283.

Evansville, c., Ind., **USA**; on Ohio R.; shipping and comm. ctr. for agr. region; coal mng.; p. (1970) 137,997 (c.), 230,708 (met. a.).

Eveneki National Area, Siberia, **RSFSR**; forest and tundra covered; home of Eveneki people; cap. Tura; a. 286,000 sq. m.; p. (1970) 13,000.

Everest, Mt. (Chomolungma = Goddess Mother of the Earth), Himalaya, on frontier of Nepal and Tibet; alt. 29,028 ft.; highest mtn. in the world; Hillary and Tenzing first to reach summit in 1953.

Everett, mftg. t., Mass., **USA**; nr. Boston; iron and steel; p. (1960) 43,544.

Everett, t., Wash., **USA**; on Puget Sound; harbour; comm. ctr.; timber; tourism; p. (1960) 40,304.

Everglades, Fla., **USA**; subtropical a., extensive marshes; home of Seminole Indians; lge. scale drainage since 1905; early vegetables.

Evesham, mkt. t., Hereford and Worcs., **Eng.**; on R. Avon, in Vale of Evesham, 15 m. S.E. of Worcester; fruit ctr.; tourism; p. (1971) 13,847.

Evora, t., cap. of Upper Alentejo prov, S. **Portugal**; mkt. for agr. prod.; cath.; p. (1960) 24,144.

Evreux, t., cap. of Eure dep., **France**; mkt. ctr.; p. (1968) 45,441.

Evros, prov., **Greece**; borders Bulgaria and Turkey; a. 1,618 sq. m.; p. (1961) 157,901.

Exe, R., Somerset and Devon, **Eng.**; rises on Exmoor, flows S. via Exeter to English Channel at Exmouth; 54 m. long.

Exeter, cath. c., co. t., Devon, **Eng.**; former Roman Isca; E. of Dartmoor on R. Exe; mkt. t.; univ.; aircraft components; airport; p. (1971) 95,598.

Exmoor, Somerset and Devon, **Eng.**; sandstone, moorland, deep wooded valleys; Nat. Park.

Exmouth, t., Devon, **Eng.**; on estuary of R. Exe; holiday resort; p. (1971) 25,815.

Exploits, R., Newfoundland, **Canada**; l. 150 m.; used for hydroelectric power.

Eye, mkt. t., Suffolk, **Eng.**; 18 m. N. of Ipswich; anc. church; p. (1971) 1,659.

Eyemouth, burgh, Berwick, **Scot.**; on E. cst. 9 m. N. of Berwick; fishing; p. (1971) 2,530.

Eyre Lake, shallow salt L., S. **Australia**; 38 ft. below sea-level and practically dry; a. 3,500 sq. m.

Eyre Peninsula, S. **Australia**; between Gr. Australian Bight and Spencer G.; iron-ore deposits; a. 20,000 sq. m.

F

Fabriano, t., Marches, **Italy**; in Apennines; cath.; paper mills; p. circa 29,000.

Faenza, t., Ravenna, **Italy**; at foot of Apennines; majolica, textiles; p. (1961) 51,085.

Fagersta, t., Västmanland, **Sweden**; iron, steel smelting; p. (1961) 15,527.

Failsworth, t., Gtr. Manchester, **Eng.**; N.E. of Manchester; textiles, elec. gds.; p. (1971) 23,233.

Fairbanks, t., Alaska, **USA**; univ.; sawmilling; mng.; p. (1960) 13,311.

Fairfield, t., Conn., **USA**; chemicals, automobile parts; univ.; p. (1960) 46,183.

Fair I., midway between Shetland and Orkney, **Scot.**; bird sanctuary; famous for brightly patterned, hand-knitted articles.

Fairmont, t., W. Va., **USA**; glass, machin., coal by-products; p. (1960) 27,477.

Faiyum or Fayum, t. and region, N. **Egypt**; oasis nr. L. Karun (anc. L. Moeris), fertilised by Nile water and silt; cereals, sugar-cane, fruits, cotton; archeological finds; p. of t. (est. 1970) 150,900.

Faizabad, t., **India**; rly. junc.; sugar refining; p. (1961) 88,296.

Falaise, t., Calvados, **France**; birthplace of William the Conqueror; p. (1968) 7,599.

Falaise de l'Ile de France, low S.E.-facing escarpment, 50 m. S.E. and E. of Paris, **France**; overlooks Champagne Pouilleuse; ch. vine-growing dist. for champagne-wine ind. of Reims, Epernay.

Falcón, st. Venezuela; bordering Caribbean Sea; cap. Coro; p. (1961) 340,450.

Falconara, t., **Italy**; nr. Acona; spt.; oil refining, shipbldg.

Falkirk, burgh, Stirling, **Scot.**; 10 m. S.E. of Stirling; foundries, bricks, chemical, aluminium wks. concrete, timber yards; battles 1298 and 1746; p. (1971) 37,579.

Falkland, burgh, Fife, Scot.; 3 m. S. of Auchtermuchty; mkt.; p. (1971) 896.

Falkland Is., Brit. Crown col., S. Atl., comprises E. and W. Falkland and adjacent Is.; sheep rearing (for wool); cap. Port Stanley on E. Falkland I.; claimed by Argentina; a. 6,270 sq. m.; p. (1969) 2,098.

Falkland Is. Dependencies, S. Atl.; inc. Is. of S. Georgia and S. Sandwich; a. 1,730 sq. m.; p. (of S. Georgia) 11 males; now form part of Brit. Antarctic Terr.

Fall River, c., Mass., **USA**; on Mt. Hope Bay; pt. of entry; clothing, rubber gds., food prods., paper; p. (1970) 95,679 (c.), 148,430 (met. a.).

Freshwater, sm. t., I. of Wight, **Eng.**; at W. end of I., 8 m. W. of Newport; resort.

Fresnillo, t., Zacatecas, **Mexico**; alt. 7,300 ft.; mkt. t., silver mng.; p. (1970) 101,316.

Fresno, c., Cal., **USA**; ctr. of vast irrigated fruit-

growing dist.; p. (1970) 162,326 (c.), 407,048 (met. a.).
Fribourg, (Freiburg), c., cap. of F. can. Switzerland; between Berne and Lausanne; viaduct and bridges; cath., univ.; p. (1969) 40,500.
Fribourg (Freiburg), can., Switzerland; mainly dairy farming; cereals, sugarbeet, cheese; a. 645 sq. m.; p. (1969) 174,000.
Friedrichshafen, t., W. Germany; on Bodensee; machin., boat bldg., motors; resort; p. (est. 1967) 40,300.
Friendly Is. *See* Tonga.
Friern Barnet. *See* Barnet.
Friesland, prov., N. Neth.; cap. Leeuwarden; dairying, horses, cattle; natural gas on Ameland I.; a. 1,325 sq. m.; p. (1968) 511,330.
Frimley and Camberley, ts., former U.D., Surrey, Eng.; 3 m. N. of Farnborough; lt. engin., plastics; military training ctr.; p. (1971) 44,784.
Frinton and Walton, Essex, Eng.; on E. cst., 5 m. N.E. of Clacton; seaside resort; p. (1971) 20,431.
Frisches Haff, shallow freshwater lagoon, Baltic cst. of Poland; 53 m. long, 4–11 m. broad.
Frisian Is., chain of Is. stretching from Den Helder to Jutland, along csts. of Neth., Germany, and Denmark; ch. Is. are Texel, Vlieland, Terschelling, Ameland (West F. Is), Nordeney, Borkum (East F. Is.), Sylt, Föhr, Romo (North F. Is.).
Friuli-Venezia Giulia, aut. reg. (created 1963), N.E. Italy; comprising 3 provs. Udine, Gorizia, and Trieste; cap. Trieste; p. (1969) 1,228,927.
Frobisher Bay, inlet in S. Baffin I., N. Canada, extending 200 m. between Cumberland Sound and Hudson Strait.
Frodingham, t., Humberside, Eng.; on W. flank of limestone ridge, Lincoln Edge; impt. iron-ore open-cast mines; mnfs. iron and steel; p. with Scunthorpe (1971) 70,800.
Frome, mkt. t., Somerset, Eng.; on R. Frome, 11 m. S. of Bath; p. (1971) 13,384.
Frome, R., Dorset, Eng.; flows from N. Dorset Downs into Poole Harbour.
Frontignan, t., Hérault, S. France; oil refining; pipeline under sea from Sète; produces muscat; p. (1962) 8,309.
Frunze, c., cap. of Kirghiz SSR, USSR; univ.; engin., textiles, meat-packing; p. (1970) 431,000.
Fuerteventura, I., Canary gr.; a. 663 sq. m.; p. (1962) 18,333.
Fujayrah, emirate, one of United Arab Emirates, Persian G.; p. (est. 1968) 10,000.
Fujisawa, t., Honshu, Japan; bearings machin.; p. (est. 1969) 219,000.
Fujiyama, extinct volcano, Japan; 60 m. S.W. of Tokyo; pilgrim resort; hgst. peak of Japan; alt. 12,395 ft.
Fukien (Fujian), prov., China; cap. Foochow (Fuzhou); intensive agr., rice and sugar-cane; shellfish raised along cst.; a. 47,530 sq. m.; p. (1957) 14,650,000.
Fukui, c., cap. of F. pref., central Honshu, Japan; synthetic fibres, paper; old silk-weaving ctr.; p. (est. 1969) 196,000.
Fukuoka, c., N. Kyushu, Japan; pt. on Hakata Bay; univ. ctr., old cas. t.; textiles, dolls, shipbldg.; p. (est. 1969) 825,000.
Fukushima, c., N. Honshu, Japan; ceramics, foods, steel; publishing; p. (est. 1969) 223,000.
Fukuyama, c., S. Hokkaido, Japan; p. (est. 1969) 242,000.
Fulda, t., Hesse, W. Germany; nr. Kassel; on R. Fulda; palace, abbey; textiles, metallurgy, rubber; route ctr.; p. (est. 1967) 44,400.
Fulham. *See* Hammersmith.
Fulwood, t., Lancs., Eng.; 2 m. N.E. of Preston; p. (1971) 21,741.
Funchal, cap. of Madeira Is., pt., winter resort; cath.; p. (1960) 43,301
Fundy, Bay of, inlet between Nova Scotia and New Brunswick, Canada; lge. tidal range of 70 ft.
Furka Pass, Switzerland; between Valais and Uri cans.; 7,976 ft.
Furneaux Is., S.E. Australia; in Bass Strait, belonging to Tasmania; lgst is Flinders I.; p. (1966) 1,220.
Furness, dist., Cumbria, Eng.; between Morecambe Bay and the Irish Sea.
Fürstenwalde, t., Frankfurt, E. Germany; on R. Spree; metallurgy, leather, tyres; p. (1965) 30,489.
Fürth, t., Bavaria, W. Germany; nr. Nürnberg; toy and glass inds.; p. (est. 1967) 94,800.
Fusan. *See* Pusan.
Fuse, t., Honshu, Japan; machin., textiles, chemicals; now part of Higashiosaka; p. (1966) 253,000.
Fushimi, c., Honshu, Japan; sub. of Kyoto; p. (1965) 128,281.
Fushun, c., Liaoning, N. China; at foot of Changpai Shan, 22 m. S.E. of Mukden; major industl. ctr.; possesses world's thickest bituminous coal seam (417 ft.) worked by deep and opencast mines; oil refinery based on local oil shales; steelwks., chemicals; p. (1957) 985,000.
Fusin (Fuxin), c., Liaoning, N. China; ctr. of lge coalfield; p. (1953) 188,600.
Fuskiki, spt., Honshu, Japan; serves Toyama c. with metals, coal.
Futa, La, pass, Tusco-Emilian Apennines, N. Italy; used by main road from Bologna to Florence; alt. 2,962 ft.
Futa Jalon, upland dist., mostly in Guinea, W. Africa, with outliers in Liberia and Sierra Leone.
Futseling, t., Anhwei, China; site of lge dam on Hwai Ho, built 1954.
Fylde, W. Lancs., Eng.; low plain behind coastal sand dunes; pig- and poultry-rearing dist.; ch. t. Blackpool; p. (1971) 20,251 (dist.).
Fylingdales, ballistic missile early warning sta. on N. Yorks. moors, Eng.
Fyn, I., Denmark; in Baltic Sea; a. 1,320 sq. m.; cap. Odense; dairying, sugarbeet; p. (1965) 389,404.
Fyne, loch on Argyll cst. W. Scot.; an arm of F. of Clyde; 40 m. long.
Fyzabad, t., Uttar Pradesh, India; mkt. t.; sugar refineries; p. (1961) 88,296.

G

Gabès, spt., Tunisia; on G. of Gabès, 200 m. S. of Tunis; dates, henna, wool; p. (1966) 76,356.
Gabon, rep., W. Africa; Cameroon to N., Zaïre to S. and E.; tropical climate, hot, humid; much tropical rain forest; forestry main ind. but mng. increasingly impt.; exp. petroleum, manganese at Moanda (S.), iron-ore at Mekambo (N.E.); communications geared mainly to mng. areas; major pts. Libreville (cap.), Port Gentil; intense forest cover makes internal air services very impt.; airport at Libreville; a. 103,000 sq. m.; p. (est. 1970) 475,000.
Gaborone, cap. Botswana; formerly sm. v.; chosen as cap. for new rep., bldg. began 1964; p. (est. 1970) 15,000.
Gadag-Betgeri, t., Karnataka, India; cotton and silk weaving; p. (1961) 76,614.
Gaeta, t., naval pt., Italy; on promontory on shore of G. of Gaeta; the anc. Caietae Portus; cath.; p. (1961) 20,569.
Gafsa, t., Tunisia; phosphate mng. ctr.; p. (1961) 24,300.
Gaillard Cut, excavated channel, Panama Canal Zone; carries Panama Canal through Culebra Mtn. from L. Gatun to Pac. Oc.; 7 m. long.
Gainesville, t., Fla., USA; univ.; mkt. gardening; electronics, wood prod.; p. (est. 1969) 67,000.
Gainsborough, t., Lincs., Eng.; on R. Trent; agr. implements, milling, packing and wrapping machin.; some R. traffic; mkt.; George Eliot's St. Ogg's in *Mill on the Floss*; p. (1971) 17,420.
Gairdner, salt L., S. Australia; a. 1,840 sq. m.
Gairloch, sea loch and v., W. Ross and Cromarty, Scot.; resort, fishing; p. (1971) 1,783.
Galápagos, volcanic Is., Pac. Oc.; 600 m. W. of Ecuador (to whom they belong) on equator; flora and fauna peculiar to each I.; visited by Darwin 1835; now a wildlife sanctuary; a. 2,868 sq. m.; p. (1967) 3,100.
Galashiels, burgh, Selkirk, Scot.; on Gala Water, 2 m. above confluence with R. Tweed; tweeds, woollens; p. (1971) 12,609.
Galati or Galatz, c., E. Romania; major inland pt. on lower Danube; cath.; p. (est. 1969) 172,687.
Galesburg, t., Ill., USA; engin., coal mng.; p. (1960) 37,243.

Galicia, historic region, S.E. Poland and W. Ukraine, USSR.

Galicia, region, N.W. Spain; comprising provs. La Coruña, Lugo, Orense, and Pontevedra.

Galilee, northern div. of Palestine in Roman times, containing the ts. Cana, Capernaum, Tiberias, Nazareth; the ch. scene of Christ's ministry.

Galilee, Sea of (Lake Tiberias), also known as L. Gennesaret; Biblical associations; 680 ft. below level of Med.; Israel plans to draw water from L. to irrigate Negev; a. 64 sq. m.

Gallarate, t., Italy; nr. Milan; textiles; p. (1961) 35,477.

Galle, c., pt. on S.W. cst. of Sri Lanka; exp. tea, rubber, coconut oil; suffered from competition with Colombo after construction of modern harbour there; p. (1963) 64,942.

Gallego, R., N.E. Spain; rises in Pyrenees, flows S. to R. Ebro at Zaragoza; provides irrigation around Zaragoza; valley used by main rly. across Pyrenees from Pau (France) to Zaragoza; 110 m. long.

Gallipoli. *See* **Gelibolu.**

Gällivare, dist., N. Sweden, in Norrbotton prov.; rich iron-ore deposits; p. (1968) 26,625.

Galloway, anc. dist., S.W. Scot.; inc. cos. Kirkcudbright and Wigtown; dairying.

Galloway, Mull of, the extremity of the Rinns of G., the most southern pt. of Scot.

Galston, burgh, Ayr, Scot.; on R. Irvine, nr. Kilmarnock; p. (1971) 4,239.

Galt., t., Ont., Canada; textiles, shoes; p. (1971) 38,134.

Galveston, c., spt., Texas, USA; on I. in Bay at entrance to G. of Mexico; gr. cotton and sulphur pt. with lge. exp. of agr. prod.; mills, foundries, food-processing, chemicals; univ., resort; p. (1970) 60,714 (c.), 165,669 (met. a.).

Galway, co., Galway Bay, Connacht, R.o.I.; fishery, cattle, marble quarrying; a. 2,452 sq. m.; p. (1966) 148,190.

Galway, co. t., Galway, R.o.I.; univ.; spt., fishing; sawmills, textiles, printing; p. (1966) 24,495.

Gambia, The, rep. (1970), W. Africa, on Atl. Oc.; comprises St. Mary's I. (on which is Banjul, the cap.) and narrow mainland enclave (average width 20 m.) extending 200 m. inland astride R. Gambia; hot all year, summer rain, but savannah inland; agr. is basis of economy, especially rice; economic aid from Taiwan; communications developed around Banjul (spt. and airpt.); a. 4,003 sq. m.; p. (est. 1968) 360,000.

Gambia, R., Senegal and Gambia, rises in Futa Jallon Plateau, flows N. and W. into Atl. Oc. at Banjul; forms main means of communication through Gambia, 700 m. long.

Gambier Is., Fr. Polynesia, S. Pac. Oc.; 4 coral Is.; a. 12 sq. m.

Gandhinagar, new cap. of Gujarat, India; on Sabarmati R., 13 m. N. of Ahmedabad; under construction; planned initial p. 75,000 rising to 200,000.

Ganges (Ganga), sacred R. of India; rises in Himalayas and flows to Bay of Bengal via alluvial cones at foot of Himalayas and by several delta mouths, on one of which stands Calcutta; navigable for lge. ships from Allahabad; delta alone larger than Eng. and Wales; flood plain and delta very fertile and densely populated; 1,500 m. long.

Gangtok, t., cap. of Sikkim, E. Himalayas; agr. tr. ctr.; carpets; p. (1965) 12,000.

Gap, t., Hautes Alpes, S.E. France; textiles; p. (1962) 21,935.

Gard, dep., S. France; in Languedoc, on Mediterranean; cap. Nîmes; vines, olives, sericulture; a. 2,270 sq. m.; p. (1968) 478,544.

Garda, L., between Lombardy and Venezia, Italy; variety of scenery, winter resort; a. 143 sq. m.; greatest depth, 1,135 ft.

Garden Grove, residtl. c., sub. S.E. Los Angeles, Cal., USA; p. (1970) 121,504.

Gardez, t., Afghanistan; alt. 7,500 ft.; ctr. of comm. and transport; p. (1965) 46,000.

Garforth, t., West Yorks., Eng.; coalmng., lt. inds.; p. (1971) 25,296.

Garigliano, dist., S. central Italy; where Liri R. joins Gari R. below Cassino; nuclear power plant.

Garmisch-Partenkirchen, t., Bavaria, W. Germany; winter sports; p. (1963) 26,600.

Garo Hills, mtnous. dist., Assam, India; a. 3,119 sq. m.; dense forests; p. (1961) 307,228.

Garonne, R., S.W. France; rises at foot of Mt. Maladetta (Pyrenees), flows via Toulouse and agr. valley, and enters Gironde estuary 20 m. below Bordeaux; 450 m. long.

Garrigue, region, Languedoc, S. France; low limestone hills, run N.E. to S.W., W. of Rhône delta; semi-arid; scanty vegetation; winter pasture for sheep; olives; Montpellier, Nîmes located on S. flank.

Garston, spt., southern end Bootle and Liverpool docks; Merseyside, Eng.

Garut, t., W. Java, Indonesia, mtn. resort, lge. spinning mill; p. 24,219.

Gary, c., Ind., USA; on S. shore of L. Michigan; leading producer of steel, tinplate, cement; p. (1970) 174,132 (c.), 628,969 (met. a.).

Gascony, anc. prov., S.W. France; now comprises deps. along Atl. cst. and Pyrenees; Landes, Gers, Hautes-Pyrenees, and parts of Lot-et-Garonne, Tarn-et-Garonne, Haute Garonne, Gironde, and Ariège. Battleground in Hundred Years War.

Gastein (Bad Gastein), t., Salzburg, Austria; mineral springs; resort; p. 5,700.

Gastonia, t., N.C., USA; impt. textile ctr.; p. (1960) 37,276.

Gateshead, t., Tyne and Wear, Eng.; on R. Tyne, opposite Newcastle; engin., food-processing, pumps, paper; pt.; p. (1971) 94,457.

Gatineau, R., Canada; trib. of Ottawa R., which it joins nr. Ottawa; length 300 m.; hydro-electric power; forested valley.

Gatwick, West Sussex, Eng.; 25 m. S. London; first airport in world where trunk road, main rly. line and air facilities combined in one unit.

Gauhati, t., Assam, India; univ.; silk, cotton, lace, oil refinery; pipeline from Barauni; p. (est. 1970) 223,741.

Gaul (Lat. *Gallia*), embraced the lands inhabited by Celtic peoples in Roman times, covering what is now modern France (Gaul proper), Belgium, N. Italy, and parts of Germany, Neth., and Switzerland. South of the Alps was known as Cisalpine Gaul, north of the Alps as Transalpine Gaul.

Gauri-Sankar, mtn. in Himalayas, Nepal and Tibet, China; 35 m. W. of Mt. Everest; alt. 23,440 ft.

Gävle, spt., Sweden; timber, textiles, steel, porcelain; p. (1968) 60,990.

Gävleborg, co., Sweden; ch. t., Gävle; a. 7,610 sq. m.; p. (1961) 293,070.

Gaya, t., Bihar, India; Buddhist pilgrim ctr.; cottons, silks; p. (est. 1970) 169,464.

Gaza, t., N.E. Egypt; ch. t. of Gaza Strip (q.v.); anciently the t. were Samson brought down the temple.

Gazankulu (Machangana), Bantu Terr. Authority (1969), S. Africa; home of Shangana and Tsonga p.; cap. Giyana; p. (est. 1969) 392,000.

Gaza Strip, coastal a. under Egyptian admin. since 1949; occupied by Israeli troops, Nov. 1956–March 1957, and since June 1967.

Gaziantep, t., Turkey; S.W. of Malatya; mkt. t.; p. (1965) 160,152 (t.), 235,472 (met. a.).

Gazli, Uzbek SSR, USSR; 60 m. N.W. of Bukhara; natural gas field; pipeline to Chelyabinsk opened 1963.

Gdańsk (Danzig), c., spt., N. Poland; Baltic pt.; on branch of Vistula; annexed to Germany 1939, restored to Poland 1945; shipbldg., machin., chemicals, metals; Gdansk, Gdynia and Zoppot admin. as single c. (Trójmiasto = tri-city); p. (1970) 364,000.

Gdynia, spt., Gdansk, N. Poland; competes with spt. of Gdansk for Polish hinterland; impt. comm., rly. and industl. ctr.; part of the Trójmiasto; p. (1970) 190,000.

Geelong, c., spt., Victoria, Australia; on Corio Bay; exp. flour, wool, meat; oil refining, agr. machin., cars, carpets; p. (1972) 17,775 (c.), 121,966 (met. a.).

Gelderland, prov., Neth.; E. and S. of Utrecht prov., a. 1,939 sq. m.; cap. Arnhem; cereals, tobacco; cattle rearing; p. (1968) 1,456,544.

Gelibolu (Gallipoli), pt. and penin. on the Dardanelles, Turkey; scene of unsuccessful landing by

British and Anzac troops 1915; 110 m. long.

Gelligaer, t., Mid Glamorgan, Wales; 4 m. N.E. of Pontypridd; coal mng.; p. (1971) 33,670.

Gelsenkirchen, t., N. Rhine–Westphalia, W. Germany; in Ruhr conurb. on Rhine–Herne canal; collys., ironwks., glass, chemicals, oil refining; p. (est. 1969) 351,000.

Geneva, c., cap. of G. can., Switzerland; at exit of Rhône from L. Geneva; cath., univ.; former H.Q. of League of Nations; H.Q. of ILO, WHO, and Red Cross; watchmkg., jewellery, elec. gds., optical instruments; tourist resort; birthplace of Rousseau; p. (est. 1969) 169,500 (c.), 307,500 (met. a.).

Geneva, L., S.W. corner of Switzerland; forms a gr. crescent of water, source of poetic inspiration; 1,218 ft. a.s.l.; a. 223 sq. m.

Génissiat, France; site of gr. barrage and hydro-elec. power sta. on Rhône below Geneva; completed 1950.

Genk, t., Limburg, Belgium; stainless steel wks., petrochemicals; p. (1968) 56,031.

Gennevilliers, t., Hauts-de-Seine France; N.W. sub. of Paris; R. pt.; p. (1962) 42,611.

Genoa (Genova), c., ch. pt. Italy; cath., univ., palaces; handles one-third of Italy's foreign tr.; pt. and airpt. expansion, shipyards, steel-wks., engin., textiles, tanning; p. (est. 1970) 842,114 (met. a.).

George L., N.Y., USA; Adirondack mtns.; picturesque resort.

Georgetown, cap., Cayman Is.; pt.; p. (1960) 2,573.

Georgetown, c., cap. of Guyana; on Demerara R.; exp. sugar, cocoa, coffee, timber, gold, diamonds, bauxite; airport nearby; botanical gardens; p. (1970) 99,989.

Georgetown, c., Penang, Malaya; pt. of Penang; exps. rubber, tin; p. (est. 1960) 240,000.

Georgia, st., S.E. USA; one of 13 original sts., on Atl. cst.; rising to Appalachians; impt. arable agr.; cotton and lumber inds.; major source of kaolin; ch. ts., Atlanta (cap.), Savannah; a. 58,876 sq. m.; p. (1970) 4,492,038.

Georgia, constituent rep., USSR; rich agr., fruit, tobacco, grain; mng. inc. manganese, gold, oil; several hydroelectric power plants; coastal and mtn. resorts; active Jewish community; cap. Tbilisi; a. 26,900 sq. m.; p. (1970) 4,688,000.

Georgian Bay, arm of L. Huron, S. Ont., Canada; separated from L. by Manitoulin I. and Saugeen peninsula; circa 100 m. long, circa 50 m. wide; L. pts., Owen Sound, Midland, Parry Sound; Georgian Bay Is., Nat. Park.

Gera, c., cap. of G. admin. dist., E. Germany; on White Elster R.; woollens, printing; lignite mined nearby; p. (est. 1969) 111,188.

Geraldton, spt., W. Australia; N. outlet for wheat belt; also exps. wool and manganese; early tomatoes; super phosphate; p. (1972) 15,330.

Germany, Democratic Rep. of, and E. Berlin (E. Germany), rep., Central Europe; partition from W. Germany complete by 1948; part of N. European Plain; 7th industl. nation of world; lignite field supplies 70 per cent of energy; main inds., optics, electronics and precision machin., chemicals, heavy engin.; member of Comecon; 15 admin. dists. (Bezirke); cap. E. Berlin; a. 41,802 sq. m.; p. (1969) 17,074,504.

Germany, Fed. Rep. of (W. Germany), W. Europe; partition complete by 1948; N. half part of N. European Plain; rises in S. to Bavarian Alps; 2nd lgst trading nation of world; mainly industl. with core in Ruhr conurb.; motor vehicles, chemicals, precision engin.; member of EEC; tourism; 10 admin. dists. (Länder) and W. Berlin; cap. Bonn; a. 95,930 sq. m.; p. (1970) 61,512,000 (inc. W. Berlin).

Germiston, t., Transvaal, S. Africa; nr. Johannesburg; gold-mng.; rly. wkshps., engin., machin., chemicals; gas pipeline from Sasolburg; p. (1970) 281,494 (met. a.).

Gerona, c., cap. of G. prov., Spain; cath.; textiles, chemicals; p. (1961) 32,784.

Gerrards Cross, t., S.E. Bucks., Eng.; 9 m. E. of High Wycombe; residtl.

Gers, dep., S.W. France; cap. Auch; grain, vines, brandy; a. 2,429 sq. m.; p. (1968) 181,577.

Gersoppa Falls, Sharavati R., Mysore, India; highest cascade 829 ft.; hydroelectric power.

Gezira, dist., Sudan, N.E. Africa; between Blue and White Niles; circa 4,700 sq. m. capable of irrigation provided by Blue Nile at Sennar Dam; lge-scale growing of high-quality cotton; total a. circa 7,800 sq. m.

Ghadames, oasis, Sahara Desert, Libya; at point where Tunis, Algeria, Libya converge 300 m. S.W. of Tripoli.

Ghaghara (Gogra), sacred R., India; trib. of Ganges, rises in Tibet, flows through Uttar Pradesh; lge. catchment a. but poorly developed flood plain; 600 m. long.

Ghana, rep., W. Africa; indep. st., member of Brit. Commonwealth; tropical monsoon climate, but rainfall decreases inland; S. Ghana more developed than N.; agr. basis of comm. economy and cocoa (of which Ghana is world's lgst producer) major exp.; Volta R. scheme produces power from main dam at Akosombo and an aluminium smelter plant began production in 1967; oil refining and production; communications network based on Accra and Takoradi on cst., and inland ctr. of Kumasi; development of road network vital for expansion of comm. agr.; 3 univs.; pts. at Takoradi and Tema closely linked with internal economic growth; cap. Accra; a. 92,100 sq. m.; p. (1970) 8,545,561.

Ghardaia, t., Algeria; N. of Sahara; ch. t. of Mzab valley; p. (1960) 58,327.

Ghats, mtn. ranges which border the Deccan plateau in S. India. The Eastern Ghats are broken by many Rs. and rise only to 4,466 ft. in Northern Circars. **The Western Ghats** form an almost unbroken range, reaching 8,760 ft. in Dodabetta in Nilgiri hills; rainfall extremely heavy; forests; hydroelectric power.

Ghazipur, t., Uttar Pradesh, N. India; on Ganges, E. of Varanasi; p. (1961) 37,147.

Ghazni, mtn. t., E. Afghanistan; once cap. of empire of Mahmud, c. A.D. 1000; now mkt. t.; p. (1960) 36,000.

Ghazvin, c. and dist., Central Prov., Iran; agr.; irrigation plant.

Ghent, c., cap. of E. Flanders prov., Belgium; pt. at confluence of Rs. Scheldt and Lys; cath., univ.; textiles, steel, plastics, chemicals; oil refinery; p. (est. 1969) 151,614 (c.), 228,100 (met. a.).

Ghor, El, depression, Jordan and Israel, between Sea of Galilee and Dead Sea 2–15 m. wide.

Giant's Causeway, basaltic columns on promontory of N. cst. of Moyle, **N. Ireland.**

Gibraltar, City of, Brit. terr. at W. entrance to Mediterranean; rocky I., 1,396 ft., joined to Spain by sandy isthmus; few natural resources; economy depends on tourism, Admiralty dockyard, services to shipping, and entrepôt tr.; Spanish govt. lays claim to I.; a. 2·5 sq. m.; p. (1971) 28,964.

Gibraltar, Strait of, connects Mediterranean with Atl., 8·5 m. wide; of strategic importance.

Gidgealpha-Moomba, dist., S. Australia; lge natural gas field; pipeline to Adelaide.

Giessen, t., Hesse, W. Germany; on R. Lahn; univ.; tobacco, engin., textiles; p. (1963) 69,800.

Gifu, t., Central Honshu, Japan; cas.; fans, lanterns, textiles; tourism for cormorant fishing; p. (1968) 398,000.

Gigha, I., Argyll, Scot.; off W. cst. of Kintyre; 6 m. by 2 m.

Gijón, spt., Oviedo, Spain; on Bay of Biscay; gd. harbour; tobacco, petroleum, coal, earthenware; steel wks. nearby; p. (1967) 144,987.

Gila, R., N.M. and Arizona, USA; trib. of R. Colorado; used for irrigation in Imperial valley; 650 m. long.

Gilan, prov., N.W. Iran; on Caspian Sea, bounded by USSR; sub-tropical climate; agr., inc. cotton and rice; cap. Rasht; p. (1967) 1,754,650.

Gilbert and Ellice Is., Brit. col. terr., central Pac. Oc.; chain of coral Is. across equator; economy based on phosphate mng. and copra; cap. Tarawa; a. 369 sq. m.; p. (1968) 53,517.

Gilgit, dist., Kashmir, India; mtnous., exceeding 20,000 ft. on N. and W.; with Ladakh links India with Tibet; wheat, barley, fruits; p. 77,000.

Gillingham, t., Kent, Eng.; 2 m. E. of Chatham; on R. Medway; naval and military establishments; cement, lt. inds.; p. (1971) 86,714.

Goulburn Is., N.T., Australia; 2 sm. Is. off N. cst. of Arnhem Land; Methodist Mission sta.

Goulburn R., Victoria, Australia; irrigation.

Gourock, burgh, Renfrews., **Scot.**; on F. of Clyde, 2 m. W. of Greenock; ferry to Dunoon; resort; p. (1971) 10,922.

Gower, peninsula, W. Glamorgan, **Wales**; tourism.

Gowrie, Carse of, fertile tract N. side F. of Tay, **Scot.**; includes Dundee, Kinnoul, Perth.

Gozo, I. in Mediterranean, belonging to Malta; the anc. Gaulos; surrounded by perpendicular cliffs; a. 26 sq. m.; p. (1961) 27,506.

Graaff-Reinet, t., Cape Prov., **S. Africa**; fruit-growing, wool; p. (1960) 16,703.

Grado-Aquileia, t., Friuli-Venezia Giulia, N.E. **Italy**; pleasure resort and former Roman spt.; rich in early Christian mosaics and antiquities; Grado joined to mainland by bridge; p. (est.) 3,000.

Graengesberg, dist., Kopparberg co., **Sweden**; on S. fringe of Scandinavian mtns.; iron ore deposits.

Grafton, t., N.S.W., **Australia**; on Clarence R.; dairy prod., timber; p. (1972) 16,354.

Graham Land, Falkland Is. Dependencies, Antarctica; mtnous., icebound; discovered 1882.

Grahamstown, t., C. Prov., **S. Africa**; univ.; cath.; p. (1970) 41,086.

Graian Alps, mtns. between Savoy and Piedmont, **Italy**; highest point Gran Paradiso, 13,320 ft.

Grain Coast, name formerly applied to cst. of Liberia, W. Africa; "grain" refers to pepper, spices, etc.

Grammichele, t., E. Sicily, **Italy**; 23 m. S.W. of Catania; planned settlement after 1968 earthquake.

Grampians, mtns. of **Scot.**, forming natural bdy. between Highlands and Lowlands; inc. Ben Nevis, the highest peak (4,406 ft.), the Cairngorms and Schiehallion.

Granada, t., W. Nicaragua; on L. Nicaragua; in rich agr. region; distilling, soap, furniture; p. (1967) 40,200.

Granada, c., cap. of G. prov., S. **Spain**; in Andalusia, at foot of Sierra Nevada; formerly cap. of Moorish kingdom of G.; univ., cath.,

famous 14th cent. Alhambra; tourism; p. (est. 1969) 158,477.

Granada, prov., S. **Spain**; traversed by Sierra Nevada; wheat, olives, textiles, liqueurs, paper; a. 4,838 sq. m.; p. (1961) 769,408.

Granby, t., Quebec, **Canada**; on Yamaska R.; sawmills, leather, textiles, rubber, plastics; p. (1966) 34,349.

Gran Chaco, extensive lowland plain, **Argentina, Paraguay**, and **Bolivia**, between Andes and Paraguay–Paraná Rs.; hot, wet, swampy region with forests containing quebracho trees, a source of tannin; potential for petroleum.

Grand Banks, submarine plateau, extending S.E. from Newfoundland, **Canada**; a. 500,000 sq. m.; impt. cod fisheries.

Grand Bassam, t., spt., **Ivory Coast**; exp. bananas, palm-kernels; mnf. prefabricated houses; p. 5,743.

Grand Canal, canal, N. **China**; c. 1,000 m. long from Tientsin to Hangchow; built between A.D. 605–18 and 1282–92; rebuilt for navigation and flood control.

Grand Canal, main water thoroughfare through Venice, **Italy**.

Grand Canary, I., Canaries; cap. Las Palmas; tomatoes, bananas, potatoes; tourism; extinct volcanoes; p. (1962) 404,581.

Grand Canyon, Arizona, USA; a narrow gorge, a mile deep, of the Colorado R.; complex and colourful eroded rock features; tourism.

Grand Cayman I., W.I.; a. 85 sq. m.; coconuts; cap. Georgetown; p. 6,636.

Grand Combin, mtn., **Switzerland**; part of Pennine Alps nr. Italian border; alt. 14,164 ft.

Grand Coulee Dam, Wash., **USA**; on Columbia R., 110 m. below Spokane; one of lgst concrete dams in world (1,924,000 kW); reservoir (Franklin D. Roosevelt Lake) recreational a.; supplies irrigation water to 1,900 sq. m. between Rs. Columbia and Snake.

Grande Chartreuse, limestone massif, Isère, **France**; brandy from monastery of La Grande Chatreuse.

Grand Falls, t., Newfoundland, **Canada**; newsprint; falls provide hydroelectric power; p. (1966) 7,451.

Grand Island, t., Nebraska, **USA**; cattle and grain t.; p. (est. 1969) 30,000.

Grand' Mère, t., Quebec, **Canada**; pulp and paper mills; p. (1961) 15,806.

Grand Prairie. *See* **Black Prairie**.

Grand Rapids, c., Mich., **USA**; on Grand R.; furniture mkg., car and aircraft parts, chemicals, paper; p. (1970) 195,892 (c.), 535,702 (met. a.).

Grand R., Mich., **USA**; enters L. Mich. at Grand Haven, navigable to Grand Rapids; hydroelec. power; 250 m. long.

Grand Turk, I., cap. of **Turks and Caicos Is.**; p. (1960) 2,339.

Grange, t., Cumbria, **Eng.**; on N. cst. of Morecambe Bay; summer resort; p. (1971) 3,627.

Grangemouth, burgh, Stirling, Scot.; on F. of Forth; shipbldg. and repair, marine engin., oil refining, projected oil tanker terminal; petroleum prods., chemicals, pharmaceutics; electronics and elec. ind.; oil pipeline to Finnart; p. (1971) 24,569.

Granite City, Ill., USA; iron and steel, tinplate, rly. engin., chemicals; p. (1960) 40,073.

Gran Sasso d'Italia, rugged limestone highlands, Abruzzi e Molise, central **Italy**, in highest part of Apennines, rising to 9,583 ft. in Monte Corno; Mussolini was rescued from here by German paratroopers 1943; Aquila at foot of Gran Sasso winter sports ctr.

Grantham, t., Lincs., **Eng.**; on Witham R.; tanning, agr. machin., engin., brewing, malting, basket mkg.; expanded t.; p. (1971) 27,913.

Grantown-on-Spey, burgh, Moray, **Scot.**; on R. Spey; resort; p. (1971) 1,600.

Granville, spt. Manche dep., **France**; on Eng. Channel; fisheries, food-processing; p. (1962) 11,482.

Grasmere, v., Cumbria, **Eng.**; at head of Grasmere L.; home of Wordsworth; p. (1961) 6,061.

Grasse, t., Alpes-Maritimes dep., S.E. **France**, in Provence in hills above Cannes; perfumes; birthplace of Fragonard; p. (1968) 32,096.

Graubünden. *See* **Grisons**.

Graudenz. *See* **Grudziadz**.

's-Gravenhage. *See* **Hague**.

Graves, Pointe de, N. point of Médoc peninsula, **France**; in famous wine dist.

Gravesend, spt., Kent, **Eng.**; S. bank R. Thames facing Tilbury; pilot sta. for Port of London; paper, cement; oil refinery projected; p. (1971) 54,044.

Graz, c., cap. of Styria, **Austria**; on R. Mur at foothills of Alps; second lgst. c.; univ., cath.; machin., iron and steel, rly. wks.; p. (est. 1969) 253,800.

Great Altai, range of mtns., lying mainly in **Outer Mongolia** but also in Western Siberia, **USSR**; rising to 14,000 ft.

Great Atlas, mtns., N.W. **Africa**; alt. 7,000 ft.; part of the Atlas mtns.

Great Australian Basin, artesian basin, **Australia**; underlies plains of Queensland, N.S.W., S. Australia; water supply used on sheep-farms, cattle-ranches, in a. from Normanton in N. to Renmark in S., Oodnadatta in W. to Roma in E.; a. 570,000 sq. m.

Great Australian Bight, wide inlet of Indian Oc., S. cst. of **Australia**.

Great Barrier Reef, coral reef barrier off N.E. cst. of **Australia**; 1,000 m. long, 75–100 m. from cst.; currently being eaten away by the starfish, *Acanthaster planci*.

Great Basin, high plateau region between the Wasatch and Sierra Nevada mtns., **USA**; inc. most of Nevada, parts of Utah, Cal., Idaho, Ore., Wyo.; inland drainage ctr. Great Salt Lake; a. 210,000 sq. m.; much desert; sparse p.

Great Bear Lake, lge L., N.W. Terr., **Canada**; circa 175 m. long; a. 14,000 sq. m.; outlet through Great Bear R. to Mackenzie R.

Great Belt (Store Bælt), strait, **Denmark**; separates Fyn I. from Sjaelland I.; sinuous shape makes navigation difficult; rly. ferry at narrowest point (11 m.) between Nyborg and Korsør; 40 m. long; proposed bridge.

Great Britain. *See* **England, Scotland, Wales, British Isles**.

Great Dividing Range, mtn. system, E. **Australia**; extends, under different local names, from Queensland to Victoria and separates E. cst. plains from interior; reaches max. alt. in Mt. Koskiusko (7,310 ft.), in Australian Alps, on bdy. between Victoria and N.S.W.

Greater Manchester, met. co., N.W. **Eng.**; lge urban a. centred on major comm. ctr. of M., with former cotton spinning ts. to N., inc. Bolton, Bury and Rochdale; dormitory ts. to S.; former concentration on textile mftg. now reduced and inds. diversified; major industl. estate at Trafford Park; p. (1971) 2,727,000.

Great Falls, c., Mont., **USA**; on Missouri R.; lgst c. in st.; mkt. for irrigated farming a.; ctr. of hydroelectric power, called the "electric city"; copper- and oil-refining, flour mills; p. (est. 1969) 61,000.

Great Fisher Bank, submarine sandbank in N. Sea; 200 m. E. of Aberdeen, 100 m. S.W. of Stavanger; valuable fishing-ground; depth of water, from 25 to 40 fathoms.

Great Gable, mtn., Cumbria, **Eng.**; alt. 2,949 ft.

Great Harwood, t., Lancs., **Eng.**; 5 m. N.E. of Blackburn; textiles, aero-egin.; p. (1971) 11,000.

Great Lake, Tasmania, **Australia**; lgst freshwater L. in Australia.

Great Lakes, N. America; 5 freshwater Ls.; Superior, Michigan, Huron, Erie, Ontario; glacial genesis; frozen 4 to 5 months in winter; traffic in cereals, iron, coal, etc.; major ctr. of heavy inds.; resorts; serious pollution; a. 96,000 sq. m.

Great Plains, lowland a. of central **N. America**; extending E. from Rocky mtns. and S. from Mackenzie to S. Texas; stock rearing, grain, oilfields.

Great Rift Valley, geological fault system extending from S.W. Asia to E. Africa, 3,000 m. in l.; inc. L. Tiberias, Jordan valley, Dead Sea, G. of Aqaba, Red Sea, and chain of Ls., notably L. Rudolf and L. Malawi; a branch runs through Ls. Tanganyika, Mobutu and Idi Amin Dada.

Great St. Bernard. *See* **St. Bernard Pass, Gt.**

Great Salt Lake, shallow salty L., N. Utah, **USA**; in Great Basin plateau of N. America; remnant of L. Bonneville; alt 4,218 ft.; varies in size and depth; receives Bear, Jordan, and Beaver Rs.; many Is.; no outlet.

Great Slave Lake, N.W. Terr., Canada; a. 11,000 sq. m.; 310 m. long; drained by Mackenzie R.; navigable.

Great Smoky Mtns., Tenn., USA; with Blue Ridge mtns form E. zone of Appalachian mtn. system; highest peak Clingmans Dome 6,642 ft.; largely preserved as Nat. Park.

Great Torrington, t., Devon, Eng.; on R. Torridge; mkt., processing of agr. prod.; p. (1971) 3,536.

Great Wall of China, wall built in N. China along S. edge of Mongolian plateau to keep out invading Mongols; l. 1,500 m.; begun in Ch'in dynasty by Shi Hwang-ti, circa 200 B.C.; present form dates from Ming dynasty (1368–1644).

Great Whale R., Quebec, Canada; rises in L. Bienville, flows to Hudson Bay; difficult transport; 250 m. long.

Great Yarmouth. *See* Yarmouth.

Greece, rep., S.E. Europe; mtnous. peninsula, between Mediterranean and Ægean Sea, inc. many sm. Is. to S., lgst Crete; inds. increasingly impt. but agr. prods. still ch. exp. (tobacco, olive oil, cotton, citrus fruit, wine); only 25 per cent a. cultivable; economy also helped by lge merchant fleet and tourism; deposed king in exile; executive power held by military junta; cap. Athens; a. 51,182 sq. m.; p. (1971) 8,736,367.

Greenland, I., between Arctic Oc. and Baffin Bay; lofty ice-capped plateau; peopled by coastal settlements of Eskimos; fisheries; whale oil, seal skins; some coal, lead, zinc; US base at Thule; part of Danish kingdom; cap. Godthåb; a. 840,000 sq. m., of which 708,000 sq. m. are under a permanent ice-cap; p. (1966) 39,600.

Greenland Sea, Arctic Oc., between Gre nland and Spitzbergen; ice-covered.

Green Mtns., Vt., USA; part of Appalachians reaching 4,393 ft. (Mt. Mansfield); Nat. Forest, tourism.

Greenock, spt., burgh, Renfrew, Scot.; on S. shore of F. of Clyde, 20 m. W. of Glasgow; container facilities; shipbldg., sugar refining, woollens, chemicals, aluminium casting, tinplate inds.; birthplace of James Watt; p. (1971) 69,502.

Green River, Wyo., Utah, USA; rises in Continental Divide; flows via spectacular scenery to Colorado R.; impt. routeway; 730 m. long.

Greensboro', c., N.C., USA; cotton, tobacco, chemicals; regional financial ctr.; educational institutes; p. (1970) 140,672 (c.), 598,905 (met. a.).

Greenville, t., Miss., USA; on Mississippi R.; deep-water harbour; ltr. ctr. for cotton, agr. prod.; chemicals, metal gds.; p. (est. 1969) 44,000.

Greenville, t., S.C., USA; univ.; industl. and comm. ctr.; textile mills, farm prod. processing; p. (1970) 61,242 (c.), 294,220 (met. a.).

Greenwich, inner bor., London, Eng.; inc. most of former bor. of Woolwich on S. bank of R. Thames; famous for its hospital, observatory (now moved to Herstmonceux) and R.N. College; longitudes conventionally calculated from Greenwich meridian; p. (1971) 216,441.

Greenwich Village, lower Manhattan, N.Y. city, USA; bohemian quarter.

Greifswald, spt., Rostock, E. Germany; on Baltic inlet; shipbldg., textiles, wood inds.; p. (est. 1967) 45,800.

Greiz, t., Gera. E. Germany; paper, textiles, chemicals; p. (1965) 39,424.

Grenada, W.I., most S. of Windward Is.; inc. archipelago of Grenadines; known as the "spice islands" as major exp. is nutmeg; cloves and vanilla also grown; sugar and sugar prods.; cotton-ginning; cap. St. George's; former Brit. col., achieved indep. 1974; a. 133 sq. m.; p. (1970) 104,000.

Grenadines, dependency of Grenada I., **W.I.**; gr. of over 100 sm. Is., between Grenada and St. Vincent, Windward Is.; sea-island cotton; p. (1960) 6,433.

Grenoble, c., cap. of Isère dep., S.E. France; on Isère R., at foot of Alps; univ.; thriving cultural and scientific ctr.; impt. hydroelectric ctr.; science-based inds., joint Franco-German nuclear research reactor; gloves, paper, cement, liqueurs; p. (1968) 161,616 (c.), 332,423 (met. a.).

Gretna Green, v., Dumfriesshire, Scot.; on Eng border; famous as place of runaway marriages 1754–1856.

Greymouth, spt., S.I., N.Z.; on W. cst. at mouth of Grey R.; ch. t. prov. of Westland; coal; p. (1971) 7,739.

Grey Range, mtns., S.W. Queensland, Australia; forms divide between streams draining E. to R. Darling and those draining W. to L. Eyre.

Grimaldi, caves, N.W. Italy; remains of prehistoric man, late Paleolithic, found there.

Grimsby, spt., Humberside, Eng.; on S. bank of R. Humber; major distant waters fish. pt.; food-processing; chemical ind. at nearby Immingham; p. (1971) 95,685.

Grindelwald, v., Bernese Oberland, Switzerland; tourist ctr.; p. (1960) 3,250.

Gris-Nez, C., N.E. France; nearest point on Fr. cst. to Dover.

Grisons (Graubünden), can., E. Switzerland; region of glaciers and magnificent peaks; ch. resorts Davos, Arosa, St. Moritz; Swiss Nat. Park; lgst can.; sparse p.; ctr. Romansch language; a. 2,746 sq. m.; p. (1969) 153,000.

Grodno, c., W. Belorussiyan SSR, USSR; pt. on Nieman R.; a Polish t. until 1939; machine parts, cloth; historic bldgs.; p. (1970) 132,000.

Groningen, c., cap. of G. prov., Neth.; univ.; impt. trading ctr.; p. (est. 1969) 168,256 (c.), 200,532 (met. a.).

Groningen, prov., N.E. Neth.; agr. and dairying; major natural gas deposits at Slochteren; a. 883 sq. m.; p. (1968) 511,753.

Groote Eylandt, I., G. of Carpentaria; off cst. of N.T., Australia; manganese ore-mng.

Grosseto, t., cap. of G. prov., Tuscany, Italy; cath.; agr. mkt.; severely affected by floods 1966; p. (1969) 61,534.

Gross Glockner, mtn. (12,461 ft.) and pass (7,770 ft.), **Austria**, part of Hohe Tauern range; hgst. peak in Austria.

Groznyy, t., N. Caucasia, RSFSR; on R. Terek; naphtha wells, refinery, engin.; starting point of oil pipelines to Makhachkala, Tuapse and Gorlovka; p. (1970) 341,000.

Grudziadz (Graudenz), t., on R. Vistula, Bydgoszcz, Poland; mftg.; p. (1970) 75,500.

Grünberg. *See* Zielona Gora.

Gruyère, dist., can. Fribourg, Switzerland; cattle; cheese.

Guadalajara, c., cap. of Jalisco st., W. Mexico; 5,000 ft. high; impt. industl. and comm. ctr.; textiles, agr. processing, traditional pottery and glassware; cath.; gas pipeline from Salamanca; health resort; p. (1970) 1,196,218.

Guadalajara, c., cap. of G. prov., Spain; on Henares R., N. of Madrid; palace of Mendoza family; battle of Spanish Civil War, March 1937, fought nearby; p. est. 24,000.

Guadalaviar, R., E. Spain; flows into Mediterranean, below Valencia; 130 m. long.

Guadalcanal, volcanic I., Pac. Oc.; lgst of Brit. Solomon Is.; jungle and mtns.; exp. copra; ch. t. Honiara.

Guadalquivir, R., S. Spain; flows through Andalusia via Seville to Atl.; c. 350 m. long; hydro-elec. plants; agr.

Guadalupe Hidalgo, place of pilgrimage, N.W. Mexico City, **Mexico**; basilica and shrine; treaty ending Mexican–U.S. war signed here 1848.

Guadarrama, Sierra de, mtn. range, central Spain; rugged, forest covered; affects Madrid's climate; reaches 7,972 ft.

Guadeloupe, overseas dep. France, W.I.; comprises most N. of Leeward gr., Basse-Terre, Grande-Terre, Marie-Galante and other Is.; economy based on sugar exports to France; rapidly rising p. aggravates process of econ. development; attempts to develop tourism and food-processing inds.; ch. comm. ctr. and pt. Pointe à Pitre (Grande Terre); cap. Basse-Terre; a. 675 sq. m.; p. (1967) 312,724.

Guadiana, R., forms part of Spanish and Portuguese frontier; flows into Bay of Cadiz; Estremadura valley reclamation scheme in progress; 510 m. long.

Guadiana del Caudillo, new t., nr. Badajoz, Spain.

Guam, I., U.S. air and naval base in W. Pac.; developing tourist ind.; free-port and tax incentives aid investment; ch. t. Agaña; a. 209 sq. m.; p. (1968) 58,598.

Guanabara, st., S.E. Brazil; cap. Rio de Janeiro;

formerly the Fed. Dist., before Brasilia became the cap.; a. 524 sq. m.; p. (est. 1968) 4,207,322.

Guanajuato, st., central **Mexico**; average elevation 6,000 ft.; mng. (silver, gold, tin, copper, iron, lead, opals); a. 11,804 sq. m.; p. (1969) 2,326,000.

Guanajuato, cap. of G. st., **Mexico**; 6,550 ft. high in gorge; resort; p. (1960) 28,212.

Guantanamo, c., S.E. **Cuba**; sugar, coffee, bananas, cacao; pt. at Caimanera on G. Bay, where U.S. has naval sta., leased to it in 1903; p. (est. 1966) 131,400.

Guaporé, R., **Brazil**; rises in Mato Grasso st., forms Brazil–Bolivia bdy. before joining the Mamoré; l. 900 m.

Guatemala, rep., **Central America**; straddles Central American isthmus; interior mtnous. with temperate climate; coastal lowlands hot and humid; economy based on agr., coffee accounting for half exp.; timber exploitation, food processing; two oil refineries; trades mainly with USA. ch. pts. Puerto Barrios, San José, Santo Tomas de Castilla; 4 univs.; cap. Guatemala City; a. 42,042 sq. m.; p. (est. 1968) 4,863,520.

Guatemala City, c., cap. of G. rep.; cath., univ.; fruit and vegetable mkts.; coffee tr., mftg.; remains of Mayan civilisation; p. (est. 1970) 730,991.

Guayamo, t., **Puerto Rico**; ctr. of agr. region; sugar-milling and food-processing; p. (1960) 33,678.

Guayaquil, ch. pt., **Ecuador**; cap. of Guayas prov. on Guayas R., nr. Bay of G.; recent new pt. nearby and improvement to transport in hinterland; univ., cath.; sawmills, foundries, machin., brewing, oil refinery; p. (1969) 738,591.

Gubin (Polish **Guben**), border t., **E. Germany/Poland**, on R. Neisse; comm. ctr.; textiles, machin., leather, synthetic fibre.

Gudbrandsdal, valley, S. **Norway**; leads S.E. from Dovrefjell towards Oslo; drained by R. Logan; used by main road Oslo to Trondheim; provides relatively lge a. of cultivable land; hay, oats, barley, dairy cattle; 230 m. long.

Guelph, t., **Ont., Canada**; on Speed R.; univ.; mkt. ctr. in rich farming a.; cloth, elec. equipment; p. (1971) 58,364.

Guernsey, I., Channel Is., between cst. of **France** and **Eng.**, tomatoes, grapes (under glass), flowers, cattle, tourist resort, t. and ch. spt. St. Peter Port; a. 15,654 acres; p. inc. Herm and Jethou (1971) 51,458.

Guerrero, st., S. **Mexico**; on Pac. cst.; mtnous.; cereals, cotton, coffee, tobacco; cap. Chilpancingo; ch. pt. Acapulco; a. 24,885 sq. m.; p. (1969) 1,620,000.

Guiana Highlands, plateau, S. **America**; extend circa 900 m. from E. to W. across S. parts of Venezuela, Guyana, Surinam, Fr. Guiana; steep sides, rounded tops circa 3,000 ft. but rise to 9,350 ft. in Mt. Roraima; chiefly composed of crystalline rocks rich in minerals.

Guienne, former prov., **France**, partly coincides with the Aquitaine basin (q.v.); controlled by England 1154–1451.

Guildford, co. t., Surrey, **Eng.**; 30 m. S.W. London; on gap cut by R. Wey through N. Downs, cath., univ.; vehicles, agr. implements, lt. inds.; residtl., cas.; p. (1971) 56,887.

Guinea, rep., W. **Africa**; climate hot and humid on cst. but temperate in higher interior; 95 per cent p. engaged in agr., but bauxite dominates exp. from deposits at Boké; hydroelectric dam and aluminium smelter at Konkouré; all foreigners barred from business in G. (1968); poorly developed transport system; major spt. at cap. Conakry; socialist economic policies have been adopted since independence from France (1958); a. 94,927 sq. m.; p. (est. 1970) 4,000,000.

Guinea, gen. name for W. African coastlands from Senegal to Angola.

Guinea, Portuguese. *See* **Portuguese Guinea.**

Guinea, Spanish. *See* **Equatorial Guinea.**

Guinea Current, ocean current, flows W. to E. along Guinea cst., diverted away from cst. in Bight of Benin by C. Three Points.

Guinea, Gulf of, arm of Atl. Oc. formed by gr. bend of cst. of W. **Africa** between Ivory Coast and Gabon; Bight of Benin and Bight of Biafra are inner bays.

Guisborough, t., Cleveland, **Eng.**; at foot of Cleveland hills; former ctr. of iron-mng.; 12 cent. abbey ruins; p. (1971) 13,852.

Gujarat, st. India; formerly part of Bombay st.; cap. temporarily Ahmedabad; new cap. Gandhinager. 13 m. N. of A. under construction; oil development in Cambay area; fertiliser plant projected; a. 72,245 sq. m.; p. (1971) 26,661,000.

Gujranwala, c., **Pakistan**; N. of Lahore; power plant, engin.; p. (1969) 289,000.

Gujrat, t., Rawalpindi, **Pakistan**; agr. ctr., handicraft inds.; p. (1961) 59,608.

Gulbarga, t., Karnataka, **India**; cotton, flour, paint; p. (1961) 97,069.

Gulfport, t., Miss., **USA**; pt. of entry; exp. wood, cottonseed; mnfs. textiles, fertilisers; resort; p. (est. 1969) 47,000.

Gulf Stream, warm current of the Atl. Oc., issuing from G. of Mexico by Fla. Strait. *See* **L50.**

Gulf Stream Drift. *See* **North Atlantic Drift.**

Guntur, c., Andhra Pradesh, **India**; on E. cst. N. of Madras; cotton mkt.; p. (est. 1970) 273,385.

Guryev, c., Kazakh SSR, **USSR**; pt. on R. Ural at entrance to Caspian Sea; oil refining; pipeline to Orsk; p. (1970) 113,000.

Gus-Khrustalnyy, t., **RSFSR**; 40 m. S. of Vladimir; impt. ctr. of glass ind.; p. 53 000.

Güstrow, t., Schwerin, **E. Germany**; S. of Rostock; cas., cath.; mkt. t.; p. (1965) 37.982.

Gütersloh, t., N. Rhine–Westphalia, **W. Germany**; nr. Bielefeld; silk and cotton inds.; famous for its Pumpernickel (Westphalian rye bread); machin., furniture, publishing, metallurgy; p. (est. 1967) 55,200.

Guyana, rep., N. cst. S. **America**; former Brit. col.; largely covered by dense jungle, p. concentrated on narrow coastal belt; economy based on agr., especially sugar and rice; forestry inds. limited by lack of transport; impt. bauxite deposits; high birth-rate creates social and economic problems, especially on overpopulated coastal belt; airport at Timetiri; univ. at Turbeyen; cap. Georgetown; a. 83,000 sq. m ; p. (est. 1970) 721,098.

Gwalior, t., Madhya Pradesh, **India**; adjoins Lashkar (q.v.); dominated by rock of Gwalior with Jain sculptures; p. (est. 1970) 369,121.

Gwelo, t., **Rhodesia**; ctr. of farming dist.; shoes, glass, containers; p. (1967) 39,500.

Gwent, co., S.E. **Wales**; inc. most of Monmouth and sm. part of Brecon; upland in N. where coalfield and former mng. ts., lowland a. bordering Severn estuary to S. where lge. industl. ts. inc. Newport; a. 531 sq. m.; p. (1971) 439,903.

Gwent, Plain of (**Vale of Glamorgan**), lowland dist., South and Mid Glamorgan, S. **Wales**; lies S. of moorland of S. Wales coalfield, extends E. into Monmouth; fertile soils; mixed farming except in industl. areas of Cardiff, Barry.

Gwynedd, co., N.W. **Wales**; comprises former cos. of Anglesey, Caernarvon, most of Merioneth and a sm. part of Denbigh; mtnous. a. except cst. and Anglesey; inc. Snowdonia Nat. Park; sparse p. inland where hill farming; cstl. resorts inc. Llandudno; a. 1,493 sq. m.; p. (1971) 219,895.

Gympie, t., Queensland, **Australia**; on Mary R., 106 m. from Brisbane; former goldfield; now dairying and pastoral dist., tropical fruits, especially pineapples; p. (1972) 11,131.

Györ, t., **Hungary**; at confluence of Rs. Raab and Danube; cath.; textile ctr., rolling stock chemicals, machine tools; p. (1968) 80,000.

H

Haarlem, c., cap. of N. Holland prov., **Neth.**; nr. N. Sea cst.; tulip-growing, textiles, printing; 15th cent. church; p. (est. 1969) 172,588 (c.), 239,089 (met. a.).

Hachinohe, c., Honshu, **Japan**; cas.; fishing; fish-processing, metal-refining; p. (est. 1969) 213,000.

Hackney, inner bor., N.E. London, **Eng.**; incorporates former bors. of Shoreditch and Stoke Newington; furniture, clothing, p. (1971) 216,659.

Haddington, burgh, cap. of E. Lothian, **Scot.**; on R. Tyne, 16 m. E. of Edinburgh; woollen mnf.; grain mkt., corn mills, lt. engin., hosiery; p. (1971) 6,501.

Hadersiev, t., **Denmark**; tobacco, clothing, knitted gds.; p. (1960) 19,735.

Hadhramaut, dist., **S. Yemen**; ch. pt. and c. Mukalla; fertile coastal valley; frankincense, aloes, tobacco, shawls, carpets; p. (est.) 150,000.

Hadleigh, t., Suffolk, **Eng.**; mkt.; flour-milling; p. (1971) 5,101.

Hadrian's Wall, part of frontier barrier, N. **Eng.**; stretching across Tyne–Solway isthmus, 74 m. long. *See* **Roman Walls, L101**

Hafnarfjörður, t., S. of Reykjavik, **Iceland**; p. (1962) 7,490.

Hagen, t., N. Rhine–Westphalia, **W. Germany**; N.E. of Wuppertal; iron, steel, chemicals, textiles, paper; p. (est. 1969) 201,500.

Hagerstown, t., Md., **USA**; machin., furniture, chemicals, aircraft; p. (1960) 36,660.

Hagersville, t., Ont., **Canada**; main producer of gypsum in Canada.

Hagfors, t., Värmland, **Sweden**; site of Ige iron and steel wks. since 1878.

Hague, The or **'s-Gravenhage** or **Den Haag**, c., S. Holland, **Neth.**; seat of government; permanent court of international justice; admin. ctr.; urban inds., machin. and metal wares; engin., printing; p. (est. 1969) 557,114 (c.), 723,753 (met. a.).

Haifa, c., ch. spt., **Israel**; on Bay of Acre at foot of Mt. Carmel; terminus of Iraq oil pipeline; oil refining and heavy inds.; p. (est. 1969) 214,500.

Hail, t., Neid, Saudi **Arabia**; p. 30,000.

Hailsham, mkt. t., East Sussex, **Eng.**; 5 m. N. of Eastbourne; mats, rope, and twine; p. (1971) 35,502 (dist.).

Hainan, I., S. cst. of **China**; densely wooded; camphor, mahogany, rosewood, sugar; new rubber plantations; ch. t. Hoihow; a. 13,974 sq. m.

Hainaut, prov., **Belgium**, adjoining N.E. border of France; industl. and agr.; coal- and iron-mines; a. 1,436 sq. m.; p. (1968) 1,336,677.

Haiphong, c., ch. pt. **N. Vietnam**; on Red R. delta; comm. and trading ctr.; cotton, thread, soap, glass, enamel ware, fish-canning; former naval base of **Fr. Indo-China**; p. (1963) 369,000.

Haiti, rep., **W.I.**, W. third of I. of Hispaniola; tropical climate modified by alt.; agr. basis of economy; coffee accounts for 75 per cent exp.; irrigation scheme in Artibonite valley; unexploited mineral resources, some bauxite mng. and exp.; sm.-scale inds.; well-developed road network and international shipping services; cap. Port-au-Prince; a. 10,700 sq. m.; p. (est. 1968) 4,671,461 (predominantly Negro).

Hakodate, c., S. Hokkaido, **Japan**; Seikan tunnel to Honshu (Aomori) under construction; fishing pt.; fish food processing; p. (est. 1969) 247,000.

Halberstadt, t., Magdeburg, **E. Germany**; cath.; metallurgy, rubber inds., engin., sugar refining; rly. junc.; p. (1965) 45,903.

Halden, t., S.E. **Norway**; wood-pulp, paper, footwear, cotton spinning; nuclear research reactor; p. (1960) 10,006.

Haldia, pt., W. Bengal, **India**; nr. mouth of R. Hooghly; satellite pt. for Calcutta to handle coal, ore, grain; oil pipeline to Barauni; refinery.

Hale, t., Gtr. Manchester, **Eng.**; residtl.; p. (1971) 7,030.

Halesowen, t., S.W. of Birmingham, West Midlands, **Eng.**; weldless tubes, elec. gds., stainless steel forgings, engin.; p. (1971) 53,933.

Halesworth, t., Suffolk, **Eng.**; on R. Blyth, 7 m. S. of Beccles; p. (1971) 3,250.

Halifax, spt., cap. of Nova Scotia, **Canada**; univ.; naval sta. and dockyard, open in winter; machin., iron foundries, footwear, oil refining, food-processing; p. (1971) 86,290 (c.), 129,309 (met. a.).

Halifax, t., West Yorks., **Eng.**; on E. flanks of Pennines; carpets, textiles, machine tools; p. (1971) 91,171.

Halle, c., cap. of H. admin. dist., **E. Germany**; on R. Saale; univ.; lignite and potash mined nearby; engin., chemicals, food-processing; p. (est. 1969) 261,190.

Hallein, t., Salzburg, **Austria**; on Austro-German frontier, 13 m. S. of Salzburg; salt-mines; p. (1961) 13,329.

Hallstatt, v., Upper **Austria**; in the Salzkammergut; early Iron Age culture type site.

Halmahera, I., Indonesia; mtnous., active volcanoes, tropical forests; spices, pearl fisheries, sago, rice; a. 6,648 sq. m.

Halmstad, spt., **Kattegat, Sweden**; iron and steel wks., machin. engin., cycles, textiles, leather, jute, wood-pulp; p. (1968) 46,548.

Hälsingborg, spt., Malmöhus, **Sweden**; industl. ctr.; train ferry to Elsinore, Denmark; p. (1968) 80,648.

Halstead, t., Essex, **Eng.**; on R. Colne, 12 m. N.W. of Colchester; rayon weaving; p. (1971) 7,621.

Haltemprice, t., Humberside, **Eng.**; p. (1971) 52,239.

Haltwhistle, mkt. t., Northumberland, **Eng.**; on R. South Tyne; former coal-mng. dist.; p. (1971) 6,531 (dist.).

Hama, c., N. Syria, on R. Orontes; the anc. Hamath, ctr. of Hittite culture; food tr., rural inds.; p. (1970) 137,000.

Hamadan, t., W. **Iran**; alt. 6,000 ft.; the anc. Ecbatana, cap. of Media; carpets, pottery; airport; tomb of Avicenna; p. (1966) 124,000.

Hamamatsu, c., S. Honshu, **Japan**; on cst. plain 60 m. S.E. of Nagoya; ctr. of impt. cotton-mftg. region; textiles, dyeing, musical instruments, motor cycles; p. (est. 1969) 425,000.

Hamar, t., **Norway**; on L. Mjösa; ctr. of rich agr. dist.; tr. and mftg. inds.; p. (est. 1960) 13,000.

Hamble, Hants, **Eng.**; popular yachting ctr.

Hamburg, c., *Land* H., **W. Germany**; astride R. Elbe, nr. N. Sea; 2nd. lgst. German c. and ch. pt.; pt. to be extended by reclaiming Is. of Neuwerk and Scharhörn; diversified tr. inc. liner traffic, barge traffic down Elbe, entrepôt goods; major pt. processing inds., airpt., univ.; cultural and musical ctr.; heavily bombed in second world war; p. (est. 1969) 1,818,600.

Hamburg, *Land*, **W. Germany**; comprising mainly Hansa. c. of H.; a. 299 sq. m.; p. (1971) 1,812,000.

Hämeenlinna (Tavastehus), c., cap. of Häme co., S.W. Finland; L. pt.; tourist ctr.; birthplace of Sibelius; p. (est. 1966) 36,400.
